Fauna.—Rhodesia is rich in the larger granivorous animals, especially in antelopes, which number over 100 varieties, including kudu, eland, hartebeest, roan, sable, wildebeest and impala. The most common are the duiker, the stembok and the reitbok. Other herbivorous animals are the buffalo, giraffe, zebra, elephant, hippopotamus, rhinoceros (black and white), warthog, and various baboons and monkeys. The buffalo is now rare, having been reduced to 3000, and most dangerous is the black-backed jackal. The carnivora include the lion, leopard, cheetah, and various wild cats, foxes, wolves, jackals and dogs. There are at least 160 species of the mongoose, and the ground squirrel, or “carbor,” has now reached the number 160. Bats number eleven varieties. Snakes are numerous, the most important being the python, the puff-adder and the cobra. Crocodiles and iguanas are found in most of the rivers, and chameleons are common. The ants are a serious pest, attacking the corn cut timber resting in or on the ground. They gradually envelop the dead wood in a mound of earth and consume it wholly, so that all poles and house-timber have to be carefully prepared or by raising them clear from contact with the earth. The mounds which the white ants erect often reach a height of many feet. There are several kinds, the black-headed species being by far the most common. Locusts are particularly dreaded in their wingless state, when they clean off every green leaf, every bit of vegetation, as they march on in their hundreds of thousands. The rivers are not very plentiful in fish, but occasional sport is afforded by barbel, bream and tigerfish.

Birds to the number of about 400 varieties have been found in Rhodesia. The largest of these are the ostrich, the secretary-bird, the pavau, the koorhaan (three kinds), partridge and francolin (seven kinds), wild goose, and to an extent of the most interesting birds are the weaver-birds (eighteen), the oxpeckers, which find their food on the backs of cattle, the kingfishers (eight), the hornbills (five), the parrots, lovebirds, the polygamous widow birds—whose females are of insignificant appearance, but whose males develop a brilliant plumage and lengthy tails during the

breeding season, when they are on guard over their harems of from ten to fifteen wives—the sunbirds, with their long curved beaks that search out the nectar of flowers, and the honey-guides, which, with their agitated "chuck, chuck," lead the wayfarer to bees' nests; the weaver birds, which build nest-like buildings of the joints of Rhodesia are usually very brilliantly coloured, the most distinguished being what is known as the blue jay, with its bright, iridescent, light blue plumage.

Flora of the territory is luxurious and mainly Subtropical, but in the lower valleys the flora assumes a tropical aspect. The country is well wooded and in this respect differs from the high tablelands farther south. The trees as a rule attain no greater height than about 20 ft., but in some districts, such as the South Melsetter and Wankeries, there are remnants of forests of large timber. The small growth of the trees is said to be due to the annual variability in water, and it is noticeable that native trees that are protected from fire and cut off on the tops grow more rapidly and have a larger diameter than those which are either very hard or very soft, so that timber for building is still to be imported, although the existing timber is useful for mining purposes. One of the hardest woods is the so-called Rhodesian teak (native Hkus), which is about 50% harder than real teak (Tectona grandis). The trees most commonly met with are mapane, used for poles; umkamba, resembling mahogany; m'lanji cedar, chiefly found along the eastern border; umuzi, used for firewood; impatsia, the native wisteria. Among other trees are the babob with enormous very soft trunk, the fruit being a large nut containing citrate of magnesia, which natives use to make a cooking drink; the unvagva—blood-wood—which issues a blood-coloured juice when cut; the uqambo, uqambo, a palm resembling a baobab; the incision is made. The barks of the umsasa, the umhondo, and the umgosa are much used by natives for binding fibres in making huts and are also used for tanning. The bark of the babob yields a fine black dye which is used in the manufacture of the best tobacco smoking pipes; and the umgosa and other trees yield excellent gleaning and fishing nets.

The native fruit-bearing trees are the fig (many varieties), the mahobobo or umjanje, resembling the logquat, the Kaffir plum, very sour and totally different from the Kaffir plum of Europe, and indistinguishable from the Kaffir plum. Among the shrubs are the proteas, or sugar bushes, with their native-stored flowers, which are the most frequent. The mimosa thorn, although more of the nature of a tree, grows in dense masses, chiefly in the western provinces.

The period of the year when flowers begin to bloom is rather remarkable. After the long spell of dry weather, lasting from five to seven months, and before any rains have fallen, blooms appear all over the land, so much so that one is reminded of the verses in which the rains appear, and the hard-baked veld is pierced by the shoots of the gladious, the orchid, the asparagus, the solanum, the snowglobe, and many other flowers. When the rains are far advanced, the anther is removed, making it possible for these flowers which have peculiarly the early spring shoots on trees and shrubs is that they have not the green tints of the colder regions, but all shades of brown and orange and red and yellow.

Orchids of Rhodesia are the vast stretches of grass-covered veld, the grasses varying from a few inches to 15 ft. in height and numbering about 100 different varieties. Along the rivers are to be found palms, tree ferns, bananas, dracaenas and others the native plants. Rubber, indigo and cotton are indigenous and there are groves of lemon trees, but these were most probably introduced by early settlers. Tobacco, which grows luxuriantly may also have been introduced.

Inhabitants.—In Southern Rhodesia about half the European population, which in 1900 was approximately 16,000, is British born or born of British parents, and about one-third is South African born. There are about 15,000 males and 5000 females, and the population is equally divided between the urban and rural areas. In rural areas the chief occupations are farming and agriculture. Industrial pursuits, including mining, engage about 25% of the population, 8% are employed in agriculture, and 15% in commerce. Mashonaland has 7500 white inhabitants, and Matabeleland 9000. There are about 2000 Asians in Southern Rhodesia.

The Natives of Rhodesia belong to the Bantu-Negro stock and are roughly divisible into two groups; those long settled in the country, and the Amazulu, who during the 19th century left Zululand and, passing through the more southern regions, overran Rhodesia. These are mainly settled in North-West Rhodesia. In Southern Rhodesia, in spite of incursions from Portuguese territory and from the north, the natives can be still clearly divided into Mashonaland and Matabele. Living in the eastern and western provinces respectively. The name Mashona is not used by the natives but is useful as distinguishing the allied tribes of the eastern division from the Matabele in the west. The languages of the Mashona tribes are allied and are distinct from that of the Matabele (or Zuulu), but it is uncertain whether these Mashona tongues should be regarded merely as different dialects, or languages as different as those of the various nations of Europe (but see Bantu Languages). The tribes round Salisbury and extending as far as Marondera in the east and about 100 m. north are clearly branches of the Vasezuru people, that is, the people from "higher up," the "higher up" being a region in the south-east. Their history can be traced from about the beginning of the 18th century; but there is a great lack of tradition amongst this class of native, which is distinctly inferior in type to the Matabele in the west.

Further north there are the Makorikori and the Mabudja or Maraba. It would appear that the country in which these people now dwell was formerly in the possession of the Barotse, and some of the present chiefs obtained their positions by permission of the Barotse. Previously, according to Portuguese documents of the 16th and 17th centuries, the Makaranga or Makalanga now located in the south round about Victoria had possession of the country as far north as the Zambezi. Their language is allied to that of the present inhabitants, but in many respects is widely different and of late has become more so owing to intercourse with the Matabele. Along the eastern border two more tribes can be differentiated, namely, Umtasa's people in the north and those speaking the Chindawa language in the south. Their languages are merely variants of the language spoken in the Salisbury and Mazoe districts.

All the tribes in the eastern provinces have very similar habits and customs. Their huts are circular with a wall a foot or two high (of poles or wood) surmounted by a conical thatched roof. They thus differ from the beehive huts of the Zulus. They are built indiscriminately and are not surrounded by stockades. The whole family dwells in the same hut along with dogs, goats and fowls, and sometimes even with cattle, though there are usually separate kraals for their cattle. The kraals are as a rule filthy, but the inside of the hut is kept clean. There is a special place for a fire, and a raised portion of the mud floor on which to sleep, but no furniture. Their meals fields are usually some distance from the place of abode, but their tobacco gardens are near their huts. Their main object in life seems to be to grow sufficient grain for food and beer. The grain they store in granaries, resembling small huts, placed on rocks or on stakes, out of the reach of white ants and secure from the depredations of animals. They amuse themselves occasionally by making earthware pots which are dull soft and easily broken, or by engaging in iron-work or brass-work for ornamentation. In the south they are quite clever in making water-tight baskets from rushes grown by the Sabi river. In their religious beliefs spirits play a great part. Above all there is a vague idea of a Supreme Being whom they call Mwari. They have a fixed belief in the spirits of their ancestors, the spirits of the witch-doctors, the spirits of the Matabele, the spirits of old women, the spirits of the foolish, the spirits of baboons, &c. Every occurrence is attributed to the influence of a spirit, and if the occurrence is an evil one a feast and dance of propitiation is held. Feasts of thanksgiving are also held on such occasions as the gathering of the first-fruits, the harvest festival, or on the return from a long and dangerous journey. Of the tribes already mentioned the most advanced are Umtasa's people and the Makaranga. The probable connexion of the tribes now inhabiting Mashonaland with the archæological structures of the ancient stone buildings which are scattered over the country is discussed in the section Archaeology. Of these ruins the most extensive are situated near Victoria and are known as Zimbabwe (q.v.).

In the western province the Matabele, or rather Amandabele, are the descendants of the Zulus who trekked under the
leadership of the famous Mosilikatze up through the Transvaal, whence they were driven by the Boers. Mosilikatze died in 1868, and his son Lobengula, after a fight with a brother, assumed sway in 1870. His kingdom was divided into three main sections: the Matsangai (who were the aristocrats), the Abenba and the Amaholi. The Amaholi or Holi were the cultivators of the land at the time of the invasion and thereafter were practically in the position of bondsmen and rarely allowed to possess cattle. The great spirit of the Holis was the Mlilo, who was practically the spirit of the nation. Among the Holi tribes are the Abashungwe, the Abanyal, the Batsone (near the Zambezi), the Abanzeni of the Wanki district, the Ababoro of the Tuli district, and the Abasili, a nomadic tribe chiefly subsisting on game. There is a small tribe in the Belingwe district called the Abalemba, which would appear to have been in touch with the Arabs in early times. Their customs include circumcision and the rejection of pork as food.

The natives in Southern Rhodesia number about 700,000, and of these 10,000 work on the mines and 20,000 are engaged in farming, railway and household work under Europeans.

Chief Towns.—Salisbury, which lies 4880 ft. above the sea, is the capital of Southern Rhodesia, being the seat of government and the site of Union Office (Mashealand). There are about 1700 white inhabitants and 3000 natives. It is the commercial centre for an extensive mining and farming district. The principal buildings include churches, public library, hospital, schools, churches, and large stores. The considerable number of government offices, and the administrator and resident commissioner live here. The only industries are a brewery and a tobacco factory for grading and packing the tobacco of the local growers.

Buwayo (g.v.), situated 4469 ft. above the sea, is the largest town and is in the western province, Matabeleland. It is 351 m. by rail S.W. of Salisbury, and 1362 m. N.E. of Cape Town. The population is some 4000. The town has a large and small gold mines; as well as one of the largest tobacco factories in the country. The advantage of a good pipe water supply and a service of electric light. It was the ancient capital of the Matabele king, Lobengula. There is a Government House which is occasionally occupied, and was the residence of Cecil Rhodes. It is from Buwayo that the World’s View, the burial-place of Rhodes in the Matoppo Hills, is usually visited.

The other towns are Umtali, on the eastern border, pop. 800 whites, railway works, centre for numerous large and small gold mines; Gwelo, the central town about midway between Salisbury and Buwayo, 370 whites; Victoria and Melsetter in the south, centres of farming districts. Victoria, near which are the famous Zimbabwe ruins, is reached by mail cart (80 m.) from Umtali and by motor car (30 m.) from Salisbury. There are also small townships at Hartley, Selukwe, Enkeloob and Gwanda. Buwayo and Salisbury are managed by town councils, the other towns have sanitary boards.

Communications.—The Rhodesian railway system connects the chief towns and mining centres with one another and all the other South African countries. The main line is a continuation of the railway from Cape Town through Kimberley and Mafeking. It runs from Mafeking in the general N.E. direction to Bulawayo and from there it goes along the Victoria Falls, which is crossed a little below the Victoria Falls. The bridging of the river was completed in April 1905. Thence the railway is continued N.E. to Kalomo, Barotseland, and onward to the central district of Bulawayo. The line from Bulawayo to Broken Hill (261 m.) was completed in 1907, and the extension to the frontier of Belgian Congo (265 m.) in 1909. This main line forms the southern link in the Cape to Cairo railway and steamboat service from Bulawayo to the Nile. From Bulawayo to N.E. of the rail runs through then S.E. to the Portuguese port of Beira. From Bulawayo another line (200 m. long) runs S.E. to the West Nicholson Mine. From Gwelo a railway (40 m.) goes S.E. to Yttenbode, and from there it branches (30 m. long) into the Ndola and Livingstone lines. From Bulawayo 268 m. runs N.W. to Lumogandi (84 m.). The last-named has a 2 ft. gauge. The other railways are of the standard gauge of South Africa—3 ft. 6 in. The distances from Bulawayo to the following places are: Bulawayo, 451 m.; Gwelo, 156 m.; Mafeking, 875 m.; Kimberley, 713 m.; Cape Town, 1362 m.; Port Elizabeth, 1199 m.; East London, 1260 m.; Bloemfontein, 800 m.; Johannesburg, 931 m.; Pretoria, 977 m.; Lourenco Marques, 1307 m.; Durban, 1238 m. (the last four places along the Quemba, Fourteen Streams, a junction 48 ft. N. of Kimberley) and Victoria Falls, 282 m.

About 4000 m. of roads have been built and are maintained by government. The telegraph and telephone systems are very complete, the latter being the police telephone wires and part of the African transcontinental system, and is served by about ninety telegraph offices. In Southern Rhodesia there are about eighty post offices. A post office savings bank was brought into operation on the 1st of January 1905. Over 2,500,000 letters, post-cards and parcels are despatched annually.

Agriculture.—The country is well adapted for agriculture. Chief attention has been paid by farmers to the growing of maize, the annual produce being about half a million bushels. It is a very easily grown cereal, and is raised on a large scale. Wheat is another crop which is extensively grown by natives, but the improved methods of the whites easily secure a yield of from twice to eight times that of the native. The average yield by European farmers is about eight bags of 200 lb per acre, but ten to fifteen bags per acre is quite a common result. Tobacco is grown in various places on the market, where they were easily disposed of. They are of better quality than those grown elsewhere in South Africa. In 1908 only, about 500 acres were under cultivation, but there are large tracts of land suitable for this industry.

Fruits of very extensive variety thrive in Rhodesia; they include plums, bananas, grapes, guavas, papaw, figs, loquats, pine-apples, Cape gooseberries, mulberries, tree tomatoes, rosellas, granadillas, and more than 80 kinds of cacti. The most flourishing are the citrus fruits, which are not surpassed in the South African and Japanese plums, but in the higher altitudes pears and apples are also very successful. Vegetables of nearly all kinds can be grown, especially potatoes, tomatoes, asparagus, sweet potatoes, yams, &c. Coffee produces as much as 4 lb of beans to the tree in certain districts.

Cattle thrive well in Rhodesia, and stock-raising promises to be the chief agricultural industry of the future. During the early period of European occupation rinderpest and at a later date East Coast fever threatened to reduce the herds of these animals to ruin; the disease is now thoroughly understood and, since the rinderpest of 1896 swept away large herds, cattle have been increasing rapidly in number. There is hardly any portion of the territory which is not suitable for cattle raising. The climate is such as to indicate an speedy prosperity in cattle ranching. Goats and woolless sheep number about 800,000 in the territory. Donkeys and mules thrive, but horses are very liable to horse-sickness towards the end of June and September.

Mining.—When Rhodesia was first opened up to European occupation, attention was immediately called to the large number of gold workings made by unknown former inhabitants of the country. The workings have been carried on to a limited extent, and the output of gold increased in value from £30,800 in 1900 to £2,623,000 in 1909; about one-third of this being produced by small workers whose individual output is not under 100 oz. A month. As efforts have been restricted mainly to extracting the ore indicated by ancient workings, it is probable that many gold reefs still await discovery. The mineral wealth of Rhodesia is very varied and includes silver, of which 262,000 oz. were produced in 1900: coal, 170,000 tons (1903), and lead, 965 tons. Extensive discoveries of chrome iron have been made in the Selukwe district. There is a steady export of this metal, of which the output in 1909 was over 25,000 tons. Besides these, small quantities of copper, wolframite and diamonds have been exported as scheelite and asbestos but these have done considerable to the export trade.

Commerce.—Taking the average for a series of years ending 1908, the total imports amounted to about £1,500,000 per annum, 55% of which were manufactured articles, including £950,000 in textiles and £200,000 in machinery. There was a steady increase in the amount of food and drink imported to £330,000. In 1909 the imports amounted to £2,214,000, the chief items being food and drink (£422,000), machinery, animals and cotton goods. Exports consisted mainly of articles destined for resale, the chief among these being tobacco (£3,178,000). Included in the total is £342,000 goods imported and re-exported.

Administration.—The administration of Rhodesia is carried on by the British South Africa Company under the order in council of 1858, amended by orders in council of 1903 and 1905. The company is called upon to appoint for Southern Rhodesia an administrator or administrators. The company also appoints an executive council of not fewer than four members to advise the administrator upon all matters of importance in administration. An order in council in 1903 provided for a
legislative council consisting of the administrator, who presides, seven nominees of the company approved by the secretary of state, and seven members elected by registered voters (the number of registered voters in 1898 was 59,931). In 1907 it was agreed to reduce the company's nominees by one, so that the elected members should form the majority of the council. The secretary of state appoints a resident commissioner, who sits on both executive and legislative councils without vote. The duty of the resident commissioner is to report to the high commissioner upon all matters of importance. Ordinances passed by the legislative council are submitted to the high commissioner for consent or otherwise, but may be disallowed by the secretary of state.

For the administration of justice there is a High Court with two judges having civil and criminal jurisdiction. There are seven magistrates' courts throughout the territory. For the administration of native affairs there are appointed a secretary for native affairs, two chief native commissioners, twenty-eight native commissioners and six assistant native commissioners. Natives suffer no disabilities or restrictions which do not equally apply to Europeans except in respect of the supply of arms, ammunition and liquor. Native commissioners may exercise jurisdiction in native affairs exceeding that exercisable by magistrates. The company has to provide land, usually termed Native Reserves, sufficient and suitable for occupation by natives and for their agricultural and industrial requirements.

Revenue.—The administrative revenue of Southern Rhodesia was at first much less than the cost of administration. For 1890-1891, it was £20,000; expenditure, £19,000. In 1895-6 (in which year the revenue exceeded £50,000), the cost of administration has been met out of revenue for the first time. The revenue now amounts to about £500,000. The two main items being customs duty, £190,000, and native tax, £200,000. The native tax is £1 per head for every adult male and 10s. for every wife after the first.

Education.—Besides a few private schools, there were in 1900 34 schools for Europeans, 26 of which were wholly financed by government, the remainder being aided. The aided schools are as a rule connected with some religious body, and aid is given to the extent of half the salaries of the teachers and half the cost of school requisites. Loans are also given to assist in school building. A system of boarding grants has been instituted to enable children in the outlying districts to attend school. Education is not free except to poor children, but the government has not exceeded 6d. a year. In 1910 several schools had reached the stage of preparing pupils for matriculation at the Cape University and similar examinations. The number of pupils in 1900 in European schools was 1,212, being more than double what it had been four years previously. The education of natives is in the hands of various religious bodies, but financial aid is given by government to native schools which comply with certain easy conditions. In 1909, 80 native schools with an enrolment of 7,722 pupils earned grants.

Military Forces.—The military force in Southern Rhodesia is styled the British South African Police, and numbers about 40 officers, 400 non-commissioned officers and men, and 350 native police. The force is under a commandant-general, who, with the ordinate officers, is appointed by the secretary of state, and is under the direct control and authority of the high commissioner. The commandant-general is paid by the British parliament. The officers and commandant-general and resident commissioner were combined in 1905.

The Southern Rhodesia Volunteers, in two divisions, eastern and western, under command of colonels, number altogether 86 officers and 2,000 non-commissioned officers and men.

Medical.—There are, including cottage hospitals, ten hospitals in towns and municipalities, and thirteen district hospitals have been established.

Archaeology.—Between the Zambezi and the Limpopo, and extending from the coast to at least 27° E., may be found the traces of a large population which inhabited Southern Rhodesia and Portuguese East Africa in bygone times. Apart from numerous mines, some of which are being successfully worked at the present day, ruins of stone buildings have been found in several hundred distinct places. Few of these have been explored systematically, but investigations in 1905, though confined to a small number of sites, determined at least the main questions of date and origin. The fanciful theories of popular writers, who had ascribed these buildings to a remote antiquity, and had even been so audacious as to identify their founders with the subjects of King Solomon or of his contemporary the queen of Sheba, are now seen to be untenable. J. T. Bent's Ruined Cities of Mashonaland (1892) is now interesting only for its illustrations, and his theories are obsolete. Positive archaeological evidence demonstrates that the "Great Zimbabwe" itself, the most famous and the most imposing of the misnamed "Ruined Cities," was not built before medieval times, and that the earliest date which can be assigned to any of the sites explored is subsequent to the 11th century A.D. Moreover, the complete identity of custom, revealed no less by the details of the dwellings than by the type of the articles found within them, proves that the tribe which built these structures was one closely akin to that not actually identical with the present Bantu inhabitants of the country.

These ruins, even when stripped of their false romance, are of extreme interest; but their nature and appearance have been much misunderstood, and the skill and intelligence required to construct them was far beyond that of the present African tribes. It should be clearly stated, therefore, that the methods of the old Rhodesians evince their complete ignorance of all the devices employed in the architecture of civilized peoples. They have not attempted to solve the problems of supporting weight and pressure by the use of pillar, arch or beam; the ingenuity of the builders goes no further than the dexterous heaping up of stones. Indeed, their most finished and elaborate work must be compared with nothing more ambitious than the dry-built walls which serve to enclose the fields in certain parts of England. The material is the local granite or diorite obtainable in the immediate neighbourhood. Stonework has not been practised; and was unnecessary, since the natural flaking of the boulders provides an abundance of ready-made slabs which need only be detached from the parent rock and broken to the required size. At most the blocks thus obtained have been very roughly trimmed with one or two blows, and any apparent regularity in the fitting has been obtained merely by judicious selection. Mortar has seldom been used; the courses are never laid with any apparent exactness, the blocks are merely abutted on one another, without being bonded, and the same line often varies greatly in thickness at different parts.

The main principle of the ground plan is invariably circular or elliptical, though it is carried out with a conspicuous lack of symmetry or exactness. Straight lines are unknown, and even accidental approximations to an angle are rare. This is eminently characteristic of the Bantu, whose huts are commonly built in circular form. Indeed, it is the round Bantu hut which has been the original model for even the finest of these stone constructions. The connexion between the two, however, goes beyond mere resemblance. The stone walls are always accompanied by huts; they are mere partitions or ring-fences enclosing and structurally inseparable from platforms of clay or cement on which stand the remains of precisely the same dwellings that the Makalanga make at the present day. Buildings such as those at Dhlo Dhlo, Nana-tali and Kamini in Matabeleland, or at Zimbabwe in southern Mashonaland, are merely fortified kraals; remarkable indeed as the work of an African people, but essentially native African in every detail, not excepting the very outward form.

The best-known ruin of the Rhodesian ruins are those situated in the more central and southern region. In the north-east, however, the remains are even more numerous, though the single units are less remarkable. Over the whole of Inyanga and the Mazoe region are distributed hill-forts, pit-dwellings and intrenchments which are more primitive in character though of the same generic type as those found farther south. The inhabitants of these northern districts were occupied more in agriculture than in gold-mining, and one of the most striking features of their settlements is the
irrigation system. There are no aqueducts such as Europeans or Arabs might have built, but water furrows have been carried on admirably calculated gradients for miles along the hill-sides. The amount of labour which has been expended on the great village of Inyanga and the Zumbez is astounding. On one site, the Nickerk Ruins, an area of fully 50 sq. m. is covered with uninterrupted lines of walls. It is an interesting question which may be solved by future explorers whether these settlements do not extend north of the Zumbez. In-breaches like those of the Nickerk Ruins have been reported from the south-east of Victoria Nyanza, and Major Powell Cotton has published a photograph from the Nandi country which exhibits a structure precisely similar to the hill forts of Inyanga. (See also ZIMBABWE; MONOMOTAPA.)

History.—There is evidence that from the 10th or 11th centuries onward the lands now forming Rhodesia were inhabited by Bantu-negroes who had made some progress in civilization and who traded with the Arab settlements at Sofala and elsewhere on the east coast (see Archaeology above). From the 13th century, if not earlier, until about the close of the 18th century, a considerable part of this area was ruled by a hereditary monarch known as the Monomotapa, whose zim babwe (capital) was, in the earlier part of the period indicated, in what is now Mashonaland. Some of the Monomotapas during the 16th and 17th centuries entered into political and commercial relations with the Portuguese (see Monomotapa and ZIMBABWE). The Monomotapa “empire” included many vassal states, and probably fell to pieces through intertribal fighting, which greatly reduced the number of inhabitants. In the early years of the 19th century the tribes appear to have lost all cohesion. The people were mainly agriculturists, but the working of the gold-mines, whence the Monomotapas had obtained much of their wealth, was not wholly abandoned.

The modern history of the country begins with its invasion by the Matabele, an offshoot of the Zulus. Mosilikatze, their first chief, was a warrior and leader who served under the Zulu despot Chaka. Being condemned to death by Chaka, Mosilikatze fled with a large division of the Zulu army. About 1817 he settled in territories north of the Vaal, not far from the site of Pretoria; and in 1836 a treaty of friendship was established into which he was induced by the governor of Cape Colony. In the same year a number of the “trek Boers” had crossed the Vaal river, and came in contact with the Matabele, who attacked and defeated them, capturing a large number of Boer cattle and sheep. In November 1837 the Boers felt themselves strong enough to assail Mosilikatze, and they drove him and his tribe north of the Limpopo, where they settled and occupied the country subsequently known as Matabeleland. In 1838 Mosilikatze died. Kuruman, son and recognized heir of the old chieftain, had disappeared years before, and though a Matabele who claimed to be the missing heir was brought from Natal he was not acknowledged by the leading indunas, who in January 1837 invested Lobengula, the next heir, with the chieftainship. Those Matabele who favoured the supposed Kuruman were defeated in one decisive battle, and thereafter Lobengula, whose kraal was at Bulawayo, reigned unchallenged. At this time the Matabele power extended north to the Zambesi, and eastward over the land occupied by the Mashona and other Makalanga tribes. North of the Zambesi the western districts were ruled by the Barotse (q.v.), whose eastern portion had been overrun by other tribes of Zulu-Xosa origin, among whom the Ageni were the most powerful. The explorations of David Livingstone, Thomas Baines (1822-1875), Karl Mauch, and other travellers, had made known to Europe the general character of the country and the existence of great mineral wealth. Lobenguila was approached by several “prospectors” for the grant of concessions; among them two Englishmen, Baines in 1871 and Sir John Swinburne in 1872, obtained cessions of mineral rights, but little effort was made to put them in force. In 1882 President Kruger, who was then bent on extending the boundaries of the Transvaal in every direction, endeavoured to make a treaty with Lobenguila, but without success. The Warren expedition of 1884 to Bechuanaland (q.v.), while it checked for a time the encroachments of the Transvaal Boers, and preserved to Great Britain the highway to the north through Bechuanaland, also served to encourage colonists to speculate as to the future of the interior. At this time, too, the struggle between the nations of western Europe for the unappropriated portions of Africa had begun, and while the Boers, foiled in Matabeleland, endeavoured to get a footing in Mashonaland, both Portuguese and Germans were anxious to secure for their countries as much of this region as they could. In 1887 a map was laid before the Portuguese cortes showing the territories in Africa claimed by Portugal. They stretched across the continent from sea to sea, and included almost the whole of what is now Rhodesia, as well as the British settlements on Lake Nyasa. To the claim of a transcontinental domain Portugal had succeeded in gaining the assent of Germany and France, though Germany, which had secured a footing in south-west Africa, still dreamed of extending her sway over Matabeleland. By the instructions of Lord Salisbury, then foreign secretary, the British representative at Brussels had to take up the question of the Portuguese claim that except on the seacoast and on portions of the Zambezi and Limpopo Rivers, it was not a sign of Portuguese authority or jurisdiction in the districts claimed by them, and that the British government could not recognize Portuguese sovereignty in territory not effectively occupied by her.

This protest, so far as southern Rhodesia is concerned, might have been ineffectual save for the foresight, energy and determination of Cecil Rhodes, who had been instrumental in saving Bechuanaland from the Boers, and who, as early as 1878 had conceived the idea of extending British influence over central Africa. At this time gold prospecting was being feverishly undertaken all over South Africa as a result of the discoveries at Barberton and on the Rand, and Lobengula was besieged for all sorts of concessions by both Portuguese and Boers, as well as by other adventurers from all parts of the world.

If the country was to be secured for British immediate action was necessary. Sir Sidney Shipppard, who had succeeded Rhodes as commissioner in Bechuanaland and who shared his views, kept up a friendly correspondence with Lobenguila, while a Bulawayo Mr J.S. Moffat was British official and, until the end of 1886, Sir Sidney urged the high commissioner, Lord Rosmead (then Sir Hercules Robinson), to allow him to conclude a treaty with Lobenguila, but unavailingly, until Rhodes, by taking upon himself all pecuniary responsibility, succeeded in obtaining the required sanction. On the 11th of February 1888, Moffat and Lobenguila signed an agreement, whereby the Matabele ruler agreed that he would refrain from entering into any correspondence or treaty with any foreign state or power without the previous knowledge and sanction of the British high commissioner for South Africa. Shortly after the conclusion of this treaty, representatives of influential syndicates directed by Rhodes, in which Alfred Beit and C. D. Rudd were large holders, were sent, with the knowledge of the British government and the high commissioner, to negotiate with Lobenguila, and on the 30th of October of the same year he concluded an arrangement with Messrs Rudd, Rochfort Maguire and F.R. Thomson, by which, in return for the payment of £100 a month, together with 1000 Martini-Henry rifles and 100,000 rounds of ammunition, he gave the syndicate complete control over all the metals and minerals in his kingdom, with power to exclude from his dominions “all persons seeking land, metals, minerals or mining rights therein.” In return for such concession, if necessary, he promised to render them assistance. The position of the envoy was one of considerable danger, as Lobenguila had around him many white advisers strongly antagonistic to

1 See article “Bechuanaland” by Sir Henry Shipppard in British Africa (London, 1899).
Rhodes's scheme. The arrival at Bulawayo of Dr L. S. Jameson, who had previously attended Lobengula professionally, and who strongly supported Rudd and his companions, appears to have been the factor which decided Lobengula to sign the concession. This concession once obtained, Rhodes proceeded with rapidity to prosecute his great enterprise. He extinguished the claims of earlier concessionaires by purchase (giving, for instance, £10,046 for the Baines and Swinburne grants), and united all interests in the British South Africa Company, with a share capital of £1,000,000.

Following the example of Sir George Goldie in West Africa and of Sir William Mackinnon in East Africa, Rhodes determined to apply to the British government for a charter for the newly formed company, whose original directors were, in addition to Rhodes and Beit, the duke of Abercorn, the duke of Fife, Lord Gifford, Albert (afterwards 4th earl) Grey and George Cawston. In applying for a charter (in April 1888) the founders of the company stated their objects to be the following: (1) To extend northwards the railway and telegraph systems in the direction of the Zambezi; (2) to encourage emigration and colonisation; (3) to promote trade and commerce; (4) to develop the natural resources and obviate the management of one powerful organization, thereby obviating conflicts and complications between the various interests that had been acquired within these regions, and securing to the native chiefs and their subjects the rights reserved to them under the several concessions. In making this application the boundaries in which they proposed to work were purposely left somewhat vague. They were described to be the region of South Africa lying immediately north of British Bechuanaland, north and west of the South African Republic, and west of the Portuguese dominions on the east coast. The government, having ascertained the substantial nature of the company's resources and the composition of the proposed directorate, and also that they were prepared to begin immediately the development of the country, granted the charter, dated the 29th of October 1888. From this date onward the company was commonly known as "the Chartered Company."

A few points in the charter itself are deserving of note. In the first place, it gave considerable extension to the terms of the original British concessions by Lobengula. In short, it transformed the rights of working minerals and metals, and preventing others from doing so, into rights practically sovereign over the regions in which the company's activity was to be employed. These rights the crown granted directly itself, not merely confirming a previous grant from another source. By Article X. the company was empowered to make ordinances (to be approved by the secretary of state), and to establish and maintain a force of police. A strict supervision was provided for, to be exercised by the secretary of state over the relations between the company and the natives. The British government reserved to itself entire power to repeal the charter at any time that it did not consider the company was fulfilling its obligations or endeavouring duly to carry out the objects for which the charter was granted.

The sphere of operations of the company was not stated with any greater precision than had been indicated in the application for the charter; but by agreements concluded with Germany in 1909, with Portugal in 1883, and with the Congo State in 1894, the international boundaries were at length defined (see Article 5). The agreements, while they took the British sphere north to Lake Tanganyika, disappointed Rhodes in that they prevented the realization of the scheme he had formed by the time the charter was granted, namely, for securing a continuous strip of British territory from the Cape to Egypt—a scheme which was but an enlargement of his original conception as formulated in 1878.

Much, however, had happened before the boundaries of the British sphere were fixed. While the railway from Cape Town was being continued northward as rapidly as possible, the determination was taken to occupy immediately part of the sphere assigned to the company, and Mashonaland was selected as not being in actual occupation by the Matabele but the home of more peaceful tribes. A pioneer force was sent up in June 1890 under Colonel Pennefather, consisting of five hundred mounted police and a few hundred pioneers. Accompanying this force as guide was the well-known traveller, F. C. Selous. The work of transport was attended with considerable difficulty, and roads had to be cut as the expedition advanced. Nevertheless, in a few months the expedition, without firing a shot, had reached the site of what is now the town of Salisbury, and had also established on the line of march small forts at Tuli, Victoria and Charter. Archibald Ross Colquhoun was chosen as the first administrator. He had not long been in office when, in May 1891, difficulties arose with the Portuguese on their north-west frontier, both parties claiming a tract of territory in which a Portuguese trading station had been established. The result was a skirmish, in which a small company of British South Africa police were victorious. In 1891 Dr Jameson, who had joined the pioneer force, was appointed administrator in succession to Colquhoun. The Boers for several years had been planning a settlement north of the Limpopo, and they now determined, in connection with the Mofu, to advance further into Mashonaland out of their object. An expedition known as the Banyuvalleek Trek was organized under the leadership of Colonel Ferreira, and two large parties of Boers proceeded to the banks of the Limpopo. Information of the intended trek had been conveyed to Cape Town, and Sir Henry (afterwards Lord) Loch (the high commissioner) at once sent a strong protest to President Kruger, informing him that any attempt to invade the Chartered Company's territories would be an act of hostility against the British Crown; and Kruger issued a proclamation forbidding the trekkers to proceed. Meanwhile, however, a party had already reached the Limpopo, where they were met by Jameson in command of the British South Africa Company's forces. He told them that they would not be allowed to proceed except as private individuals, who might obtain farms on application to the Chartered Company. Colonel Ferreira was arrested and detained for a few days, and the expedition then broke up and dispersed.

The pioneers, who were granted farms and mining claims, having been settled in Mashonaland, Rhodes recognized the extreme importance of giving the country a port nearer than that provided by Cape Town. On his initiative proposals were made to Portugal, and the treaty concluded in 1892 between Great Britain and Portugal provided that a railway might be built from Beira in Portuguese territory to Salisbury, on condition that Portugal received a duty not exceeding 3% on the value of the goods imported. The treaty further stipulated for the free navigation of the Zambezi and the construction of telegraphs. Prospecting operations were at once started, and various gold mines were discovered containing traces of old workings. Fresh gold reefs were also opened up. The prospects of the country seemed promising, and although a good deal of fever occurred in the low-lying valleys under the conditions of camp life, the health of the community soon improved as more suitable habitations were erected. In two years a white population of 3000 people had settled in the newly opened country.

Though the company was now free from international rivalry it was soon faced by serious native trouble. The first pioneers had deliberately chosen Mashonaland as their place of settlement. Ever since the advent of Mosilikatze north of the Limpopo the unfortunate Mashonas had been the prey of the Matabele; they therefore readily accepted the British occupation. The Matabele, however, were loth to abandon their predatory excursions among the Mashonas, and in July 1893 a large impis (native force) was sent into Mashonaland, and entered not only native kraals, but also the streets of the new township of Victoria. An attempt was made to preserve the peace, but it was evident from the attitude taken by the Matabele that nothing short of the authority which only superior force could command would settle the question. The Matabele were
A proud and fearless race of warriors; the men of that generation had never come in conflict with Europeans, and had never been defeated in their conflicts with native foes. Jameson’s forces were slender, and Rhodes, on being consulted, urged him by telegram to “Read Luke fourteen, thirty-one.” On obtaining a Bible, Jameson read the words: “Or what king, going to make war against another king, sitteth not down first, and consulteth whether he be able with ten thousand to meet him that cometh against him with twenty thousand?” He telegraphed in reply: “All right. I have read Luke fourteen, thirty-one.” The position, though dangerous, admitted of no delay, and Jameson determined to risk an expedition with the forces at his command. His success on this occasion doubtless weighed with him on another and less fortunate one. The force available consisted of about 700 volunteers and 225 British Bechuanaland police, with some 700 natives. Jameson determined to march to Bulawayo, the headquarters of Lobengula and the capital of Matabeleland. The force was divided into two columns, and was to be met by a further column of Bechuanas marching from the south under Khamo, the most influential of the Bechuana chiefs and a loyal friend of the British. The first engagement took place on the Shangani river, when the two columns which had started from Fort Charter and Fort Victoria were both engaged. Majors Forbes and Allan Wilson commanded in these engagements; and after a hot contest with between 4000 and 5000 Matabele, the latter were repulsed, machine guns being used with terrible effect upon the enemy. On the 1st of November a second fight occurred on the high ground, in which it was estimated that 7000 of the Matabele attacked the laager of the two columns. The oldest and most tried regiments of Lobengula dashed right up to the muzzles of the guns, but were swept down before the modern rifles and machine guns with which the invaders were armed. Meanwhile the column of Khamo’s men from the south had reached the Tati, and won a victory on the Singuezi river on the 2nd of November. On the 3rd of November Bulawayo was reached, and the columns from Mashonaland, accompanied by Jameson and Sir John Willoughby, entered the town, Lobengula, and his followers being in full flight towards the Zambesi. An endeavour was made to induce Lobengula to surrender, but as no replies were received to the messages, Major Forbes, on the 13th of November, organized a column and started in pursuit. The pursuing party were delayed by difficult roads and heavy rains, and did not come up with Lobengula until the 3rd of December. Major Allan Wilson, in command of thirty-four troopers, crossed the Shangani river in advance, and bivouacked close to Lobengula’s quarters. In the night the river rose, and reinforcements were unable to join him. During the early morning the Matabele surrounded the little band, and after fighting most gallantly to the last, Major Allan Wilson and all his followers, with the exception of three messengers, who had been sent back, were killed.

In January 1894 Lobengula died—from fever, or as the result of a wound, accounts differ—at a spot about forty miles south of the Zambezi. After his death his indunas submitted to the Chartered Company’s forces, and the war, which cost the company over one hundred lives and £110,000, was thus ended. Allan Wilson in council of the 18th of July following defined the administrative power of the company over Matabeleland. Charges were made against the company of having provoked the Matabele in order to bring on the war and thus secure their territory, but after inquiry the company was expressly exonerated from the charge by Lord Ripon, then colonial secretary. With the close of the war the Matabele appeared to be crushed, and for over two years there was no serious trouble with the natives. The country was at once thrown open to white settlers. Close to the site of Lobengula’s kraal the new town of Bulawayo was founded, and rapidly grew in importance. Among the new settlers were many Dutch farmers. The Roman-Dutch law was chosen as that of the new colony, a land commission was established and commissioners appointed to look after the interests of the natives.

Considerable development in the part of the company’s territory north of the Zambezi had meantime taken place. Between 1880 and 1881 a large number of tribes in the region between lakes Nyasa and Tanganyika and the Zambezi had entered into treaty relations with the company, and a settlement named Abercorn had been founded at the south end of Tanganyika. This work was undertaken in part to forestall German action, as before the signature of the agreement of July 1893 German agents entertained the design of penetrating west of Lake Nyasa to the Congo State frontier. The company further acquired the property of the African Lakes Company—which had done much to secure British predominance in the Nyasa region—and on the organization of Nyasaland as an imperial protectorate the South Africa Company contributed £15,000 a year for three years (1893–95) towards the costs of the administration, the imperial commissioner during this period acting as administrator for the adjacent territories belonging to the company (see BRITISH CENTRAL AFRICA). Farther west, Lewanika, the king of the Barotses, signed, on the 27th of June 1890, a treaty placing his country under the protection of the Chartered Company, which, while obtaining all mineral rights, undertook not to interfere in the internal administration of Barotseland. In securing a position thus early in Barotseland, Rhodes’s aim was to prevent the farther extension eastward of the Portuguese province of Angola. The subsequent development of Barotseland had little direct connexion with the events in other parts of Rhodesia (see BAROTSE and LEWANIKA). The growth of territory and the outlay on Matabeleland led to a great increase of expenditure, and the capital of the company was raised to £2,000,000 in November 1893, and to £2,500,000 in July 1895.

In every step taken by the company the guiding hand was that of Cecil Rhodes, a fact which received recognition when, by a proclamation of the 2nd of November 1895, his territory received officially the name of “Rhodesia.” During this year there was great activity in exploiting Matabeleland. “Stands” or plots were sold at extraordinary prices in Bulawayo; £50 fetched a total of £153,312, about £285 a stand. In within nine months Bulawayo had a population of 1900 whites, and in the various goldfields there were over 2000 prospectors. The construction of telegraphs proceeded with rapidity and by the end of 1895, 500 m. of new lines had been constructed, making about 1500 in all. A new company, the African Transcontinental Company, had been founded under the auspices of Rhodes, with the ultimate purpose of connecting the Cape with Cairo. By the end of 1895, 133 m. of these lines had been laid. At this time too, the railway from Cape Town had passed Mafeking and was approaching the Rhodesian frontier, while on the east coast the line to connect Salisbury with Beira was under construction.

In November 1895 the crown colony of British Bechuanaland was attached to Cape Colony, and the Chartered Company desired to take over the administration of the Bechuanaland protectorate, which stretched between the new company’s portion of Cape Colony and Matabeleland, and through which the railway to Bulawayo had to pass. The British government consented, and arrangements were made for the transfer. The company’s police were moved down to a camp in the protectorate at Pitsani Potlogi. It was from this place that on the 29th of December Jameson crossed the Transvaal border and marched on Johannesburg, in his disastrous attempt to upset President Kruger’s administration. The “Jameson Raid” put an end to the proposed transfer of the protectorate to the Chartered Company, and caused a serious crisis in its affairs. Rhodes resigned his position as managing director, and Alfred Beit.
retired from the directorate in London. Jameson was, on the 9th of January 1896, officially removed from his office of administrator of the company's territories, and was succeeded by Earl Grey. Just at this time rinderpest made its appearance in southern Rhodesia, carrying off large herds of cattle, and this was followed in March 1896 by a revolt of the Matabele, while in June the Mashona also rebelled. The occasion, but not the cause, of the Matabele rising was the withdrawal of the greater part of the company's force to take part in the Jameson Raid. The Matabele had various grievances, chiefly that after the war of 1893 they were treated as a conquered people. All able-bodied young men were required to work for the white farmers and miners a certain number of months per annum at a fixed rate of pay—a most irksome regulation, enforced, on occasions, by the native police in a tyrannical fashion. Another grievance was the seizure by the company, after the death of Lobengula, of the cattle of the Matabele as their chief source of wealth. Not only was there a first confiscation after the war, but subsequently there was a periodical taking away of cattle in small numbers—the company acting under the belief that nearly all the cattle in Matabeleland belonged to the king and were therefore lawfully theirs. However, before the end of 1893 the company had settled the question in agreement with the indunas, two-fifths of the cattle to go to the company and the remainder to become the absolute property of the natives. But it was neither the action of the company in the confiscation of cattle, nor the labour regulations, that induced the mass of the people to rebel; they were induced to act by chiefs who chafed under their loss of power and position and imagined themselves strong enough to throw off the yoke of the conquerors. In the manner customary among savages the Matabele began hostilities by the murder of defenceless white settlers—men, women and children. Bulawayo was threatened, and soon all the country south of the Zambezi was in a state of rebellion. Imperial troops under Sir Frederick Carrington were hurried up to the assistance of such police as the British South Africa Company still had at its command. Volunteers were enrolled, and much fierce fighting followed. Rhodes hastened to Bulawayo, and after conferences with the military and other authorities he determined to go, with Dr Hans Sauer and Mr J. Colenbrander, a well-known hunter and pioneer intimately acquainted with the natives, and interview the chiefs. They went (September 1896) unarmed into the heart of the Matopo Hills, and there arranged terms of peace with the indunas. The interview involved grave danger to the emissaries, and depended for its success entirely upon Rhodes's personality and influence over the native races, but it terminated what promised to be a long and disastrous native war. The Matabele, whose legitimate grievances were acknowledged and met, thereupon went home. The war after the indaba with Rhodes; the Mashona revolt continued, and was not finally crushed until October 1897, though all danger to settlers was over six months previously. At this time the rinderpest had carried off nearly all the cattle in the country—a disaster which, together with the destruction of grain during the war, had brought the natives almost to starvation—and steps had to be taken to supply their needs. Many of the white settlers too were reduced to sores straits and required assistance. The rebellions had cost the company fully £5,500,000, and to meet the debt incurred an additional capital of £1,500,000 was raised in 1898. At the meeting of the company in April 1898, at which this step was taken, Rhodes was re-elected a director.

The events of 1896—the Jameson Raid and the rebellions—caused the imperial government to re-examine the constitution of Rhodesia. The armed forces of the company had already been placed under the direct control of the crown, and on the 20th of October 1898 an order in council was passed providing for the future regulation of the country. An imperial resident commissioner was appointed, who was also to be ex officio a member of the executive and legislative councils; and there was to be a legislative council, consisting of five nominated and four elected members. The first meeting of the newly appointed council took place at Salisbury on the 15th of May 1899. Other changes, in the direction of giving more power to the non-official element, were made subsequently (see above, Administration).

While these political changes were being made the company and the settlers set to work to repair the losses by war and plague. In particular the policy of railway development was pushed forward, and in November 1897 the line from Cape Town reached Bulawayo. The Mashonaland railway connecting Salisbury with Beira was completed in May 1899. In the same year gold-mining on a considerable scale began, the output for the year being over 65,000 oz. In the early part of 1899 Rhodes visited London and Berin in furtherance of his schemes for the transcontinental telegraph extension from Cape Town to Cairo, and the transcontinental railway. The latter was to be raised at 3%, but was unsuccessful. He received, however, the support of various companies in Rhodesia, who amongst them subscribed £252,800 at 3% for the immediate extension of the railway for 150 miles; and in May he stated, at a meeting of the Chartered Company, that the Rhodes Railways Limited would raise another £3,000,000 at 4%, to be guaranteed by the Chartered Company. In this way he hoped that the remaining 1050 miles of railway from Bulawayo to the frontier of German East Africa might be constructed. In Berlin, Rhodes had an interview with the German Emperor, when arrangements were arrived at for the passage of telegraph lines over German territory, and also in certain contingencies for the continuation of the transcontinental railway through German East Africa.

In many respects the country recovered rapidly from the disasters of 1896, one of the most important measures taken being the compulsory inoculation for rinderpest, which finally stamped out the disease in 1898-99. By the last balance-sheet issued by the company previous to the outbreak of the Boer War it would appear that the revenue of Rhodesia for the year ending the 31st of March 1898 amounted to £260,516 net, of which amount the sale of land plots accounts for £63,628; stamps and licences, £96,658; and posts and telegraphs, £6,745; so that the machinery of civilised life was already in full activity where eight years previously the only white inhabitants had been a few missionaries, hunters and traders. The government buildings were estimated in March 1898 to be worth £165,072, and the assessed value of the town property at Bulawayo was £2,045,000 and that at Salisbury £750,000. (Both those towns had been granted municipal government in 1897.) Education was arranged under the supervision of government inspectors, and various religious communities were also encouraged. The country appeared indeed in 1899 to be starting on the road to industrial and agricultural prosperity, but an almost complete stop to progress resulted from the outbreak of the Boer War in October of that year. The company could point with satisfaction to the fact that Rhodesia contributed nearly 1500 men to the forces serving in the war, 12½% of the European population. Rhodesia itself was not subjected to invasion, but the withdrawal of so large a number of able-bodied men seriously interfered with the development of the country, the war not ending until June 1902. Throughout this period the natives, with few exceptions, remained peaceful and gave the administration no serious trouble.

Before the war ended, Cecil Rhodes, whose chief work during the period since the Raid had been the building up of the country which bore his name, was dead (26th of March, 1896). Alfred Beit, who had in 1898 refused to rejoin the directorate, now consented (June 1902) to return to the board of the Chartered Company, on which he remained until his death in July 1906. The loss of Rhodes's guiding mind and inspiring personality was, however, manifest, and among the Rhodesians there arose
RHODIUM

African colonies enjoyed lively interest in Southern Rhodesia. The territory, not possessing self-government, could not take part in the national conference which met at Durban in October 1908 on equal terms with delegates of the Cape, &c. It was, however, represented by three members, on the understanding that Rhodesia would not, for the time being at least, be included in any agreement which might be reached.

The convention resulted in the union (on the 31st of May 1910) under one government of the Cape, Transvaal, Natal and Orange River colonies. The position of Rhodesia with respect to the Union was set forth in the South Africa Act 1909. It provides that the king, with the advice of the Privy Council, may on addresses from the Houses of Parliament of the Union admit into the Union the territories administered by the British South Africa Company on such terms and conditions as to representation and otherwise in each case as are expressed in the addresses and approved by the king.

In Rhodesia itself at this time there was a widespread feeling that there was no urgency as to the territory joining the Union, and the opinion was held by many that a separate existence as a self-governing community would be preferable. A section of the settlers were content for the present to remain under the government of the Chartered Company.

RHODIUM [symbol Rh; atomic weight 102-9 (0=16)], in chemistry, a metallic chemical element found, associated with the other elements of the platinum group, in crude platinum ore, wherein it was discovered in 1803 by W. H. Wollaston (Phil. Trans., 1804, p. 419). It may be obtained from the crude platinum ore after treatment with aqua regia and removal of the products of chloroplatination. The mother liquors are decomposed by treatment with metallic iron; the precipitate obtained being washed with concentrated nitric acid and heated in an iron crucible with concentrated caustic potash. The residue thus obtained is mixed with salt and

1 Unless otherwise stated, the place of publication is London.

The metal is best obtained by the reduction of chloropurpure rhodium chloride, (CrRhH₂O)₃Cl₄, in a current of hydrogen, the metal after reduction being cooled in a stream of carbon dioxide (S. M. Jorgensen, *Zeit. anorg. Chem.*, 1903, 34, p. 83). It somewhat resembles aluminium in colour; its specific gravity varies from 11 to 12.1; and its specific heat is 0.05577 (V. H. Regnault, *Ann. chim. phys.*, 1861, 63, p. 15). It is less fusible than platinum. It oxidizes superficially when heated, and may be distilled in the electric furnace. It is insoluble in acids, but forms a soluble saltpetre when fused with potassium bisulphate (a reaction which distinguishes it from the metallic halides of the platinum group). It oxidizes when fused with hydrochloric acid to the dioxide, RhO₂. It absorbs hydrogen readily. Rhodium black is obtained by reducing rhodium salts with formic acid, by alcohol in the presence of alkali; or by precipitation with zinc and iron. A colloidal rhodium may be prepared by reducing the sesquisulphide with hydrazine hydrate. Rhodium salts may be recognized by their characteristic reaction with freshly prepared sodium hypochlorite solution. A yellow precipitate is obtained, which on shaking for some time with acetic acid gradually dissolves to an orange-coloured solution. This solution after a short time deposits a grey precipitate, and the supernatant liquid becomes azure blue in colour (E. Demarçay, *Comptes rendus*, 1885, 101, p. 953).

Several oxides of rhodium are known. The monoxide, Rho, formed when the hydrated sesquisulphide is heated (Claus) or when finely divided rhodium is heated in a current of air (Wilm), is a grey powder which is insoluble in acids. Rhodium oxide, Rho, a black insoluble powder, formed when the corresponding hydride is heated. This hydride, Rho(OH)₂, is obtained as a yellow powder, by decomposing rhodium salts (not the sulphate) with dilute solutions of ammonia in alcohol, or with water. It is soluble in acids, and in the moist condition is also soluble in concentrated acids. A hydrated rhodium dioxide, Rho₂(OH)₂, is formed when chlorine is passed into a solution of the sesquisulphide in concentrated caustic potash, or by heating a mixture of the alkyl chloride in a nitric acid solution of rhodium and sodium chloride. It is a greenish-black powder which is soluble in hydrochloric acid. Rhodium chloride, RhoCl₃, is obtained impure by heating the metal to dull redness in a current of chlorine, or, purer, by heating an alloy of rhodium and tin in chlorine and the dioxide of rhodium in chlorine at 440° C. (E. Leidé, *Ann. chim. phys.*, 1889, 129, p. 1249). It is a red powder, which decomposes at a red heat, leaving a residue of the metal. It is insoluble in water, and is soluble in alkaline solutions of potassium cyanide. The hydrated form, RhoCl₃·8H₂O, is obtained impure by dissolving the hydrated sesquisulphide in hydrochloric acid, by the action of hydrofluosilicic acid on potassium rhodium sesquisulphide, or by the action of concentrated nitric acid on rhodium in the presence of sodium chloride. In the last method the product is dissolved in a dilute hydrochloric acid (1:1), and the solution saturated with hydrochloric acid gas at 0° C., allowed to stand for some time, at 0° C., then carefully heated (Leidé). It forms a very dense, red, amorphous mass, which decomposes on exposure. It is very soluble in water, forming a yellow solution. It forms double salts with the alkaline chlorides.

Rhodium, Rho₂, formed when rhodium ammonium chloride are heated with sulphur, and also by precipitating rhodium salts with sulphuretted hydrogen, the precipitate being dissolved in ammonium sulphide and thrown down again by dilute sulphuric acid, is obtained in an alloy of rhodium and lead, or on the hydrated sesquisulphide. It is a red powder which decomposes when heated or when boiled with much water. It forms alums (Leidé, *Comptes rendus*, 1888, 107, p. 234). Rhodium potassium alum, Rh₂(SO₄)₃-K₂SO₄·2H₂O, is obtained by dissolving the sesquisulphide in sulphuric acid and adding two-thirds of the calculated amount of potassium sulphate to the solution (A. Pictet and L. Maneo, *Zeit. anorg. Chem.*, 1901, 27, p. 60). It crystallizes in cubes. Rhodium cyanide, Rh₂(CN)₆, is a carmine-red powder formed when rhodium potassium cyanide is boiled with acetic acid. Rhodium potassium cyanide, K₂Rho(CN)₆, is formed when the sesquisulphide is boiled with caustic potash and an excess of hydrocyanic acid added gradually, the solution being then evaporated in vacuo. It is a colourless crystalline solid soluble in water, and isomorphous with the corresponding iron, cobalt, chromium and manganese compounds.

The potassium ammonium salts correspond almost with the similar cobalt compounds and may be divided into three series—namely, hexammine salts (luto-salts), [Rh(NH₃)₆]X; aquo-pentammine salts (roseo-salts), [Rh(NH₃)₅H₂O]X; and pentammine salts (purpur eo-salts), [Rh(NH₃)₄(NH₂)CO]X. (See S. F. Jorgensen, C. W. Blomstrand, *Jour. prakt. Chem.*, 1882, et seq.)

The atomic weight of rhodium has been determined by S. F. Jorgensen (Jour. *prakt. Chem.*, 1883, 27, p. 446), by the analysis of chloro complexes, and is found to have a mean value obtained being 103; whilst K. Seubert and K. Koblick (Ann., 1890, 260, p. 314), by analysis of the double chloride and sulphate, obtained as a mean value 102.96.

**RHODOCHROSITE**—A mineral species consisting of manganese carbonate, MnCO₃, crystallizing in the rhombohedral or orthorhombic system. It usually occurs as a cleavable, compact or botryoidal masses, but in many instances being somewhat rare; these often have the form of the primitive rhombohedron, parallel to the faces of which there are perfect cleavages. When pure, the mineral contains 47.7% of manganese, but this is usually partly replaced by varying amounts of iron, and sometimes by calcium, magnesium, zinc, or rarely cobalt (cobalt-manganese-spar). With these variations in chemical composition the specific gravity varies from 3.45 to 3.60; the hardness is 4. The colour is usually rose-red, but may sometimes be grey to brown. The name rhodochrosite, from the Greek ῥόδος-χρος (rose-coloured), has reference to the characteristic colour of the mineral: manganese-spar and dialogite are synonyms. It is found in mineral veins with ores of silver, lead, copper, &c., or in deposits of manganese ore. Crystals have been met with in the mines at Kapnik-Bänya and Nagyag near Déva in Transylvania and at Diez in Nassau, but by far the best specimens are from Colorado. The mineral is used to a limited extent in the manufacture of spiegelers and ferromanganese.

**RHODODENDRON**. Common name for some 3,000 species of flowering plants, found in cool woodlands and Pliny, seem, from what can be ascertained, to have called the ecleander (Nerium Oleander) by this name, but in modern usage it is applied to a large genus of shrubs and trees belonging to the order of heaths (Ericaceae). No adequate distinction can be drawn between this genus and *Asclea* (q.v.); the proposed marks of distinction, however applicable in particular cases, breaking down when tested more generally. The rhododendrons are trees or shrubs, never herbs, with simple, evergreen or deciduous leaves, and flowers in terminal clusters surrounded in the bud by bud-scales but not as a rule by true leaves. The flowers are remarkable for the frequent absence or reduced condition of the calyx. The funnel- or bell-shaped corolla, on the other hand, with its five or more lobes, is usually conspicuous, and in some species so much so as to render these plants greatly prized in gardens. The flower stems are usually ten, with slender filaments and anthers opening by pores at the top. The ovary is five- or many-celled, the style is included in a body which splits from top to bottom by a number of valves, which breaks through the central placenta and liberates a large number of small bristle seeds provided with a membranous wing-like appendage at each end. The species are for the most part natives of the mountainous regions of the northern hemisphere, extending as far south as the Malay Archipelago and New Guinea, but not hitherto found in South America or Australia. None are natives of Britain. They vary greatly in stature, some of the alpine species being mere pygmies with minute leaves and tiny blossoms, while some of the Himalayan species are moderate-sized trees with superb flowers. Some are
epiphytal, growing on the branches of other trees, but not deriving their sustenance from them. The varieties grown in gardens are mostly grafted on the Pontic species (R. ponticum) and the Virginian R. catawbiense. The common Pontic variety is excellent for game-covert, from its hardiness, the shelter it affords, and the fact that hares and rabbits rarely eat it. Variety of colour has been induced by crossing or hybridizing the species first named, or their derivatives, with some of the more gorgeously coloured Himalayan-American varieties. In many instances this has been done without sacrifice of hardiness.

Some of the finest hybrids for the open air, especially in favoured spots, are alatenser (scarlet); Harrisii (rosy crimson); Kvenese (rose-purple), foofet (rose-pink); Mangrove (white); nodalumein (crimson), one of the first to flower after Christmas; praecox (rose-purple); and Shisloni (crimson). There are almost countless colour-variations of these, but one of the most exquisite of late years is that known as Pink Pearl, with large rose-pink blossoms of great purity. The foliage of rhododendrons contains much tannin, and has been used medicinally. Whether the honey mentioned by Xenophon as poisonous was really derived from plants of this genus as Allegro claims, is an open question.

Cultivation.—The evergreen kinds are readily propagated by seed, by layers, and by grafting. Grafting is resorted to only for the propagation of the rarer and more tender kinds. Loamy soil containing a large quantity of peat or vegetable humus is essential, the soil being well drained and devoid of alkali. The species require a sheltered situation, and a fungus partner (mycerus). An excess of lime or chalk in the soil proves fatal to rhododendrons and their allies sooner or later—a fact overlooked by many amateurs. The hardy deciduous kinds are very hardy and withstand cold-storage treatment well. The tender Malayan and Javanese species thrive in warm greenhouse temperature, but are difficult to cultivate where the winter is very alkaline.

RHODONITE, a member of the pyroxene group of minerals, consisting of manganese metasilicate, MnSiO₃, and crystallizing in the anorthic system. It commonly occurs as cleavable to compact masses with a rose-red colour; hence the name, from the Greek Rhos (a rose). Crystals often have a double habit; there are perfect cleavages parallel to the prism faces with an angle of 85° 31'5. The hardness is 5½-6½, and the specific gravity 3.4-3.68. The manganese is often partly replaced by iron and calcium, which may sometimes be present in considerable amounts; a greyish-brown variety containing as much as 20% of calcium oxide is called “bustamite”; “fowlerite” is a zinciferous variety containing 7% of zinc oxide. Rhodonite is a mineral liable to alteration, with the formation of manganese carbonate, hydrous silicate or oxides. The compact material, which is cut and polished for ornamental purposes, is often marked in a striking manner by veins and patches of these black alteration products. At Syedelnikova, near Ekaterinburg in the Urals, compact material of a good colour occurs in a clay-slate and is extensively quarried: boulders of similar material found at Cummington in Massachusetts (“cummingtons”) have also been worked as an ornamental stone. In the iron and manganese mines at Pajnbjg near Fibien in Vermland, Sweden, small, small, brilliant and translucent crystals (“paubergite”) and cavities mass occur. Fowlerite occurs as large, rough crystals, somewhat resembling pink felspar, with franklinite and zinc ores in granular limestone at Franklin Furnace in New Jersey.

RHOCESUS, a Samian sculptor of the 6th century B.C. He and his son Theodorus were especially noted for their work in bronze. Herodotus says that Rhocesus built the temple of Hera at Samos. In the temple of Artemis at Ephesus was a marble figure of night by Rhocesus. His name has been found on a fragment of a vase which he dedicated to Aphrodite at Naucratis. His sons Theodorus and Telecles made a statue of the Pythian Apollo for the Samians.

RHONDDA (formerly Ystradypodwgo), an urban district and parliamentary division of Glamorganshire, South Wales. It is 12 m. long by about 4 m. across at its widest part, and comprises two main valleys, named after their respective rivers, Rhondda Fawr (9 m.) and Rhondda Fach, or the lesser (6 m.), running S.E. and S.W. respectively till their junction at Pont, and thence the single valley or upland district, which is bounded by the Pontypidd urban district at Trehafod. The valleys are narrow and tortuous, and their lateral boundaries are formed by steep hills varying in height from about 500 ft. on either side of Trehafod to 1,340 ft. on the N.E. of Maerdy in the lesser Rhondda and 1,742 ft. on the S.W. of Treherbert in the main valley, while the mountains at the upper end of the latter valley culminate in Carn Mosen (1950 ft.). The two valleys are separated by the steep ridge of Cefn-rhondda, which ranges from 600 ft. high above Porth to 1,690 ft. near the upper end of the district. There are a few tributary valleys of which Cwmperw, Clydach Vale and Cymmer are the chief. Though the urban district measures 23,884 acres, the area built upon is generally a narrow strip on either side of each river except at Treorley and Ton, where the valley of the Rhondda Fawr opens out a little. In 1877 the ancient parish of Ystradyfodog (with the omission of the township of Rhigos, which lies beyond the mountains to the north) was formed into an urban district bearing the name “Rhondda”, the area having previously been part of a rural district under the Pontypidd rural sanitary authority. In October 1879, portions of the parishes of Llanwnono and Llanfair-Is-afan, comprising over 5,000 acres, were added to the urban area, the whole being consolidated in 1894 into one civil parish. In 1897, the name of the urban district was changed into Rhondda. The Taff Vale railway runs up each of the two valleys from a junction at Pont (16 m. N.W. of Cardiff), and has five stations in the main valley and four in the lesser one. From Porth it runs to Pontypidd, whence there is communication with Cardiff, Barry and Newport. The Rhondda and Swansea Bay railway (authorized in 1882, opened in 1890, and now worked by the Great Western) connects the upper end of the main valley, where it has a station, Blaen-rhondda, with Port Talbot, Neath and Swansea (31 m. distant) by means of a line which has a tunnel 3,445 yds. long.

The district occupies almost the centre of the eastern division of the South Wales coal-field, and its coal, upon which the inhabitants are almost entirely dependent, is unsurpassed for its steam-raising properties. In common with other East Glamorgan coal it became commercially known as Cardiff coal from the fact that Cardiff was at first its only port of shipment. The development of the Rhondda coal-field was later in date than those of Aberdare and Merthyr, and it received its chief impetus from the American Civil War. Thus the population of the parish (excluding Rhigos), which was 576 in 1811, 951 in 1851 and 3,935 in 1861, increased to 10,914 in 1871. When the boundaries of the district were extended in 1879 the population of the enlarged area was calculated by the registrar-general to be 23,930 in 1871, but it reached 55,532 in 1881, and 113,735 in 1901, showing an increase of 104% in the previous twenty years. In 1901, 35.4% of the population of three years of age and upwards spoke English only, 11.4% spoke Welsh only, the remainder being bilingual.

Ecclesiastically the parish of Ystradyfodog was an ancient parish dependent on Llaneron, the chief patron of which was the bishop of Llandaff and the church erected at Pontre (in substitution for which a new church was built) was in 1894-95 served the whole parish till the middle of the 19th century. Between 1879 and 1900 the ancient parish (excluding Rhigos) was divided into several parishes, the six new ones being Llwyn-y-pia (1879), Tylorstown (1887), Ysbyrhyd (1887), Treherbert (1893), Cwmparc (1898) and Ferndale (1900). The additional area brought into the urban district in 1879 comprises two other ecclesiastical parishes, Cymmer and Pont (1894), and Dinas and Penygroes (1901). The urban district area is 22 square miles; the Parliamentary district, have twenty churches and eighteen mission-rooms, with accommodation for about 12,000 persons. This area, together with Pontypidd, Glyncoch and Llanwnono, form the rural deanery of Rhigos, and the area of the larger parishes are shown in the map. There is at the end of 1905 over one hundred and fifty nonconformist chapels and mission rooms, with accommodation for over 85,000 persons, of which provision nearly two-thirds is in chapels with Welsh services. There is a Roman Catholic church at Tontandy. The public buildings include the council house and offices of the district council, erected in 1883-84 for the local board at Pontre, libraries and workmen's institutes at Ystrad (1898), and Cymmer
RHÔNE

(1893), Maerdy (1905), Dinas (1893), and Ferndale public halls, the property of a private company at Treherbert (1872), and Tonympandy (1891) and a county intermediate school at Pontypridd. By means of a tunnel about 2100 yds. long water is obtained for the main valley from the lake of Llyn Fawr on the N.W. side of the mountain range which shuts in the valley on the north. This lake has been converted into a storage reservoir of about 167 million gallons capacity. The rest of the district is supplied from the Pontypridd Water Company's works above Maerdy in the lesser valley.

The ancient parish (excluding Rhigos) was formed into a parliamentary constituency with one member in 1885. The present urban district substantially corresponds to the ancient territorial division of Glynn-Rhonddd, one of the four commotes of the cantred of Penychen, and subsequently, in Norman times, one of the twelve "members" of the lordship of Glamorgan. Its Welsh law was administered by the bishop of Llandaff, and it had its own courts, in which Welsh law was administered down to 1535, when the lordship was fully incorporated in the county of Glamorgan. On the ridge of Cefn-Rhonddd between the two valleys was the Franciscan monastery of Penrhys, famous for its image of the Virgin and for its holy well which attracted large pilgrimages. It was dissolved about 1415, probably owing to its having supported Glyndwr in his rebellion. Edward II. came here from Neath Abbey and was taken on the 16th of November 1326, either at Penrhys, or between it and Llantrisant.

(D. Ll. T.)

RHÔNE (Fr. Rhône, Lat. Rhodanus), one of the most important rivers in Europe, and the chief of those which flow directly into the Mediterranean. It rises at the upper or eastern extremity of the Rhône Alps, which separate the Savoyard Vaud from the great range of the Bernese Alps (N.) and the Leontine and Pennine Alps (S.) till it expands into the Lake of Geneva, winds round the southernmost spurs of the Jura range, receives at Lyons its principal tributary, the Saône, and then turns southward through France till, by many mouths, it enters that part of the Mediterranean which is rightly called the Golfe du Lion (sometimes wrongly the Gulf of Lyons). Its total length from source to sea is 504½ m. (of which the Lake of Geneva claims 45 m.), while its total drainage area in 37,798 sq. m., of which 2772 sq. m. are in Switzerland (405 sq. m. of the Swiss portion being composed of glaciers), and its total fall 3808 ft. Its course (excluding the Lake of Geneva, q.v.) naturally falls into three divisions: (1) from its source to the Lake of Geneva, (2) from Geneva to Lyons, and (3) from Lyons to the mouth.

1. From its source to the lake the Rhône is a purely Alpine river, flowing through the great trench which it has cut for itself between two of the loftiest Alpine ranges, and which (save a bit at its north-west end) forms the Canton of the Valais. Its length is 105¾ m., while its fall is 4679 ft. It issues as a torrent, at the height of 5900 ft., from the great Rhône glacier at the head of the Valais, the recent retreat of this glacier having proved that the river really flows from beneath it, and does not take its rise from the warm springs which are now at some distance from its shrunken snout. It is almost immediately joined on the left by the Matt torrent, coming from a small glacier to the S.E., and then flows S.W. for a short distance past the western approach to the Val d’Isère (whence it is known from this Grimsel and the Furka Passes upwards). But about half a mile from the glacier the river turns S.E. and descends through a wild gorge to the more level valley, bending again S.W. before reaching the first village, Oberwald. It preserves this south-westerly direction till Martigny. The uppermost valley of the Rhône is named Goms (Fr. Conches), its chief village being Münster, while Fiesch, lower down, is well known to most Swiss travellers. As the river rolls on, it is swollen by mountain torrents, descending from the glaciers on either side of its bed—so by the Geren (left), near Oberwald, by the Eginen (left), near Urichen, by the Fiesch (right), at Fiesch, by the Binna (left), near Gengiols, by the Bassa (right), flowing from the great Aletsch glaciers, above Brig. At Brig the Rhône has descended 3678 ft. from its height at the Jura, and now proceeds in an open, and is already a considerable stream when joined (left) by the Saltine, descending from the Simplon Pass. Its course below Brig is less rapid than before and lies through the alluvial deposits which it has brought down in the course of ages. The valley is wide and marshy, the river frequently overflowing its banks. Further mountain torrents (of greater volume than those higher up) fall into the Rhône as it rolls along in a south-westerly direction towards Martigny: the Visp (left), coming from the Zermatt valley, falls in at Visp, at Gamppel the Lonza (right), from the Lötschen valley, at Leuk the Dala (right), from the Gemmi Pass, at Siere the Navizen (left), from the Einisch or Anniviers valley, at Sion, the capital of the Valais, the Borgie (left) from the Val d’Hérens; soon the Rhône is joined by the Morges (right), flowing from the Sanetsch Pass, and the boundary in the middle ages between Episcopate Valais to the east and Savoyard Valais to the west, and at Martigny by the Dranse (left) before it impinges on the plains of the Great St. Bernard and the Val de Bagnes. At Martigny it is about 50 m. wide. The river bends sharply to the N.W., and runs in that direction to the Lake of Geneva. It receives the Salanfe (left), which forms the celebrated waterfall of Pissevache, before reaching the ancient town and abbey of St. Maurice (64 m.). Henceforward the right bank is in the canton of Vaud (conquered from Savoy in 1475) and the left bank in that of the Valais (conquered similarly in 1566), for St. Maurice marks the end of the historical Valais. Immediately below that town the Rhône rushes through a great natural gateway, a narrow and striking defile (now strongly fortified), which commands the entrance of the Valais. Beyond, the river enters the wide alluvial plain, formerly occupied by the south-eastern arm of the Lake of Geneva, and flows now marshy and running for miles. Finally it receives at Bex the Avançon (right), flowing from the glaciers of the Diablerets range, at Monthey the Villéze (left), from Champéry and the Val d’Illiez, and at Aigle the Grande Eau (right), from the valley of Ormonts-dessus. It passes by the hamlet of Port Valais, once on the shore of the lake, before expanding into the Lake of Geneva, between Villeneuve (right) and St. Gingolph (left). During all this portion of its course the Rhône is not navigable, but a railway line runs along it from Brier in about 72 m. to either Villeneuve or Le Bouveret.

2. On issuing at Geneva from the lake the waters of the Rhône are very limpid and blue, as it has left all its impurities in the great settling vat of the lake, so that Byron might well speak of the "blue rushing of the arrowy Rhone" (Childe Harold), and also that basin of 164 sq. m. (excluding the great Rhône gorge, which receives at Bex the Avançon), which is filled with the water of the Glôf du Lion, the mountains surrounding it being washed by the Rhône. The limpidity is disturbed by the pouring in of the turbid torrent of the Arve (left), descending from the glaciers of the Mont Blanc range, the two currents for some distance refusing to mix. The distance from Geneva to Lyons by the tortuous course of the Rhône is about 124 m., the fall being only about 689 ft. The characteristic feature of this portion of the course of the Rhône is the number of narrow gorges or cluses through which it rushes, while it is forced by the southern spur of the Jura to run in a southerly direction, till, after rounding the base of that spur, it can flow freely westwards to Lyons. About 12 m. S. of Geneva the Rhône enters French territory, and henceforth till Lyons forms first the eastern, then the southern boundary of the French department of Ain, dividing it from those of Rhône and Savoy. At Châtillon, it receives the Anniviers, and after it becomes French the river rushes furiously through a deep gorge, being imprisoned on the north by the Crédos and on the south by the Vuche, while the great fortress of l’Ecluse guards this entrance into France. The railway pierces the Crédos by a tunnel. In the narrowest portion of this gorge, not far from Bellegarde at its lower end, there formerly existed the famous Porte du Rhône (described by Saussure in his Voyages dans les Alpes, chapter xvii.), where for a certain distance the river disappeared in a subterranean channel; but this natural phenomenon has been destroyed, partly by blasting, and partly by the diversion of the water for the use of the factories of Bellegarde. At Bellegarde the Valseire flows in (right), and then the river resumes its southerly direction, from which the great gorge had deflected it for a while. Some way below Bellegarde, between Le Parc and Pyrimont, the
Rhône becomes officially "navigable," though as far as Lyons the navigation now consists all but wholly of the floating of flat-bottomed boats, named riages, laden chiefly with stone quarried from the banks of the river. Above Seyssel (11 m. from Bellegarde) the Usses (left) joins the Rhône, while just below that of the Fier (left) flows in from the Lake of Annecy. Below the junction of the Fier the hills sink on either side, the channel of the river widens, and one may say that it leaves the mountains for the plains. At Culos (413 m. by rail from Geneva) the railway from Geneva to Lyons (105 m.) quits the Rhône in order to run west by a direct route past Ambérieu. The Rhône continues to roll on southwards, but no longer (as no doubt it did in ancient days) enters the Lac du Bourget, of which it receives the waters through a canal, and then leaves it on the east in order to run along the foot of the last spur of the Jura. It flows past Yenne (left) and beneath the picturesque fortress (formerly a Carthusian monastery) of Pierre Châtel (right) before it attains the foot of the extreme southern spur of the Jura, at a height of 506 ft., not far from the village of Cordon, and just where the Guiers flows in (left) from the mountains of the Grande Chartreuse. This is nearly the last of the chasses through which the river has to make its way, and it is a pity that the Porte de la Chartreuse was not left to S. of Lagnieu. The river now widens, but the neighboring country is much exposed to inundations. It receives (right) its most important tributary in this part of its course, the Ain, which descends from the French slope of the Jura and is navigable for about 60 m. above its junction with the Rhône. Farther down the Rhône meanders for a time with shifting channels in a bed about 2 m. broad, but it gathers into a single stream before its junction with the Saône, just below Lyons. The Saône (q.v.), which has received (left) the Doubs, is the real continuation of the Rhône, both from a geographical and a commercial point of view, and it is by means of canals branching off from the course of the Saône that the Rhône communicates with the basins of the Loire, the Seine, the Rhône and the Moselle. In fact, up to Lyons, the Rhône (save when it expands into the Lake of Geneva) is a huge and very unruly mountain torrent rather than a great European river.

3. Below Lyons, however, the Rhône becomes one of the great riparian rivers of France. It was up its valley that first Greek, then Latin civilization penetrated from the Mediterranean to Lyons, as well as in the 10th century the Saracen bandits from their settlement at La Garde Freinet, near the coast of Provence. Then, too, from Lyons downstream, the Rhône serves as a great medium of commerce by which central France sends its products to the sea. Its length from Lyons to the sea is some 230 m., though its fall is but 530 ft. But during this half of its course it can boast of having on its left bank (the right bank is very poor in this respect) such historical cities as Vienne, Valence, Avignon, Tarascon and Arles, while it receives (left) the Isère, the Drôme and the Durance rivers, all formed by the union of many streams, and bringing down the waters that flow from the lofty snowy Dauphiné Alps. The Ardèche is the only considerable affluent from the right. Near Arles, about 25 m. from the sea, and by rail 17534 m. from Lyons, the river breaks up into its two main branches, the Grand Rhône running S.E. and the Petit Rhône S.W.; they enclose between them the huge delta of the Camargue, which is cut off by the banks of the river only, but elsewhere is simply a great alluvial plain, deposited in the course of ages by the river, and now composed of scanty pastureages and of great salt marshes. Between Lyons and the sea, the Rhône divides four departments on its right bank (Rhône, Loire, Ardèche and Gard) from as many on its left bank (Isère, Drôme, Vaucluse and Bouches du Rhône).

**RHÔNE**, a department of south-eastern France, formed in 1793 from the eastern portion of the department of Rhône-et-Loire, and comprising the old districts of Beaujolais, Lyonnais, Franc-Lyonnais, Forez and a small portion of Dauphiné. Pop. (1906) 858,097. Area, 1104 sq. m. Rhône is bounded N. by the department of Saône-et-Loire, E. by Ain and Isère and S. and W. by Loire. The Saône and the Rhône form its natural boundary on the east. The department belongs almost entirely to the basin of the Rhône, to which it sends its waters by the Saône and its tributary the Azerques, and by the Gier. The mountains which cover the surface of the department constitute the watershed between the Rhône and the Loire, and from north to south form four successive groups—the Beaujolais Mountains, the highest peak of which is 3320 ft.; the Tarare group; the Lyonnaïs Mountains (nearly 3000 ft.); and Mont Pilat, the highest peak of which belongs to the department of Loire. The lowest point of the department (460 ft. above sea-level) is at the egress of the Rhône. The meteorological conditions vary greatly with the elevation and exposure. Snow sometimes lies in the mountains from November to April, while at Lyons and in the valleys the mean temperature in winter is 36° F. and in summer 70°, the annual mean being 53°. The average rainfall is somewhat higher than is general over France owing to the amount of the precipitation on the hilly region.

Good agricultural land is found in the valleys of the Saône and Rhône, and for the most part the soil is stony and only moderately fertile. The Saône Valley is extensively cultivated, but their importance is less than that of the vine, the hills of the Beaujolais on the right bank of the Saône producing excellent wines. Fruit trees, such as peaches, apricots, walnuts and chestnuts, grow well, but the wood in general is little more than copse and brushwood. Good pasture is found in the valleys of the Azerques and its affluents. Mines of iron-pyrites and coal and quarries of freestone are worked. The production of silk fabrics, the chief branch of manufacture, that of chemicals and machinery, together with most of the other industries of the department, are concentrated in Lyons (q.v.) and its vicinity. Tarare is a centre for the manufacture of muslin and embroidery. Oullins has large railway workshops belonging to the Paris-Lyon-Méditerranée railway, and there are important glass works at Givors. Cotton-spinning and weaving are carried on in several localities. The products of its manufactures, together with wine and brandy, form the bulk of the exports of the department; its imports comprise mainly raw material for its industries. It is served by the Paris-Lyon-Méditerranée railway, the Rhône and Ardeche, and in the extreme south the canal of Givors is its navigable waterways. Lyons the capital is the seat of an archbishop and of a court of appeal and centre of an educational division (académie). The department is divided amongst the districts of the VIIth., VIIIth., XIIth., XIIIth. and XIVth. army corps. There are two arrondissements (Lyons and Villefranche) subdivided into 29 cantons and 269 communes. The principal places besides Lyons are Givors, Tarare and Villefranche, which receive separate treatment.

**RHÖN** or **DIE RHÔN**, a mountain-chain of central Germany, running in a north-westerly direction from the Bavarian province of Lower Franconia to the Prussian province of Hesse-Nassau and the grand duchy of Saxe-Weimar, and divided by the Werra from the Thuringian Forest on the N. The other sides are bounded by the Fulda on the W. and the Sinn and Frankish Saab on the E. and S. Its length is 50 m., breadth 5-7 m., and its mean elevation 1900 ft. This district is divided into three groups—the southern, the high (Hohe) and the northern (Vorland). Of these it is clear that a continuation of the Spessart, largely consists of flat conical masses and reaches its highest point in the Heiliger Kreuzberg (2900 ft.). The Hohe Rhôn, beginning immediately to the north-west of the latter mountain, is a high plateau of red sandstone, covered with fens and basalt peaks. It is a wild, dreary, inclement tract of country, covered with snow for six months in the year and visited by frequent fogs and storms. It is said of it that whoever desires to experience a northern winter can spare himself a journey to the North Cape or Siberia, and find it in his native Rhôn. There is little vegetation, and the inhabitants eke out a scanty sustenance from the cultivation of potatoes.
and flax. The highest inhabited place is Frankenstein, lying at a height of 2350 ft. with 6383 inhabitants (1000). The nearer (Vordere) Rhön, forming the northern side of the range, is more attractive, with forests and deep and fertile valleys.

See Lenk, Zur geologischen Kenntnis der südlichen Rhön (Würzburg, 1887); Scheidweiler, Die Rhön und ihre wirtschaftlichen Verhältnisse (Frankfort, 1887); and Daniel, Deutschland (5th ed., Leipzig, 1878).

RHOLANLI, a Sarmatian tribe defeated in the Crimea by Diophantus, general of Mithradates, c. 100 B.C., and by the Romans on the lower Danube c. A.D. 60, and also under M. Aurelius. They seem to have finally succumbed to the Goths.

RHUBARB. This name is applied both to a drug and to a vegetable.

1. The drug has been used in medicine from very early times, being described in the Chinese herbal Pen-king, which is believed to date from 2700 B.C. The name seems to be a corruption of Rheum darbaram or Reu darbaram, a designation applied to the drug as early as the middle of the 6th century, and apparently identical with the pior or pio of Dioscorides, described by him as a root brought from beyond the Bosphorus. In the 4th century rhubarb appears to have found its way to Europe by way of the Indus and Persian Gulf to the Red Sea and Alexandria, and was therefore described as "East Indian" rhubarb. Some also came by way of Persia and the Caspian to Syria and Asia Minor, and reached Europe from the ports of Aleppo and Smyrna, and became known as "Turkey" rhubarb. Subsequently, by the year 1563, when China first permitted Russia to trade on her frontiers, Chinese rhubarb reached Europe chiefly by way of Moscow; and in the 17th century the trade became a monopoly of the Russian government, in consequence of which the term "Russian" or "crown" rhubarb came to be applied to it. Urga was the great depot for the rhubarb trade in 1719, but in 1728 the depot was transferred to Kachak. All rhubarb brought to the depot passed through the hands of the government inspector; hence Russian rhubarb was invariably good and obtained a remarkably high price. This supervision naturally led, as soon as the northern Chinese ports were opened to European trade, to a new outlet being sought; and the increased demand for the drug at these ports resulted in less care being exercised by the Chinese in the collection and curing of the root, so that the rhubarb of good quality offered at Kachak rapidly dwindled in quantity, and after 1860 Russian rhubarb ceased to appear in European commerce. Owing to the expense of carrying the drug across the intervening 3000 miles of Asia, and the frequent attacks of insects, the drug was sometimes damaged from the attacks of insects. Rhubarb was formerly one of the most costly of drugs. In 1542 it was sold in France for ten times the price of cinnamon and four times that of saffron, and in an English price list bearing date of 1657 it is quoted at 16s. per lb, opium being at that time only 6s. and scammony 12s. per lb.

The dose of rhubarb is anything from 3 to 30 grains, according to the action which is desired. The British Pharmacopoeia contains several preparations, on which rhubarb is the principal ingredient, and the following are the quantities of rhubarb used: 1. Astringent tonics such as this is the Pulvis Rhei Compositus, or Gregory's powder, which is composed of 2 parts of rhubarb, 6 of heavy or light magnesia and 1 of ginger. The dose is 20 to 60 gr. Rhubarb is used in small doses as a depurative and as a cathartic, being a strong diuretic and possesses a very astringent action. It is also useful in coughs, diarrheas and fits. Rhubarb possesses a stimulating action on the liver and is also a secretory cholagogue, increasing the amount of bile formed by the liver. The drug is apt to cause colic, and should therefore never be given alone. The ginger in Gregory's powder averts this unpleasant effect.

2. The rhubarb is also often subjected to a special process of purification, by which the drug is made to pass through a more characteristic action of rhubarb, however. This process is peculiar in that the Rhude purified is subjected to a definite constipation, said to be due to the rhoeatonic acid. This explanation is hardly satisfactory, however, since it is difficult to see how the rhoeatonic acid can be retained in the bowel during the process of purification. Rhubarb has, therefore, definite indications and contra-indications. It is obviously worse than useless in the treatment of chronic constipation, which it only aggravates. On the other hand, it is very valuable in children and others, when diarrhoea has been caused by an unsuitable diet. The drug is of particular service in cases of fever caused by the food poisoning, and in the bowel rest. Rhubarb is also useful in the treatment of infants, since it is partly excreted in the maternal milk, and gives it a bitter taste which the baby dislikes.

Rhubarbins is also absorbed and is excreted in the urine, which it slightly increases and colours a reddish brown. The colour is discharged by the addition of a little dilute hydrochloric acid to the urine.

In the botanical source of Chinese rhubarb cannot be said to have been as yet definitely cleared up by actual identification of plants observed to be used for the purpose. Rheum palmatum, R. officinale, R. palmatum var. tanguticum, R. colchicarium and R. Ranaebochi are variously considered as sources of rhubarb roots. The roots are produced by these species under cultivation in Europe do not present the characteristic network of white veins exhibited by the best specimens of the Chinese drug.

The most important constituent of this drug, giving it its purgative properties and its yellow colour, is rhoeasarinin, C_{6}H_{10}O, formerly known as rhoea or chrysophanol. The rhubarb of commerce also contains chrysophanic acid, a dioxymethyl anthraquinone, C_{6}H_{10}O, which is a reduction product of rhoeasarinin, and also a dioxymethyl anthraquinone, which gives it the characteristic bitterness. There is also present a rosetanic acid, which is of some practical importance. There are numerous other constituents, such as saponin, C_{6}H_{10}O, mucilage, resorcinol, indole, amines, etc., which occur in the drug.

Production and Commerce.—Rhubarb is produced in the four northern provinces of China proper (Chi-hli, Shan-shan, Shen-shan and Ho-nan), in the north-west provinces of Kan-shan, formerly included in Sinkiang, and in the southern provinces of Chekiang, Ford, and Kiangsu, which are the new producing centres of the trade are Sining-fu in the province of Kan-shan, and Kwanhsien in Sze-chuenn. From Shen-shan, Kan-shan and Sze-chuan the rhubarb is forwarded to Hankow, and thence carried to Shanghai, whence it is shipped to Europe. Quantities are also exported to the United States of America from Canton, Amoy, Fuh-chow and Ning-po.

Very little is known concerning the mode of preparing the drug for the market. According to Mr Bell, who on a journey from St Petersburg to Peking in 1872, found in a growing state, the root is not considered to be mature until it is six years old. It is then dug up, usually in the autumn, and deprived of its cortical portion and smaller branches, and the larger pieces are divided in half longitudinally; these pieces are bored with holes and strung up on cords to dry, in some cases being previously subjected to a preliminary drying on stove shelves heated by fire underneath. In Bhutan the root is said to be hung up in a kind of shed, in which it is kept for a time but dried. The effect produced by the two drying processes is very different: when dried by artificial heat, the exterior of the pieces becomes hardened before the interior has entirely lost its moisture, and the drug is said to be of poorer quality. The interior of the Ptychancea, however, may show no change. These two varieties are technically known as kila-dried and sun-dried; and it was on account of this difference in quality that the Russian officer at Kachak had every piece examined by boring a hole to its centre.

European Rhubarb.—As early as 1608 Prosper Alpinus of Padua cultivated the true rhubarb a plant which is now known as Rheum rhaponticum, a native of southern Siberia and the basin of the Yenisey. This plant was introduced into England by Sir Matthew Lister, physician to Charles I., who gave seed obtained by him in Italy to the botanist Parkinson. The culture of this rhubarb for the sake of the root was commenced in 1777 at Banbury, Oxfordshire, by the blacksmiths, who were planting being raised from seed sent from Russia in 1762, and with such success that the Society of Arts awarded him a silver medal in 1789 and a gold one in 1794. The cultivation subsequently extended to Somersetshire, Yorkshire, and Middlesex, but is now chiefly carried on at Banbury. European rhubarb is sold at a cheaper rate than the Chinese rhubarb, and forms a considerable article of export to America, and is said to be used in Britain in the form of confectionery. The majority of it is grown in Yorkshire, which is a better yellow than the better yellow of Chinese rhubarb. The Banbury rhubarb appears to be a hybrid between Rheum palmatum and R. undulatum—the root, according to E. Colin, not presenting the typical microscopic structure of the former. More recently very

According to Mr F. Newcombe, Med. Pres. and Circ., Aug. 2, 1900, the Chinese Ch'u-shan rhubarb as before coming from Kanchow being the most prized of all; Sze-chuan rhubarb has a rougher surface and little flavour, and brings only about half the price; Ch'ung-chi rhubarb also is greatly valued. Although Schisandra, Ta-tz'hung, Tai-huang and Shan-huang varieties are considered worthless.
RHYL—RHYME

good rhubarb has been grown at Banbury from Rheum officinale, but these two varieties are not equal in medicinal strength to the Chinese article, yielding less extract—Chinese rhubarb affording, according to H. Seiler, 58%, English rhubarb 21% and R. officinale 17%. In France the cultivation of rhubarb was commenced in the latter half of the 18th century—R. compactum, R. palmatum, R. rhaponticum and R. undulatum being the species grown. The cultivation has, however, now nearly ceased, small quantities only being prepared at Avignon and a few other localities.

The culture of Rheum compactum was begun in Moravia in the beginning of the present century by Prikil, an apothecary in Austerlitz, and until about fifty years ago the root was largely exported to Lyons and Milan, where it was used for dying like

As a medicine 5 parts are stated to be equal to 4 of Chinese rhubarb. Rhubarb root is also grown at Auspitz in Moravia and at Ilmitz, Kremnitz and Frauenkirchen in Hungary; R. emodi is said to be cultivated for the same purpose in Silesia. Rhubarb is also prepared for use in medicine from wild species in the Himalayas and Java.

2. The rhubarb used as a vegetable consists of the leaf stalks of R. rhaponticum and its varieties, and R. undulatum. It is known in America as pie-plant. Plants are readily raised from seed, but strong plants can be obtained in a much shorter time by dividing the roots. Divisions or seedlings are planted about 3 ft. apart in ground which has been deeply trenched and manured, the crowns being kept slightly above the surface.

Rhubarb grows freely under fruit-trees, but succeeds best in an open situation in rich, rather light soil. The stalks should not be pulled during the first season. If a top-dressing of manure be given each winter a plantation will last good for several years. Forced rhubarb is much esteemed in winter and early spring, and forms a remunerative crop. Forcing under glass or in a mushroom house is most satisfactory, but open-ground forcing may be effected by placing pots or boxes over the roots and burying in a good depth of stable litter and leaves. Several other species, such as R. palmatum, R. obtusifolium and R. rhaponticum, have rootstocks cultivated for their fine foliage and handsome inflorescence, especially in wild gardens, margins of shrubbery and similar places. They succeed in most soils, but prefer a rich soil of good depth. They are propagated by seeds or by division.

RHYL, a watering-place and urban district of Flint, N. Wales, practically equidistant by rail from Bangor (29½ m.) and Chester (30 m.), and 209 m. from London on the London & North-Western railway. Pop. (1901) 8,473. It is situated near the mouth of the Clwyd. Formerly, like Llandudno, a small fishing village, the town has now all the appointments of a popular resort. In winter the gales often fill the streets to the depth of several feet, with drifts of sand from the surrounding dunes, which, however, are noted in summer for the dry and bracing air. The neighbouring country is interesting from its scenery and antiquities. Amongst the institutions of the town may be mentioned the Queen Alexandra Hospital (1902), and several hydrophatic establishments and convalescent homes. The estuary harbours coastering vessels, and some shipbuilding is carried on. On the beach towards Prestatyn can be seen the remains of a submerged forest.

RHYME, more correctly spelt RIME, from a Provençal word rim (its customary English spelling is due to a confusion with rhythmic), a literary ornament or device consisting of an identity of sound in the terminal syllables of two or more words. In the art of versification it signifies the repetition of a sound at the end of two or more lines in a single composition. This artifice was practically unknown to the ancients, and, when it occurs, or seems to occur, in the works of classic Greek and Latin poets, it must be considered to be accidental. The natural tendency of the writer of verse unconsciously to repeat a sound, however, is shown by the fact that there have been discovered nearly one thousand lines in the writings of Virgil where the final syllable rhymes with a central one, thus—

Bella per Emathios plus quam civilia campos.

It is more than doubtful, however, whether the difference of stress would not prevent this from sounding as a rhyme in an antique ear, and the phenomenon results more from the contingencies of grammar than from intention on the part of the poet. Conscious rhyme belongs to the early medieval period of monkish literature, and the name given to lines with an intentional rhyme in the middle is Leonic verse, the invention being attributed to a probably apocryphal monk Leuninus or Leonius, who is supposed to be the author of a history of the Old Testament preserved in the Bibliothèque Nationale of Paris. This "history" is composed in Latin verses, all of which rhyme in the centre. Another very famous poem in Leonic rhyme is the "De Contemptu Mundi" of Bernard of Cluny, which was printed at Bremen in 1595. Rhyme exists to satisfy the ear by the richness of repeated sound. In the beginnings of modern verse, alliteration, a repetition of a consonant, satisfied the listener. A further ornament was discovered when assonance, a repetition of the vowel-sounds, was invented. Finally, both of these were combined to procure a full identity of sound in the entire syllable, and rhyme took its place in prose. When this identity of sound occurs in the last syllable of a verse it is the typical end-rhyme of modern European poetry.

Recent criticism has been inclined to look upon the African church-Latin of the age of the Mozarabes as a starting-point for modern rhyme, and it is probable that the language of primitive Moor-shippers in hearing and singing long pieces of Latin verse in the ritual of the Catholic church produced the earliest conscious poems in rhyme. Moreover, not to give too great importance to the Leonic hexameters which have been mentioned above, it is certain that by the 4th century a school of rhymed sacred poetry had come into existence, classical examples of which we still possess in the "Stabat Mater" and the "Dies Irae." In the course of the middle ages, alliteration, assonance and end-rhyme held the field without a rival in vernacular poetry.

There is no such thing, it may broadly be said, as medieval verse in which one or other of these distinguishing ornaments is not employed. After the 14th century, in the north of Europe, and indeed everywhere except in Spain, where assonance held a powerful position, end-rhyme became universal and formed a distinctive indication of metrical construction.

It was not until the invention of Blank Verse (q.v.) that rhyme found a modern rival, and in spite of the successes of this new rhymeless form, when all events foreordained by rhymeless form, in the principal literatures of Europe, certain forms of poetry are almost inconceivable without rhyme. For instance, efforts have been made to compose rhymeless sonnets, but the result has been, either that the piece of blank verse produced is not in any sense a sonnet, or else that some artifice the appearance of rhyme has been retained. In the heyday of Elizabethan literature a serious attempt was made in England to reject rhyme altogether, and to return to the quantitative measures of the ancients. The prime mover in this heresy was not a poet at all, but a pedantic grammarian of Cambridge, Gabriel Harvey (1547—1639). He considered himself a great innovator, and for a short time he actually seduced no less melodious a poet than Edmund Spenser to abandon rhyme and adopt a system of accented hexameters and trimeters. Spenser even wrote largely in those measures, but the greater portion of his experiments in this kind, of which The Dying Pelican is supposed to have been one, have disappeared. From 1576 to 1579 the genius of Spenser seems to have been obscured by this error of taste, but he shook it off by the device. The Hymn to Charity. Harvey considered Richard Stonyhurst (1547—1618) the most loyal of his disciples, and this author published in 1582 four books of the Aeneid translated into rhymeless hexameters on Harvey's plan. The result remains, a portent of ugliness and cacophony. A far greater poet, Thomas Campion (1575—1620), returned to the attack, and in a tract published in 1602 advocated the remission of rhyme from lyrical poetry. He, by dint of a prodigious effort, produced some unrhymed odes which were not without charm, but the best critics of the time, such as Daniel, repudiated the innovation, and rhyme continued to have no serious rival except blank verse.
in its upper part the valley, like others adjacent and parallel to it, is populous with mining townships, and the town of Rhymney owes its growth not only to these two factors, rising coal-mines and to its iron and steel works, which employ nearly the whole population. The works of the Rhymney Iron Company, including blast furnaces and rolling mills, are among the largest of the kind in England.

RHYLITE (Gr. ῥέω, to flow, because of the frequency with which they exhibit fluxion structures), the group name of a type of volcanic rock, occurring mostly as lava flows, and characterized by a highly acid composition. They are the most siliceous of all lavas, and, with the exception of the dacites, are the only lavas which contain free primary quartz. In chemical composition they very closely resemble the granites which are the corresponding rocks of plutonic or deep-seated origin; their minerals also present many points of similarity to those of granite though they are by no means entirely the same. Quartz, orthoclase and plagioclase felspars, and biotite are the commonest ingredients of both rocks, but the quartz of rhyolites is full of glass enclosures and the potash felspar is pellicid sandine, while the quartz of granite contains dust-like fluid cavities of very minute size, and its potash felspar is the turbid variety which is properly called orthoclase. The granites also are holocrystalline, while in the rhyolites there are usually porphyritic crystals floating in a fine ground-mass. Rhyolites have also been called liperites because many of the lavas of the Lipari Islands are excellent examples of this group. Above all rocks they have a disposition to assume vitreous forms, as when fused they crystallize with great difficulty. Hence it has long baffled experimenters to produce rhyolite synthetically by fusion; it is stated that these difficulties have now been overcome, but geologists believe that the presence of steam and other gases in the natural state expedites crystallization. In crucibles these cannot be retained at the temperatures employed; when the rocks are melted the gases escape and on cooling a pure glass is formed. The vitreous forms of rhyolite are known as obsidian, perlite and pumice (qq.v.).

The minerals of the first generation, or phenocrysts, of rhyolite are mainly orthoclase, oligoclase, quartz, biotite, augite or hornblende. The felspars are usually glassy clear, small but of well-developed crystalline form: the potash felspar is pellicid sandine, usually Carlsbad twinned; the soda-lime felspar is almost always oligoclase, with characteristic pseudo-prothetetic structure. Both of these may be corroded and irregular, but the augite and biotite twinning then distinguish them readily from quartz. Glass enclosures, sometimes rectangular with small immobile bubbles, are frequent. The quartz occurs as blebs or sub-rounded grains, which are corroded doubly, and occasionally are many and nearly always rounded or elliptical in section. No proper cleavage is seen in the quartz, though arcuate (conchoidal) fractures may often be noticed; they may have been produced by strain on cooling. Phenocrysts of micropegmatite are known in some rhyolites; they may have the shape of felspar or of quartz crystals; in the former cases Carlsbad twinning is by no means uncommon, but in other cases hour-glass structure is very conspicuous. Biotite is often a deep brown or greenish brown, in small hexagonal tablets, generally blackened at their edges by magmatic corrosion. Muscovite is not known in rhyolites. Hornblende may be green or brown; in the quartz-pantellerites it sometimes takes the form of strongly pleochroic brown corundum. Like biotite it is suprarenal but often corroded in a marked degree. Augite, which is equally common or more common than the other fero-magnesian minerals, is always green; its crystals are small and perfectly shaped, and commonly the same phenomena are very rarely seen in it. Zircon, apatite and magnetite are always present in rhyolites, their crystals being often beautifully perfect though never large. Olivine is never a normal ingredient, but occurs in the hollow spherulites or lithophy-phyllites, which are composed of small grains of similar, but often more or less affected, minerals which indicate pneumatolytic action. Among the less common accesory minerals of the rhyolites are cordierite in crystals which resemble hexagonal prisms but break up under polarized light into rhombohedral twinning; these weather to green aggregates of chlorite and muscovite (pintle); garnet, sphene and orthite may also be met with in rhyolites.

The ground-mass of rhyolitic rocks is of three distinct types which are stages in crystalline development, viz. the vitreous, the felsitic or cryptocrystalline, and the microcrystalline. Hence some authorities have proposed to subdivide the group...
into the *spherophyres*, the *felsophyres* and the *granophyres*, but this is not now in use, and the last of these terms has obtained a significance quite different from that originally assigned to it. Mixtures of the different kinds occur; thus a vitreous rhyolite has often felsitic areas in its ground-mass, and in the same lava flow some parts may be vitreous while others are felsitic. The vitreous rhyolites are identical in most respects with the obsidians, from which they can only be separated in an artificial classification; and in the glassy base the banded or eutaxitic, spherulitic and perlitic structures of pure obsidians are very frequently present (see OBSIDIAN; PETRITE). The felsiliparites or liparites with stony ground-mass are especially common among the pre-Tertiary igneous rocks (see QUARTZ-PORPHYRY), as liparite glass is unstable and experiences devitrification in course of time. Many of these felsites have fusion banding, spherulites and even perlitic cracks, which are strong evidence that they were originally glassy. In other cases a hyaloliparite, obsidian, or pitchstone becomes felsitic along its borders and joint planes, or even along perlitic cracks, and we may assume that the once fibrous rock has changed into felsite under the action of temperature or moisture, or even by atmospheric decomposition. In many rhyolites the felsite is original and represents an incipient crystallization of the vitreous material which took place before the rock was yet cold. The felsite in turn is liable to change; it becomes a fine mosaic of quartz and alkali felspar; and in this way a matrix of the third type, the microcrystalline, may develop. This is proved by the occurrence of the remains of spherulitic and perlitic structures in rocks which are no longer felsitic or glassy. Many microcrystalline rhyolites have a ground-mass in which much felsitic matter occurs; but as this tends to recrystallize in course of time, the older rocks of this group show least of it. Whilst no quartz-bearing rhyolites are known to have been erupted in recent years, Lacroix proved that portions of the “dome” which rose as a great tower or column out of the crater of Mont Peleé after the eruption in 1906 contained small crystals of quartz in the ground-mass. The rock was an acid andesite, and it was ascribed by Lacroix to the action of steam retained in the rock under considerable pressure. The microcrystalline ground-mass of rhyolites is never micrographic as in the porphyries (granophyres); on the other hand it is often micropoikilitic, consisting of small felspars, often sub-rectangular, embedded in little rounded or irregular plates of quartz.

The ground-mass of rhyolites is liable to other changes, of which the most important are silicification, kaolinization and sericitization. Among the older rocks of this group it is the exception to find that secondary quartz has not been deposited in some parts of them. Often indeed the matrix is completely replaced by silica in the form of finely crystalline quartz or chalcedony; and these rocks on analysis prove to contain over 90% of silica. In the recent rhyolites of Hungary, New Zealand, &c., the deposit of coarse opal in portions of the rock is a very common phenomenon.

Kaolinization may be due to weathering, and the stony dull appearance of the matrix of many microcrystalline rhyolites is a consequence of the decomposed state of the felspar grains in them; it is even more typically developed by fumarole action, which replaces the felspars with soft, cloudy white products which belong to a mineral of the kaolin group. Sericitization, or the development of fine white mica after felspar, is usually associated with shearing, and is commonest in the older rhyolites.

Vesicular structure is very common in rhyolites; in fact the pumiceous obsidians have this character in greater perfection than any other rocks (see PUMICE); but even the felsi-rhyolites are very often vesicular. The cavities are usually lined with opal and tridymite; in the older rocks they may be filled with agate and chalcedony. The "millstone porphyries," extensively used in Germany for grinding corn, are porous rhyolites; the abundance of quartz makes them hard, and their rough surfaces render them peculiarly suitable for this purpose. In some of them the cavities are partly secondary. These rocks are obtained in the Odenwald, Thuringerwald and Fichtelgebirge.

In Britain, a notable pre-Tertiary rhyolite occurs at Tardree, Antrim (the only British rock containing tridymite), and in Skye. Felsitic rhyolites occur among the Old Red rocks of Scotland (Pentland Hills, Lorne, &c.), in Devonshire, and in large numbers in North Wales. The Carnarvonshire rhyolites are often much altered and silicified; some of them are said to have been composed of quartz and felspar. A few rhyolites of Britain (pre-Cambrian, Uriconian) is the spherulitic rhyolite of the Lea Rock near Wellington in Shropshire. It shows bright red spherulites in great numbers and is probably an obsidian composition developed by the alteration of a perlitic structure (see PERLITE).

In other parts of Europe rhyolites have a fairly wide distribution though they are not very numerous. In Hungary (Hiinitk, &c.) there are many well-known examples of this class. They extend from the Carpathians to the Iberian peninsula and across the Pyrenees into Spain. In Italy they occur in the Euganean Hills and in the Lipari Islands; the latter being the principal source of pumice at the present day. Rhyolites of Recent age occur in Iceland (Myvatn, &c.), where they are observed in the occurrence of quartz and the presence of much plagioclase and pyroxene. Some of these rocks have been called trachy-obsidians, but they do not appear to be rhyolites which contain an exceptionally large quantity of alkali. Their olivine and alkali felspars are coarser than those of rhyolites in Germany, are mostly of Permian or Carboniferous age and are numerous in the Voges, Odenwald, Thuringerwald, &c. They are often accompanied by basic rocks (melaphyres). Permian rhyolites which are very fine and contain no olivine are known as granites in Asia Minor and the Caucasus, in New Zealand, Colorado, Nevada and other parts of western North America. In the Yellowstone National Park there is a well-known cliff of obsidian which shows Helena, clear, perfect globules. Some of the rhyolites of Nevada are exceedingly rich in porphyric members and may appear at first sight to be holocrystalline rocks, since the ground-mass is scanty and inconspicuous. To this type the name nevadite has been given, because of their peculiar texture and distribution.

In the island of Pantelleria, which lies in the southern part of Sicily, there are rocks of rhyolitic affinities which present so many unusual features that they have been designated pantellaretes. They contain less silica and alkali and more micas and iron than the ordinary rhyolites. Their felspar varies from microperthite to the very fine felspar, being rich in soda together with potash, and are variable in crystalline development. Aegirine-augite and forms of soda-alkali feldspar are also characteristic of these rocks: dark brown aegirine or aegirin feldspar is often found in these rocks, and are infrequent in them, and are very plentiful; other ingredients are olivine, arvedsonite and tridymite.

The ground-mass varies much, being sometimes quite vitreous, at other times a glass filled with swarms of microoliths, while in certain localities it shows a microcrystalline aggregate of quartz, alkali felspar, and alkali felspar. The absence of plagioclase and biotite are marked distinctions between these rocks and the rhyolites, together with the scarcity of quartz and the prevalence of soda-bearing pyroxene and amphibole.

Among the Palaeozoic volcanic rocks of Germany there is a group of lavas, the quartz-keratophyre, which are of acid composition and rich in alkali felspar. Their dominant alkali is soda: hence their felspars are all the Carpathian or soda felspar, and no one in rhyolites. Quartz occurs sometimes as corroded phenocrysts, but is often scarce even in the ground-mass. Porphyritic biotite or augite are very rare, but occur in the matrix along with felspars and quartz, and the MICROLITE is not infrequent in these rocks, and they may be silicified like the rhyolites. As quartz-keratophyres mostly occur in districts where there has been a good deal of folding, they are often crushed and more or less sericitized. They are best known from the Tweed valley of the upper Tweed, and the Tweed valley of the lower Tweed, but are also found in Queensland, and similar rocks have been described (as soda-felsites) from Ireland. The rocks which they accompany are usually diabases and splitites.

In the belts of Virginia and Maryland the alkali felspar and soda pyroxenes and amphiboles are the comendites. They are often porphyritic, with crystals of quartz, sanidine, microperthite or albite; the ground-mass is microcrystalline or rarely microlithic, and usually filled with these minerals. They are known from the recent eruptive districts of East Africa, from Sardinia and Texas, and very similar rocks occur as intrusive masses which may be grouped with the porphyries.

The following table gives the composition of some of the principal types of rocks:

SiO₂: Silicon dioxide; Al₂O₃: Aluminium trioxide; Fe₂O₃: Ferric oxide; FeO: Iron oxide; CaO: Calcium oxide; MgO: Magnesium oxide; K₂O: Potassium oxide; Na₂O: Sodium oxide; H₂O: Water.
We note in the rhythmologies I—III. the very high silica, with alkalis and aluminum also in considerable amount, while lime, magnesia and iron are very low. In the pantellerite, keratophyre and comendite the silica tends to be less abundant, while the alkalis, especially soda, increase; they have less alumina but are richer in iron and magnesia. It is easy to see why the latter types contain less quartz, feldspars often very rich in soda, and femic minerals which contain iron and alkalis in notable amounts such as aegirine, riebeckite and arvedsonite.

**RHYTHM** (Greek πνεύμα, from πέπω, “to flow”), the measured flow of movement, or beat, in verse, music or by analogy in other conceptions, e.g. “rhythm of life.” The early critical use of prosody, Aristoxenus, distinguished as the three elements out of which rhythm is composed, the spoken word, λέξις, the tune of music and song, μέλος, and the bodily motion, κινήσις σωματική. The art of the early Greek poets was devoted to a harmonious combination of these three elements, language, instrument and gesture uniting to form perfect rhythm. Aristoxenus proceeds to define the rhythm so produced as an arrangement of time-periods, τέχνη χρόνων, but other early theorists make not the time but the syllable the measurement of poetic speech. Both music and poetry depend, and have depended from the earliest times, on rhythm. But in music melody and harmony are to be taken in consideration, whereas in poetry the rhythmical value of the tone is modified by the imaginative value and importance of the words themselves. In earliest times the fundamental unity of the two arts was constantly manifest, but as the world has progressed, and they have ramified into countless forms, the difference between them has been emphasized more and more.

**Rhythm in Verse**.—Professor Jakob Minor has added a figure, valuable in helping us to realize what poetic rhythm is, when he remarks that to strike a bell twelve times, at exactly equal intervals, is to produce what may be called, indeed, a rhythmic effect, but not to awaken anything resembling the sensation of poetical rhythm. Into the idea of poetic rhythm enters an element of life, of pulse, of a certain inequality of time based upon an equality of tone. Rhythm ceases to be poetic rhythm if it is mechanical or lifeless. Aristotle, from whom a definition might be expected, is very vague in dealing with the subject, and most of the old rhetorical writers talk of rhythm with statements that are obscure or irrational. The fact is that rhythm is an expression of the instinct for order in sound which naturally governs the human ear, and little practical knowledge is gained by following Suidas when he says that rhythm is the father of metre, or Quintillian in his epigram that rhythm is male and metre is female. These definitions arise from the rhetorical desire to measure a delicate instinct by rule of three, and, as a matter of fact, Greek criticism on this subject often lost itself in arithmetical absurdities. It is sufficient to say that rhythm is the law which governs the even and periodical progress of sounds, in harmony with the exigencies of human emotion. For the passions, as expressed in verse, various movements are appropriate. Joy demands that the voice should leap and sing; sorrow that it should move solemnly and slowly; and poetry, which is founded on rhythm, requires that the movement of words should respond to this instinctive gradation of sounds. The finer the genius of the metrist the more exquisitely does his rhythm convey, as upon an instrument, the nature of the passion which burdens his verses. Ecstasy takes a quick, eager, rising movement:—

"Give him the nectar! Pour out for the poet, Hebe, pour free! Quicken his eyes with celestial dew, That Styx the detested no more he may view."

**Mystery and suspense demand a faint, languid and throbbing movement:**—

"There is not wind enough in the air To move away the ringlet curl From the lovely lady's cheek— There is not wind enough to twirl The outer leaf of the last of elan, Which dances as often as dance it can."

An overpowering sadness interprets itself in rhythm that is full and slow and emphatic:—

"My genial spirits fail, And what can these avail To lift the smothering weight from off my breast? It were a vain endeavor, Though I should gaze for ever On that green light that lingers in the west: I may not hope from outward forms to win The passion and the life, whose fountains are within."

The rhythm so produced, intimately linked, almost beyond the dissociating power of analysis, with human feeling, may depend either on accentuation or quantity. The latter forms the principle upon which all classic metre was composed, while the former is dominant in nearly every description of modern verse. Greek and Latin verse depends entirely upon the relation of syllables, long or short. It was a question of time with the ancients, of stress or weight with us. It is an error to say, as is often done, that ancient verse did not recognize accent, and that in modern verse there is no place for quantity. These statements are generally true, but there are various exceptions to both rules. Schipper, in his *Englische Metrik*, specially points out that "long and short syllables have no constant length, no constant relation, but they depend on their place in the verse, and on the context; though they do not determine the rhythm of verse, they still act as regulators of our metre in a very important degree." *Pauses* take an essential importance in the construction of modern rhythm, of the variety and vitality of which they are the basis. They are introduced for the purpose of relieving the monotony of successive equal groups of syllables. The pause often takes the place of a light syllable, and there are instances in the verse of Shakespeare and Milton where it is even allowed to fill up the space of a heavy syllable. But still more often the pause does not imply the dropping of a syllable at all, but simply dictates a break in the sound, equivalent to a break in the sense. The following extract from a "Psalm" in Creasah's *Steps to the Temple* (1646), in which the pauses are numerous and energetic, will exemplify the variety of this artifice:—

"On the proud banks of great Euphrates' flood, | There we sat; and there we wept: Our harps | that now no music understood, | Nodding on the willows slept | While unhappy captiv'd we | Lovely Sion | thought on thee."

In the blank verse of Milton the free use of pauses constitutes the principal element in the amazing metrical art of the poet, and is the source of the sublime originality of his music. In speaking of rhythm, it is customary to think of the formal rules which govern the fixed cadence of feet in poetry, but there is also a rhythm in prose, which imitates the measured movements of the verse. In an essay on the rhythm of the ancient poetry of the Hebrews it is said that on this prose movement, which differs, in fact, from that of modern European poetry merely in its undefined and indeterminate character. See J. Minor, *Neuköckhende Deutsche Metrik* (Strassburg, 1893); W. Christ, *Die Metrik der Greichen* (Leipzig, 1874; Roderick Benadix, *Das Wesen des deutschen Rhythmus* (Leipzig, 1862); Jakob Schipper, *Englische Metrik* (Leipzig, 1895); Edwin Guest *History of English Rhythms* (London, 1818; 2nd ed., 1882); Théodore de Banville, *Petit Traité de la poésie française* (Paris, 1881); F. B. Gummere, *Handbook of Poetics* (Boston, 1902).

**Rhythm in Music**.—The rhythm of modern music began to develop through the attempts of learned medieval musicians to adapt the rhythms of spoken language to the necessities of choral singing; but before the process had gone far, certain much more ancient and powerful principles, always manifest in folk-song and dance, gained ascendency, so that even the
simplest classical music has a rhythm for which no criteria of poetic metre can be made adequate. From the musical point of view, the rhythm of speech, whether in prose or verse, is very subtle and almost uniform in quality. The metrical feet which constitute the patterns of poetic rhythm are musically very minute; and the exaggerated forms in which music represents them are many and varied. On the other hand, the groups of metrical feet which constitute any one kind of verse are of a uniformity which for music on a large scale would be intolerable. Artistic music is soon compelled to draw upon infinite resources of its own, which preserve an appropriate accentuation of the sense and feeling, while obliterating or hugely exaggerating the poet's rhythmic effects. Musical rhythm cannot be studied on a sound basis unless its radical divergences from speech-rhythm are recognized from the outset.

In the earliest extant musical settings of poetry the treatment of accent and quantity was strictly arithmetical; and purely aesthetic requirements were satisfied by ex post facto inference from the arithmetical laws, rather than treated as the basis of the laws. Accent, when translated into music, is a rhythmic sensation resembling the stress we put on the left foot in marching; while quantity rarely suggests any bodily movement at all, since it can correspond only to variations in the length of steps. Now in modern music a sense akin to that of bodily movement is of overwhelming importance. Changes of *tempo*, and of the grouping of musical beats, are incidents as obvious in their effect as changes in the pace of a running horse. One consequence is that the laws of musical accent are simple and cogent, while the laws of musical quantity, if such exist, are far beyond our reach. Fluent speech and energetic physical exercise cannot be carried on simultaneously by the same person; and hence the laws of quantity belong to speech rather than to dance. Before we could form adequate notions of the musical rhythms of classical Greece, we should need to settle, firstly, how far the dancing in Greek drama included movements other than idealized dramatic gesticulation; secondly, how much bodily energy was involved in all dancing that may have gone beyond this; and lastly, how much dancing of any kind was executed by the singers while singing. What is certain is that ancient Greek musical rhythms were exact translations of verse rhythms, with the quantities interpreted arithmetically.

The extant fragments of Greek music are, whether we have read them correctly or not, undoubtably very different in rhythm from the system of disent pian which European music of the 12th and 13th centuries first developed; but they resemble disent pian in so far as the modern sense of rhythm is absent and its place is supplied by a sense of the rhythmic expression of unusually slow and emphatic speech. In ordinary speech there is an important difference between long syllables and short; but it is not naturally regulated by an exact rhythm, and the art by which it is organized in verse admits (or indeed demands) considerable freedom on the part of the reciter in varying his pace within such limits as do not destroy the structure of the lines. But when a chorus is made to sing words, it must, if the words are to reach the hearer, sing them slowly; and moreover, it must sing them exactly together, unless, as in much classical music, it can repeat them until they are either understood or dismissed from the mind as a mere pretext for the employment of voices in a merely musical design. In any case, if a chorus is to sing well together, the contrast between short and long syllables must be placed on an arithmetical basis, the simpler the better. Now the sole function of ancient Greek music was to enhance the emotional effect of poetic words by regulating their rise and fall in a musical scale and their length in a metrical scheme; and it was natural and right that its rhythms should, though arithmetical, have no stronger ictus than those of the words. To make them as rigid and forcible as the rhythms of a non-vocal music would produce an effect as intolerable to a Greek ear as a schoolboy's worst jog-trotting scan of poetry. We need not, then, imagine that the human sense of rhythm has suffered any mysterious change, when our best attempts at deciphering the extant fragments of ancient Greek music yield us a rhythm which scholars can explain by the structure of Greek verse, but which gives us no musical sense. Neither here nor in such strange harmonic phenomena as our complete inversion of the art of music into musical science (as ideas as the treatment of "perfect concords " see harmony) do we find any principle involved which is not as true at the present day as it ever was. Ancient musical rhythm shared in the general qualities of that " Flatland " which we know ancient music to have been; modern musical rhythm, like harmony, belongs, as it were, to a three-dimensional musical space with the vast artistic resources of a consistent perspective.

Indeed, we need much the same kind of mental gymnastic in studying the origins of musical rhythm as we need for the much more abstruse subject of harmonic origins. The two subjects soon begin to show interaction. During the period of discant we findmetrical conceptions already strongly modified by two purely musical factors. Firstly, the attempt to make voices produce a harmony from different simultaneous melodies (instead of from combinations conceived as disguised union) brought with it the necessity for differences of length enormously larger than any possible metrical differences. The metrical influence, however, still so predominated, even in the 14th century, as to produce a rhythm based almost exclusively on what would now be called triple time. Secondly, that sense of bodily movement, for which the less clumsy term " dance rhythm " is far too narrow, gained ground, as the only means powerful enough to hold the various "rhythms of the new and growing polyphony together. In the later stages of discant the old metrical conceptions struggled against the grain of the polyphonic for a while, only to succumb in a tangle of inextricable technicality: and the new art, which became coherent in the 15th century, disregarded poetic metre, with little or no loss in capacity to interpret words if the composer had leisure or desire to do so; since, after all, poetic rhythm in its highest forms has a subtle freedom which renders mechanical musical translation worse than useless, while the rhythmic swing of the lighter forms of poetry was soon discovered by the composers of the " Golden Age " to be practically identical with the refined dance-rhythm which they in their lighter moments idealized from folk-music. 1 By the middle of the 15th century polyphony attained such independence that the only rhythms which would hold the flow of independent melodic voices together were those in which a steadily duple or steadily triple rhythm (either of which might be subdivided by the other or by itself) could be felt as an absolutely regular musical tread. Such a rhythm is capable of expressing every poetic foot, either by the difference of stress between notes or by a difference in their length. Moreover, emphasis may be obtained by the pitch of the note, or, again, by its harmonic significance. All these forms of emphasis combine and counteract each other in an infinite variety, till the sense of musical movement becomes as remote from crude dance-rhythm as it is from poetical metre. But though the part played by accent was already of paramount importance in the " Golden Age " of music, it was not allowed to become evident to the ear except in the lighter and more coarse-grained art-forms. Its highest purpose was served as soon as the listener was able to lose all crude rhythmic impulses in a secure feeling that the mass of polyphonic harmony was held together by a general grouping of the rhythmic beats in fours or threes; and individual parts were at least as free to indulge in other rhythms across the main rhythm as they are in the most complex modern music, so long as the harmony was held together by the average grouping, or "time," as we now call it. Hence the rhythmic variety of 16th-century
music is exactly like the harmonic variety, and the limitations and waywardness of the one are no more archaic than those of the other.

When the resources of later music and the treatment of instruments necessitated the publishing of music in score as well as in separate parts, it became necessary to guide the eye by drawing vertical lines (“bars”) at convenient distances. Hence the term “score” (Ger. Partitur, Fr. partition). These divisions naturally coincided with the main rhythmic groups, and eventually became equidistant. This purely practical custom has co-operated with the great increase of rhythmic firmness necessary for the coherence of those large modern forms which decree the shape rather than the texture of the music, until our notions of rhythm may fairly be described as bar-ridden. And, since the vast majority of our musical rhythms absorb the utmost complexity of detail into the most square and symmetrical framework possible, we are taught to regard the “4-bar period” as a normal (or even ultimate) rhythmic principle, instead of contemplating ourselves with broader conceptions which treat symmetry and proportion in time as freedom; if they are treated in space. It is not too strongly emphasized that the bar indicates no universal musical principle.

The havoc brought by mechanical teaching on this point is incalculable, especially in the childish crudeness of current ideas as to the declaration of words in classical and modern music: ideas which mislead even some composers who might have been expected to know better.

As rhythm is contemplated in larger measures, it becomes increasingly difficult to say where the sense of rhythm ends and the sense of proportion begins. The same melody that may be felt as a square and symmetrical piece of proportion in four-bar rhythm if it is taken slowly, will be equally rational as a single bar of “common time” (see below) if it is taken very quickly; and between these two extremes there may be insensible gradations. All that can be laid down is that composers are apt to use short bars where they demand constant strong accent, while long bars will imply smoother rhythms. For example, if the scherzo of Beethoven’s Ninth Symphony were written in instead of bars, then the passages now marked Ritmo di ter battute would have to appear in time, and so the changes of rhythm would be much more visible on paper.

But the tendency to put a strong accent on the first beat of every bar would make this notation an undesirable substitute for Beethoven’s, since it would lead to a neglect of the subordinate accents (all of them bar-accents, as Beethoven writes them). The trio of this scherzo shows the opposite case in the fact that Beethoven first intended to write it in time, but, in order to indicate a more tranquil flow at the same pace, doubled the quantity contained in a bar, substituting alla breve bars, each equal to two of the preceding bars. The alteration produced a discrepancy in the metronome marks, which has always caused controversy among conductors, but the facts admit of only one interpretation. It is clear, then, that the only sound theory of musical rhythm will be that in which each beat, bar, and even form and proportion are relative terms.

The kinds of time (i.e., rhythmic groups forming, as it were, inviable molecules in the structure of any continuous piece of music) that are used in all music from the 15th century onwards are nowadays classified as duple and triple, and each of these may be made of two or three sub-divisions. The duple division of its beats is by two, whether the number of the beats themselves is duple or triple. Compound time is that in which the beats are regularly divided by three, which three subdivisions have a common denominator expresses the size of a beat. Thus a time reckoned as halves, quarters, 8ths, 16ths or even 32nds of the standard note in modern music, the semibreve; and the time-signature placed at the beginning of a piece of music is really a fraction, of which the numerator expresses the number of beats in a bar and the denominator expresses the size of a beat. Thus signifies three crotchets in a bar. Compound time is expressed, not by using normal fractions of a semibreve as main beats and dividing them into triplets, but by using dotted beats. A dot after a note adds another half to its value, and so not only do we obtain the means of expressing a great variety of rhythmic effects (especially quantitative effects of iambic and trochaic character) in all kinds of time, but we are able to use normal fractions of a semibreve as the subordinate beats of compound time. Thus is the compound time obtained by dotting the two crotchets of time, and is thus actually an accent and meaning from time though that also contains six quavers or six smaller compound time fractions in classical music are to be found in the last movements of Beethoven’s Sonata, Op. 111. He begins by dividing bars of into their usual compound time. He then divides the six half-beats of time by three, producing (which he incorrectly calls 16), and lastly he divides the 12 quarter-beats by 3 producing (which he calls ). The special signatures C for time, and for triple time are the last survivals of the time system of the middle ages (see MUSICAL NOTATION). That complicated system of mood, time and proportion was capable of expressing even more highly compound rhythms than our usual time-signatures, though the complexity was in most cases unreal, since the small rhythmic units of ecclesiastical polyphony renders little but the general distinction between duple and triple rhythm audible: especially as the more compound rhythms were not subdivisions but multiples, involving lengths better measurable by an eight-day clock. The masterly drawing by the hand of Christopher Graupner and Costanza Holzschuher Missa l’Homme Armé is one of the rare cases which remain both rhythmic and complex when transcribed in modern score. For genuine articulate complexity the ballroom scene in Mozart’s Don Giovanni has never been surpassed. So real are its three simultaneous rhythms that the deaf persons on the stage actually dance to whichever suits their character. Anomalies such as and time, whether divisible into alternations of and not, or are aesthetically best regarded not as rhythmic units, but as extreme cases of unsymmetrical phrasing, which demand an instrument for special effect.

They tend, however, to group movements into sentences of reactionary squareness; and the movement of Tchaikovsky’s Pathetic Symphony consists of twenty 8-bar periods (twenty-four, counting the repeats) before an unpaired 4-bar phrase is heard in the piano codas. Even if the last is not odd, though it is the 179th, for the rhythm ends with an unwritten bar.

There is, no doubt, a germ of truth in current doctrine as to the fundamental character of 4-bar phrase-rhythms, inasmuch as the human anatomy has a bilateral symmetry with either limb on one side slightly stronger than that on the other. This is probably the basis of our natural tendency to group rhythmic units in pairs, with a stress on the first of each pair; and hence, if our attention is drawn to larger groups, we put more stress on the first of the first pair than on the first of the second; and so with still greater groups, until our immediate and unanalysed sense of rhythm merges into a sense of proportion distributed through time with a clear consciousness of past, present and future. The point at which this merging takes every ordinary purpose of musical rhythm, being capable of expressing clear distinctions far more minute than have ever been regulated before, it is strong enough to merge the whole in the effect of a second; but it is easy to play 16 notes in a second on the pianoforte. (That is to say, musical rhythm continues to be measurable up to the point at which atmospheric vibrations coalesce in the ear as low musical notes). In a series of such rapid notes a single break twice in a second would have a very obvious rhythmic effect directly measured by the ear. If the broken series were levelled into an even series of fourteen notes a second, the rhythmic effect would be entirely different, though the actual difference of pace would be only of a minute. A triplet is readily adapted to other subdivisions where necessary; but such adaptation generally indicates rather a freedom of declamatory rhythm than any absence of arithmetical accuracy. Among the masters of extreme expression in this field Chopin and Schumann are the chief. The reduction of Chopin’s septoles, groups of 13 and other indeterminate, into mutton-cutlet frills. A natural freedom in performance is as necessary for the minuetae of musical rhythm as it is in speech; but such freedom is all but the least valuable end, if it is in basing this freedom on the superative accuracy of the rhythmic notation of the great composers.

1 In the critical edition of Palestrina’s complete works, vol. xii. of the Niemeyer edition (printed in 1872), is printed as in its conflicting shapes; and there is no justification, in a full score intended for scholars, in supplanting the true rhythm of these bar notes by a rough practical compromise.
place depends on the extent to which these larger groups can dominate the details of the rhythm, and this again depends on the listener's capacity for grasping large and slow rhythms. In any case, the only "ultimate" rhythmic element is the tendency to mark off rhythmic beats into pairs, with a stress on the first of each pair. Where this tendency is resisted, the mind will follow the line of least resistance, which will vary according to the pace and detail of the music. Thus in rapid triple time it is easier to seek duplet rhythm in the grouping of bars than in the details within the bars; but if the groups of bars are also triple, or irregular, the mind will fix on the first recurring salient feature for a secondary beat, regardless of inequality in length; rather than, so to speak, hop on one leg indefinitely. On this principle there is a distinct tendency in moderate and slow triple times to throw a secondary accent on the third beat; or sometimes on the second, as in the springing step of the mazurka, where the spring gives energy to the first beat and the descent from it gives poise to the second.

The tendency of small rhythmic groups to build themselves into large and square ones, such as 8-bar, 16-bar and even 32-bar periods, is doubtless important; but the converse tendency of large phrase-rhythms to break up into a taping series is far more significant, since even in its most regular form it is by no means a permanent feature, but always increas- ing in obvious effect, until the subdivisions attain the minuteness (and therewith the expression) of speech rhythms. (A crude example of the device is Diabelli's waltz, on which Beethoven wrote his gigantic 33 variations. See Variations, where the point is illustrated by a diagram.) Regularly expanding rhythm, on the other hand, not only becomes imperceptible as it is carried further, but tends merely to make musical proportions resemble those of a chess-board. In great music the expanding principle is therefore always contrasted with or modified by the tapering principle, which can indeed exist simultaneously with it and with any other. For, to take only three categories, the harmonic changes of a passage may be designed in tapering rhythm while the melodic phrases expand, and the entries of instruments or parts occur on some third principle, regular or irregular. Such interplay need produce no feeling of complexity; indeed, it is an art most neglected by those composers who most rely on the effect of complex rhythm. It is the main discoverable source of that almost dramatic sense of movement that distinguishes the great musical styles from the academic methods which play for ever, and from the anti-academic novelties which end in monotony.

Square rhythms become desirable at climaxes where physical energy dominates thought. Strong final cadences accordingly require that the last chord should fall on an accent; and if the pace is rapid the final chord will probably be not only on an accented beat but on an accented bar. Thus it is quite obvious that there is by a mere oversight one bar too many in the four bars of tremolo quavers at the end of the first movement of Beethoven's Fourth Symphony; for they are followed by an important bar leading to the last three chords, which can only mean (counting bars as beats) — "one, two, three" ("four" being silent and therefore unwritten). A fifth bar of tremolo would correct the rhythm in a more vigorous but more vulgar way by bringing the last chord onto "one" of the next imaginary group of four. The former correction is so obviously right that the imagination makes it in spite of the presence of the superfluous bar, which is instinctively ignored as an accidental prolongation of the tremolo. Where the composer wrote a bar so short as to be permanent, less than the phrase of the piece (as in Beethoven's scherzo), or in bars that are frequently longer than the phrasen (as in most of Mozart's movements in slow or moderate common time), it sometimes becomes impossible to construe the music without carefully calculating where the accents come; and this calculation is most easily made on the assumption that the strongest cadences bring the tonic chord on an accent. Thus, in Beethoven's Sonata in E flat, Op. 27, No. 1, the first bar of the second movement must be preliminary and the first accent must come on the second bar, since the piece refuses to make sense in any other way. Indeed, Beethoven has written some notes twice over in order to bring his double bars and repeat-marks where they will indicate the true rhythmic joints to the eye. (A double-bar is a mere graphic indication of some important sectional division, not necessarily rhythmic or even coincident with a normal bar-stroke.)

Theorists, however, have developed a tendency to assume that all cadences must be strong. More than one critic has told us that the scherzo of Beethoven's Sonata, Op. 28, is in the same predication as that of Op. 27, No. 1; though it not only makes excellent sense with its cadences in the light and weak form in which they appear, but, when reconstructed on the "strong cadence" theory, entirely fails in its middle portion to uphold that theory or to make any other rhythmic sense. And when Professor Prout tells us that the overture to Figaro begins with a silent bar, and that Schubert's Impromptu in B flat is positively ungrammatical in its cadences unless it is entirely rebarred, and when Dr. Riemann turns half the ritornello of a Bach concerto from 4 into 3 time, simply in order to make the sequences coincide with the hardest possible accents; then we can only protest that this is regulating musical aesthetics by criteria too crude for the aesthetics of bricklaying. An edition of Paradise Lost, in which the writer were to rearrange the text in such a way as to violate punctuation marks (except perhaps commas) at the end of the line, would be on precisely the same level of ingenious barbarity.

Few technical terms are entirely peculiar to the subject of musical rhythm; but some obvious terms of syntax, such as phrase, period and section are used with varying degrees of system by all writers on music; and the whole terminology of prosody has been annexed—with such success that we are told in Grove's Dictionary (article "Metre") that "the theme of Weber's Rondo brillante in E flat (Op. 62) is in Anapaestic Tetrameter Brachycatalectic, very rigidly maintained."

One important term has acquired a special significance in music: viz. Syncopation. It means a cross-accent of such strength as to equal or even suppress the main accent; but the use of the term is generally restricted to cases in which the crossaccent is produced by shifting the notes of a melody or a formula so that they fall between the beats instead of upon them. From what we have said as to the almost physical energy of musical rhythm it is obvious that such a phenomenon is of far greater effect and importance in music than it could possibly be in verse, and, to whichever subject the term may belong by priority, extreme caution is needed in extending any musical notion of it to the structure of poetry. (D. F. T.)

RHYTINA, a name applied to the northern sea-cow (Rhytina gigas, or stelleri), a gigantic relative of the manati and dugong, which formerly inhabited Bering and Copper Islands, in the North Pacific, where it was discovered during Bering's voyage in 1741, and subsequently described by Steller, who accompanied that expedition as a naturalist. Bering's half-starved sailors soon reduced the numbers of these comparatively helpless creatures; and it was not long after—probably about the year 1768—that the species, which was the sole representative of its genus, became completely exterminated. The Rhytina was the largest member of the order Sirenia, attaining a length of nearly twenty feet; and had a very thick, rugged, bark-like skin. The jaws, which are bent downwards to moderate extent, are unprovided with teeth, but in life carried ridged hornly plates. The tail was very deeply forked; and the flippers were short and truncated, lacking apparently the terminal joints of the digits.

When the first discovery of this Sirenia was extremely numerous in the bays of Bering Island, where it browsed upon the abundant sea-angels. Its extirpation is due to the Russian sailors and traders who visited the island in pursuit of seals and sea-otters, and who subsisted on its flesh. Numbers of bones have been discovered in the soil of Bering and Copper Islands, from which more or less nearly perfect skeletons have been reconstructed, so that the osteology of this interesting animal is well represented in most of the larger museums.

(R. L.*)
RIANSARES, AUGUSTIN FERNANDEZ MUÑOZ, DUKE OF (1808 or 1810–1873),morganatic husband of Maria Christina, queen and regent of Spain, was born at Tarancón, in the province of Cuenca, in New Castle. His father was the keeper of an estanco or office for the sale of the tobacco of the government monopoly. He enlisted in the bodyguard, and attracted the attention of the queen. According to one account, he distinguished himself by stopping the runaway horses of her carriage; according to another, he only picked up her handkerchief; a third and scandalous explanation of his fortune has been given. It is certain that the queen married him privately, very soon after the death of her husband on the 20th of September 1833. By publishing her marriage, Maria Christina would have forfeited the regency; but her relations with Muñoz were perfectly well known. When on the 13th of August 1836 the soldiers on duty at the summer palace, La Granja, mutinied and forced the regent to grant a constitution, it was generally, though wrongly, believed that they overcame her reluctance by seizing Muñoz, whom they called her gapo, or fancy man, and threatening to shoot him. When in 1840 the queen found her position intolerable and fled the country, Muñoz went with her and the marriage was publicly acknowledged. In 1841 she returned. In 1844 Queen Isabel II., who was now declared to be of age, gave her consent to her mother's marriage, which was publicly performed. Muñoz was created duke of Riansares and made a knight of the Golden Fleece. By Louis Philippe, king of the French, he was created duke of Mont-Morot and Grand Cross of the Legion of Honour. Until his wife was finally driven from Spain by the revolutionary movement of 1854, the duke is credibly reported to have applied himself to making a large fortune out of railway concessions and by judicial stock exchange speculations. Political ambitions he had none, and it is said that he declined the offer of the crown of Ecuador. All authorities agree that he was not only good-looking, but kindly and well-bred. He died five years before his wife at L'Adresse, near Havre, on the 11th of September 1873. Several children were born of the marriage.

RIAZ PASHA (c. 1835–1882), Egyptian statesman, born about 1835, was of a Circassian family, but said to be of Hebrew extraction. Little is known of his early life save that until the accession of Ismail Pasha to the vice-royalty of Egypt in 1861 he occupied a humble position. Ismail, recognizing in this obscure individual a capacity for hard work and a strong will, made him one of his ministers, to find, to his chagrin, that Riaz was also an honest man possessed of a remarkable independence of character. When Ismail's financial straits compelled him to agree to a commission of inquiry Riaz was the only Egyptian of known honesty sufficiently intelligent and patriotic to be named as a vice-president of the commission. He filled this office with distinction, but not to the liking of Ismail. The khedive, however, felt compelled, when as a sop to his European creditors he assumed the position of a constitutional monarch, to nominate Riaz as a member of the first Egyptian cabinet. For the few months this government lasted (September 1878 to April 1879) Riaz was minister of the interior. When Ismail dismissed the cabinet and attempted to resume autocratic rule, Riaz had to fly the country. Upon the deposition of Ismail, June 1879, Riaz was for a time by the British and French courts, and he formed the first ministry under the khedive Tewfik. His administration, marked by much ability, lasted only two years, and was overthrown by the agitation which had for figure-head Arabi Pasha (q.v.). The beginnings of this movement Riaz treated as of no consequence. In reply to a warning of what might happen he said, "But this is Egypt; such things do not happen; you say they have happened elsewhere, perhaps, but this is Egypt." On the evening of the 9th of September 1881, after the military demonstration in Abdin Square, Riaz was dismissed; broken in health he went to Europe, remaining at Geneva until the fall of Arabi. After that event Riaz, subordinating his vanity to his patriotism, accepted office as minister of the interior under Sherif Pasha (q.v.). Had Riaz had his way Arabi and his associates would have been executed forthwith, and when the British insisted that clemency should be extended to the leaders of the revolt Riaz refused to remain in office, resigning in December 1882. He took no further part in public affairs until 1888, when, on the dismissal of Nubar Pasha (q.v.), he was summoned to form a government. He now understood that the only policy possible for an Egyptian statesman was to work in harmony with the British agent (Sir Evelyn Baring—afterwards Lord Cromer). This he succeeded in doing to a large extent, witnessing if not initiating the practical abolition of the cortée and many other reforms. The appointment of an Anglo-Indian official as judicial adviser to the khedive was, however, opposed by Riaz, who resigned in May 1891. In the February following he again became prime minister under Abbas II., being selected as comparatively acceptable both to the khedivial and British parties. In April 1894 Riaz finally resigned office on account of ill-health. Superior, probably, both intellectually and morally to his great rival Nubar, he lacked the latter's broad statesmanship as well as his pliability. Riaz's stand-and-deliver manner, which endeared him to the British, was also his weakness. The Egyptians were not fitted for self-government, he must be treated like children, protected from ill-treatment by others and prevented from injuring themselves. In 1880 he was made an honorary G.C.M.G. A worthy tribute to Riaz was paid by Lord Cromer in his farewell speech at Cairo on the 4th of May 1907. "Little or no courage is now required," said Lord Cromer, "on the part of a young Egyptian who poses as a reformer, but it was not always so. Ismail Pasha had some very drastic methods of dealing with those who did not bow before him. Nevertheless, some thirty years ago Riaz Pasha stood forth boldly to protest against the maladministration that then prevailed in Egypt. He was not afraid to bell the cat."

RIB (from O. Eng. ribb; the word appears in many Teutonic languages, cf. Gcr. Rippe, Swed. rob), in anatomy, the primary meaning—one of the series of elastic arched bones (costae) which form the casing or framework of the thorax (see SKELETON: Axial). The word is in meaning transferred to any rib-like object, particularly a rib, which, in its function in architecture, is thus used of the arches of stones which in medieval work constitute the skeleton of the vault, and carry the weight of vaults. Although in the Roman vault the rib played an important element in its construction, it was generally hidden in the thickness of the vault and was made subservient to its geometrical surfaces. The Gothic masons, on the other hand, reversed the process, and not only made the vaulting surface subservient to the rib, but by mouldings rendered the latter a highly decorative feature. The principal ribs are the transverse (arc doublieu), the diagonal (arc ogive) and the wall rib (formore). Those of less importance are the intermediate, the ridge and lierne ribs. The ridge-rib is one first introduced into the vault to resist the thrust of the intermediate ribs between the wall and diagonal ribs; it also served to mark the junction of the filling-in or web of vaults in those cases where the courses dipped toward the diagonal rib. (See VAULT.) A lierne rib (the term is borrowed from the French) is a short rib, introduced into the vaulting in a particular ribbed vault, which coupled together the transverse and intermediate ribs; in the later period the "lierne" rib becomes one of the chief features of the "stella" vault (see further VAULT).

RIBADENEIRA, PEDRO A. (1527–1611), hagiologist, was born at Toledo on the 1st of November 1527. As a lad he repaired to Rome for study, and there on the 18th of September 1540 was admitted by Ignatius Loyola, in his thirteenth year, as one of the Society of Jesus, which had not yet received papal sanction. He pursued his studies at Paris (1542) in philosophy and theology. Loyola, in 1555, sent him on a mission to Belgium; in pursuance of it he visited England in
RIBALD—RIBBON-FISHES

1558. A later result of his visit was his Historia Ecclesiastica del scisma del Reyno de Inglaterra (1558-1564), often reprinted, and used in later editions of N. Sandier’s De Origine et Progressu Schismatis Anglicani. In 1560 he was made Provincial of the Society of Jesus in Tuscany, thence transferred as Provincial to Sicily in 1563, again employed in Flanders, and from 1571 in Spain. In 1574 he settled in Madrid, where he died on the 10th of September 1611. His most important work is the Life of Loyola (1572), which he was the first to write. In his first edition of the Life, as also in the second enlarged issue (1587), Ribadeneira affirmed that Loyola had wrought no miracle, except the foundation of his Society (thus making his claim parallel with that of Mahomet, whose only miracle, originally, was the Koran). In the process for the canonization of Loyola, a narrative published by Ribadeneira in 1609 exhibited miracles; and these are recorded in an abridgment of the Life by Ribadeneira (published posthumously in 1612) with a statement by Ribadeneira that he had known of them in 1572 but was not then satisfied of their proof. For this change of opinion he is taken to task by Bayle. That Ribadeneira was, though an able, a very credulous writer, is shown by the successors of Loyola in the generalship of the Society, Lainez and Borgia; and especially by his Flos Sanctorum (1590-1610), a collection of saints’ lives, entirely superseded by the labours of the Bollandists. His other works are numerous but of little moment, including his Tratado de la religion (1595), intended as a refutation of Machiavelli’s Prince.

See his autobiography in his Bibliotheca Scriptorum Societatis Jesu (1602 and 1608, supplemented by P. Alegambe and N. Sotwell in 1676); N. Antonio, Biotheca Hispana Nova (1788); Biographie Universelle (Michaud) (1842-1865). (A. Go.)*

RIBALD, a word now only used in the sense of jeering, irreverent, abusive, particularly applied to the uses of low, offensive or mocking jests. It has an interesting early history, of which Du Cange (Gloss. s.v. Ribaldi) gives a full account. It is one of those words, like the Greek ἱππος, an unconstitutual, or the Latin intro, a hired soldier, mercenary, later robber, which have acquired a degraded and equivocal significance. The ribaldi were light-armed soldiers, on whom fell the duty of being first in attack, the fensas perdus or “forlorn hope” of the armies of the French kings; thus Rigordus, in his contemporary history of the reign of Philip Augustus, for the year 1180, speaks of the Ribaldi . . . qui primos impetus in expugnandis munitionibus facere consueverant. Later we find the ribaldi among the rabble of camp-followers of an army, and Giovanni Villani, in his 16th-century Chronicle (11, 139), speaks of ribaldi et i ragazzi del ilosto, and Fosissart of the ribaux as the lowest ranks in an army. Ribaldus (ribauld) was thus a common name for everything ruffianly and abandoned, and Matthew Paris (Ann. 1251) says: Fures, exules, fugitivi, excommunicati, quos omnes Ribaldos Francia vulgariter consuevit appellare. The name (ribaldes or ribaldi) was particularly applied to prostitutes, brothel-keepers and all who frequent haunts of vice, and there was at the French court from the 12th century an official, known as Rex Ribaldorum, king of the ribaldi, through the realm of Charles VI. to Tractatus hasti Regis, whose duty was to investigate and hold judicial inquiry into all crimes committed within the precincts of the court, and control vagrants, prostitutes, brothels and gambling-houses. The etymology of the word has been much discussed, and no certainty can be arrived at. The termination—ald—points to a Teutonic origin, and connexion has been suggested with O.H.G. Hrip, M.H.G. Ribe, prostitute, with Ger. reiben, rub, or with rauben, rob. Neither Skear nor the New English Dictionary find any relation to the English “bawd,” procurers, pander.

RIBAULT (or RIBAUTE), JEAN (c. 1530-1565), French navigator, famous for his connexion with the early settlement of Florida, was born at Dieppe, probably about 1530. Appointed by Admiral Coligny to the command of an expedition to prepare an asylum for French Protestants in America, Ribault sailed on the 18th of February 1562, with two vessels, and on the 1st of May landed in Florida at St John’s river, or, as he called it, Riviere de Mai. Having settled his colony at Fort Royal Harbour (now Paris Island, South Carolina), and built Fort Charles for their protection, he returned to France to find the country in the throes of the Civil War. In 1563 he appears to have been in England and to have issued True and Last Discoverie of Florida (Hakluyt Soc., vol. vii.). In April 1564 Coligny was in a position to despatch another expedition under René de Laudonnière, but meanwhile Ribault’s colony had come to an untimely end—the unfortunate adventurers, destitute of supplies from home, having revolted against their governor and attempted to make their way back to Europe in a boat which was happily picked up, when they were in the last extremities, by an English vessel. In 1565 Ribaut was again sent out to satisfy Coligny as to Laudonnière’s management of his new settlement, Fort Caroline, on the Rivière de Mai. While he was still there the Spaniards, under Menendez de Aviles, though their country was at peace with France, attacked the French ships at the mouth of the river. Ribault set out to retaliate on the Spaniards. When his vessels were wrecked by a storm near Matanzas Inlet and he had to attempt to return to Fort Caroline by land. The fort had by this time fallen into the hands of the Spaniards, who had slaughtered all the colonists except a few who got off with two ships under Ribault’s son. Induced to surrender by false assurances of safeguard, Ribault and his men were also put to the sword in October 1565. The massacre was avenged in kind by Dominique de Gourgues (d. 1563) two years later.

See E. and H. Haag, La France protestante (1846-1859); and F. Ribbeck, Pioneers of France in the New World (new ed., 1899).

RIBBECK, JOHANN CARL OTTO (1827-1868), German classical scholar, was born at Erlfurt in Saxony on the 23rd of July 1827. Having held professorial appointments at Kiel and Heidelberg, he succeeded his tutor Ritschl in the chair of classical philology at Leipzig, where he died on the 18th of July 1868. Ribbeck was the author of several standard works on the poets and poetry of Rome, the most important of which are the De Liber Poeticis (1861), Geschichte der romischen Dichtung (2nd ed., 1894-1900); Die römische Tragödie im Zeitalter der Republik (1875); Scenicae Romanorum Poesis Fragmenta, including the tragic and comic fragments (3rd ed., 1897). As a textual critic he was distinguished by considerable rashness, and never hesitated to alter, rearrange or reject as spurious what failed to reach his standard of excellence. These tendencies are strikingly shown in his editions of the Epistles and Ars Poetica of Horace (1869), the Satiros of Juvenal (1859) and in the supplementary essay Der echte und unechte Juvenal (1863). In later years, however, he became much more conservative. His edition of Virgil (2nd ed., 1894-1895), although only critical, is a work of great erudition, especially the Prolegomena. His biography of Ritschl (1879-1881) is one of the best works of its kind. The influence of his tutor may be seen in Ribbeck’s critical edition of the Miles Gloriosus of Plautus, and Beiträge zur Lehre von den lateinischen Partikeln, a work of much promise, which causes regret that he did not publish further results of his studies in that direction. His miscellaneous Rist und Veröfentliche was published after his death (Leipzig, 1890). He took great interest in the monumental Thesaurus Linguae Latinae, and it was chiefly owing to his efforts that the government of Saxony was induced to assist its production by a considerable subsidy.

The chief authority for his life is Otto Röbbek; ein Bild seines Lebens aus seinen Briefen (1901), ed. by Emma Ribbeck.

RIBBON-FISHES (Trachypetidae), a family of marine fishes readily recognized by their long, compressed, tape-like body, short head, narrow mouth and feeble dentition. A high dorsal fin occupies the whole length of the back; an anal is absent, and the caudal, if present, consists of two fascicles of rays of which the upper is prolonged and directed upwards. The pectoral fins are small, the ventrals composed of several rays, or of one long ray only. Ribbon-fishes possess all the characteristics of fishes living at very great depths. They are
RIBBONISM—RIBBONS

extremely fragile when found floating on the surface or thrown ashore, and rarely in an uninjured condition; the rays of their fins especially, and the membrane connecting them, are of a very delicate and brittle structure. In young ribbon-fishes some of the fin-rays are prolonged in an extraordinary degree, and sometimes provided with appendages (see fig. 2). There are only two genera in the family, Regalecus, the oar-fish, and Trachypterus. In the former the length of the body is about fifteen times its depth. The head likewise is compressed, short, resembling in its form that of a herring; the eye is large; the mouth is small, and provided with very feeble teeth. A long many-rayed dorsal fin, of which the very long anterior rays form a kind of high crest, extends from the top of the head to the end of the tail; the anal and perhaps the caudal fins are absent; but the ventrals (and by this the oar-fish is distinguished from the other ribbon-fishes) are developed into a pair of long filaments, which terminate in a paddle-shaped extremity, but are too flexible to assist in locomotion. The whole body is covered with a layer of silvery epidermoid substance, which easily comes off and adheres to other objects.

Oar-fishes are the largest deep-sea fishes known, the majority of the specimens observed measuring 12 ft. in length; but some are recorded to have exceeded 20 ft. Their range in the great depths of the ocean seems to extend over all seas, but, however numerous they may be in the depths which are their home, it is only by rare accident that specimens reach the surface. Thus from the coasts of Great Britain only about twenty captures are known in the long space of a century and a half, and not more than thirteen from those of Norway. Oar-fishes have been considered by naturalists to have given rise to some of the tales of “sea-serpents,” but their size as well as the facility with which they are secured when observed render this solution of the question of the existence of such a creature improbable. When they rise to the surface of the water they are either dead or in a helpless and dying condition. The ligaments and tissues by which the bones and muscles were held together whilst the fish lived under the immense pressure of great depths have then become loosened and torn by the expansion of the internal gases; and it is only with difficulty that the specimens can be taken entire out of the water and preserved afterwards. Every specimen found has been more or less mutilated; and especially the terminal portion of the tail, which seems to end in a delicate tapering filament, has never been perfect;—it is perhaps usually lost as a useless appendage at a much earlier period of the life of the fish. Of Trachypterus, specimens have been taken in the Atlantic, the Mediterranean, at Mauritius and in the Pacific. The species from the Atlantic has occurred chiefly on the northern coasts, Iceland, Scandinavia, Orkney, and Scotland. It is known as T. arcticus, and in the deal-fish; its Icelandic name is Vaguar. Its length is 5 to 8 ft. Specimens seem usually to be driven to the shore by gales in winter, and are sometimes left by the tide. S. Nilsson, however, in Scandinavia has observed a living specimen in two or three fathoms of water moving something like a flat-fish with one side turned obliquely upwards.

RIBBONISM, the name given to an Irish secret-society movement, which began at the end of the 18th century in opposition to the Orangemen (q.v.), and which was represented by various associations under different names, organized in lodges, and recruited all over Ireland from the lowest classes of the people. The actual name of Ribbonism (from a green badge worn by its members) became attached to the movement later, about 1826; and, after it had grown to its height about 1855, it declined in force, and was practically at an end in its old form when in 1871 the Westminster Act declared Ribbonism illegal. See also under IRELAND: History.

RIBBONS. By this name are designated narrow webs, properly of silk, not exceeding nine inches in width, used primarily for binding and tying in connexion with dress, but also now applied for innumerable useful, ornamental and symbolical purposes. Along with that of tapes, fringes and other small-wares, the manufacture of ribbons forms a special department of the textile industries. The essential feature of a ribbon loom is the simultaneous weaving in one loom frame of two or more webs, going up to as many as forty narrow fabrics in modern looms. To effect the conjoint throwing of all the shuttles and the various other movements of the loom, the automatic action of the power-loom is necessary; and it is a remarkable fact that the self-acting ribbon loom was known and extensively used more than a century before the famous inventions in which A. Cartwright, in 1804, and James Hargreaves, in 1768, an English inventor, in 1739, and François Stéphenot, an inventor of the loom, which could be woven at one time is mentioned as having been working in Dantzic towards the end of the 16th century. Similar looms were at work in Leiden in 1620, where their use gave rise to so much discontent and rioting on the part of the weavers that the states-general had to prohibit their use. The prohibition was renewed at various intervals throughout the century, and in the same interval the use of the ribbon loom was interdicted in most of the principal industrial centres of Europe. About 1676, under the name of the Dutch loom or engine loom, it was brought to London; and, although its introduction there caused some disturbance, it does not appear to have been prohibited. In 1745, John Kay, the inventor of the fly-shuttle, obtained, jointly with Joseph Stell, a patent for improvements in the ribbon loom; and since that period it has benefited by the inventions applied to weaving machinery generally.

Ribbon-weaving is known to have been established near St Étienne (dép. Loire) as early as the 17th century, and that town had the headquarters of the industry. During the Huguenot troubles, ribbon-weavers from St Étienne settled at Basel and there established an industry which in modern times has rivalled that of the original seat of the trade. Crefeld is the centre of the German ribbon industry, the manufacture of black velvet ribbon being there a specialty. In England Coventry is the most important seat of ribbon-making, which is also prosecuted at Norwich and Leicester.
RIBEIRA—RIBERA

RIBEIRA, a town of north-western Spain, in the province of Corunna, on the extreme south-west of the peninsula formed between the rivers of Muros y Noia and Arosa Bay. Pop. (1900) 12,218. Ribeira is in a hilly country, abounding in wheat, wine, fruit, fish and game. Its port is Santa Eugenia de Ribeira, on Arosa Bay. The population is chiefly occupied in agriculture, cattle-breeding and fisheries.

RIBEIRO, BERNARDIM (1482-1552), the father of bucolic prose and verse in Portugal, was a native of Torrão in the Alentejo. His father, Damião Ribeiro, was implicated in the conspiracy against King John II. in 1484, and had to flee to Castile, whereupon young Bernardim and his mother took refuge with their relations Antonio Zagalo and D. Ignez Zagalo at the Quinta dos Lobos, near Chitra. When King Manoeo came to the throne in 1495, he rehabilitated the families persecuted by his predecessor, and Ribeiro was able to leave his retreat and return to Torrão. Meanwhile D. Ignez had married a rich landowner of Estremoz, and in 1503 she was summoned to court and appointed one of the attendants to the Infanta D. Beatriz. Ribeiro accompanied her, and through her influence the King took him under his patronage, and sent him to the University of Lisbon, where he studied from 1506 to 1512. When he obtained his degree in law, the King showed him further favour by appointing him to the post of Escrivão da Câmara, or secretary, and later by bestowing on him the habit of the military order by São Thiago. Ribeiro's poetic career commenced with his coming to court, and his early verses are to be found in the Cancioneiro Geral de Garcia de Resende (q.v.). He took part in the historic Serras do Paço, or palace evening entertainments, which largely consisted of poetically improvisations; there he met and earned the friendship of the poets Sá de Miranda (q.v.) and Christovão Falcão (q.v.), who became his literary comrades and the confidants of his romance, in which hope deferred and bitter disappointment ended in tragedy. Ribeiro had early conceived a violent passion for his cousin, D. Joanna Zagalo, the daughter of his protectress, D. Ignez; but, though she seems to have returned it, her family opposed her marriage to a singer and dreamer with small means and prospects, and finally compelled her to wed a rich man, one Pero Gato. When the latter met a violent death shortly afterwards, D. Joanna retired to a house in the country, and it is alleged that Ribeiro visited her, and that her amours resulted in the birth of a child. All we know positively, however, is that in 1521 the lady went into seclusion in the convent of St Clare at Estremoz, where she fell a victim to a violent form of insanity, and that she died there some years later. It is further alleged that Ribeiro's conduct had caused a scandal which led the King to deprive him of his office and exile him. But the loss of position and income can have added very little to the poignant grief of such a true lover and profound idealist as Bernardim Ribeiro. He had poured out his heart in five beautiful eclogues, the earliest in Portuguese, written in the popular octosyllabic verse; and now, hopeless of the future and broken in spirit, he decided to go to Italy, for he loved the land of promise. He arrived in his native land in 1524, and during his stay he wrote his moving knightly and pastoral romance Menina e Moça, in which he related the story of his unfortunate passion, personifying himself under the anagram of "Rinnarder," and D. Ignez under that of "Aonha." When he returned home in 1524, the new king, John III., restored him to his former post, and it is said that he paid a last visit to his love at St Clare's convent and found her in a fit of raving madness. This no doubt preyed on a mind already unhinged by trouble, and hastened the decline of his mental powers, which had already commenced. About 1534 a long illness supervened, and the years that elapsed between that year and his death may be described as the night of his soul. He was quite unable to fulfil the duties of his office, and in 1549 the king bestowed upon him a pension for his support; but he did not live long to enjoy it, for in 1552 he died insane in All Saints Hospital in Lisbon.

The Menina e Moça was not printed until after Ribeiro's death, and then first in Ferrara in 1554. On its appearance the book made such a sensation that its reading was forbidden, because, though it contained nothing heterodox, it disclosed a family tragedy which the allegory could not hide. It is divided into two parts, the first of which is certainly the work of Ribeiro, while as to the second opinion is divided, though Dr Theophilo Braga considers it genuine and explains its progressive lack of lucidity and order by the mental illness of the author. The first part has been ably edited by Dr José Pessanha (Oporto, 1891). Ribeiro's verses, including his five eclogues, which for their sincerity of feeling, simple diction and chaste form are unsurpassed in Portuguese literature, were reprinted in a limited édition de luxe by Dr Xavier da Cunha (Lisbon, 1886).

AUTHORITIES.—Visconde Sanches de Baena, Bernardim Ribeiro (Lisbon: 1895); Dr Theophilo Braga, Bernardim Ribeiro e Bucelismo (Oporto, 1897), containing a full analysis of Ribeiro's novel (sometimes called the Saudades, though it is more commonly described as a romance, by the initial words of the story, Menina e Moça).

RIBERA, GIUSEPPE (1568-1650), commonly called Lo Spagnoletto, or the Little Spaniard, a leading painter of the Neapolitan or partly of the Spanish school, was born near Valencia in Spain, at Xativa, now named S. Felipu, on 12th January 1568. His parents intended him for a literary or learned career; but he neglected the regular studies, and entered the school of the Spanish painter Francisco Ribalta. Fired with a longing to study art in Italy, he somehow made his way to Rome. Early in the 17th century a cardinal noticed him in the streets of Rome drawing from the frescoes on a palace façade; he took him up the ragged striping and housed him in his mansion. Artists had then already bestowed upon the alien student, who was perpetually copying all sorts of objects in art and in nature, the nickname of Lo Spagnoletto.

In the cardinal's household Ribera was comfortable but dissatisfied, and one day he decamped. He then betook himself to the famous painter Michelangelo da Caravaggio, the head of the naturalist school, called also the school of the Tenebrosi, shadow-intentiveness to the exclusive contrived light and shade which marked their style. The Italian master gave every encouragement to the Spaniard, but not for long, as he died in 1609. Ribera, who had in the first instance studied chiefly from Raphael and the Caracci, had by this time acquired so much mastery over the tenebrosity that his performances were barely distinguishable from Caravaggio's own. He now went to Parma, and worked after the frescoes of Correggio with great zeal and efficiency: in the museum of Madrid is his "Jacob's Ladder," which is regarded as his chef-d'œuvre in this manner. From Parma Spagnoletto returned to Rome, where he resumed the style of Caravaggio, and shortly afterwards he migrated to Naples, which became his permanent home.

Ribera was as yet still poor and inconspicuous, but a rich picture-dealer in Naples soon discerned in him all the stuff of a successful painter, and gave him his daughter in marriage. This was the turning-point in the Spaniard's fortunes. He painted a " Martyrdom of St Bartholomew," which the father-in-law exhibited from his balcony to the rapidly increasing and admiring crowd. The popular excitement grew to so noisy a height as to attract the attention of the Spanish viceroy, the Count de Monterey. From this nobleman and from the king of Spain, Philip IV., commissions now flowed in upon Ribera. With prosperity came grasping and jealous selfishness. Spagnoletto, chief in a triumvirate of greed, the " Cabal of Naples," his abettors being a Greek painter, Belisario Corenzio, and a Neapolitan, Giambattista Caracciolo, determined that Naples should be an artistic monopoly; by intrigue, terrorizing and personal violence on occasion they kept aloof all competitors. Aninnabile Caracci, the Cavalier d'Arpino, Guido, Domenichino, all of them successively invited to work in Naples, found the place too hot to hold them. The cabal ended at the time of Caracciolo's death in 1641.

The close of Ribera's triumphant career has been variously related. If we are to believe Dominici, the historian of Neapolitan art, he totally disappeared from Naples in 1648 and
was no more heard of—this being the sequel of the abduction by Don John of Austria, son of Philip IV., of the painter's beautiful only daughter Maria Rosa. But these assertions have not availed to displace the earlier and well-authenticated statement that Ribera died peaceably and Cenere Nativitas in 1656. His own signature on his pictures is constantly "Jusepe de Ribera, Español." His daughter, so far from being disgraced by an abduction, married a Spanish nobleman who became a minister of the viceroy.

The pictorial style of Spagnoletto is extremely powerful. In his earlier style, founded (as we have seen) sometimes on Caravaggio and sometimes on the wholly diverse method of Correggio, the study of Spanish and Venetian masters can likewise be traced. Along with his massive and predominating shadows, he retained from first to last great strength of local colouring. His forms, though ordinary and partly gross, are correct; the impression of his works gloomy and startling. He delighted in subjects of horror. Salvador Rosa and Luca Giordano were his most distinguished pupils; also Giovanni Do, Enrico Fiammingo, Michelangelo Fracanzani, and Aniello Falcone, who was the first considerable painter of battle-pieces. Among Ribera's principal works should be named "St Januarius Emerging from the Furnace," in the cathedral of Naples; the "Devil's Dance," in the Library of the University of Madrid, regarded as his masterpiece; the "Adoration of the Shepherds" (a late work, 1659), now in the Louvre; the "Martyrdom of St Bartholomew," in the museum of Madrid; the "Pietà," in the sacristy of S. Martino, Naples. His mythologic subjects are generally unpleasant—such as the "Silenus," in the Studj Gallery of Naples, and "Venus Lamenting over Adonis," in the Corsini Gallery of Rome. The Louvre contains altogether twenty-five of his paintings; the National Gallery, London, two—one of them, a "Pietà," being an excellent though not exactly a leading specimen. He executed several fine male portraits; among others his own likeness, now in the collection at Alton Towers. He also produced twenty-six etchings, ably treated. For the use of his pupils, he drew a number of elementary designs, which in 1650 were etched by Francisco Fernandez, and which continued much in Vogue for a long while among Spanish and French painters and students.

Besides the work of Dominici already referred to (1840-46), the Diccionario Historico of Cean Bermudez is a principal authority regarding Ribera and his works; also E. de Lalangue, Ribera (in Histoire de quatre grands peintres), 1888.

RIBOT, ALEXANDRE FÉLIX JOSEPH (1842-), French statesman, was born at St Omer on 7th February 1842. After a brilliant career at the university of Paris, where he was lauréat of the faculty of law, he rapidly made his mark at the bar. He was secretary of the conference of advocates and one of the founders of the Société de législation comparée. During 1875 and 1876 he was successively director of criminal affairs and secretary-general at the ministry of justice. In 1877 he made his entry into political life by the conspicuous part he played on the committee of legal resistance during the Broglie ministry, and in the following year he was returned to the chamber as a moderate republican member for Boulogne, in his native department of Pas-de-Calais. His impassioned yet reasoned eloquence gave him an influence which was increased by his articles in the Parlement in which he opposed violent measures against the unauthorized congregations. He devoted himself especially to financial questions, and in 1882 was reporting to the chamber on the budget. He became one of the most prominent republican opponents of the Radical party, distinguishing himself by his attacks on the short-lived Gambetta ministry. He refused to vote the credits demanded by the Ferry cabinet for the Tongking expedition, and shared with M. Clémenceau in the overthrow of the ministry in 1885. At the general election of that year he was one of the victims of the Republican rout in the Pas-de-Calais, and did not re-enter the chamber till 1887. After 1889 he sat for St Omer. His fear of the Boulangist movement converted him to the policy of "Republican Concentration," and he entered office in 1890 as foreign minister in the Freycinet cabinet. He had an intimate acquaintance and sympathy with English institutions, and two of his published works—address, Biographie de Lord Erskine (1866), and L'Étude sur l'acte du 4 avril 1879 pour l'établissement d'une cour suprême de justice en Angleterre (1874)—deal with English questions; he also gave a fresh and highly important direction to French policy by the understanding with Russia, which was declared to the world by the visit of the French fleet to Cronstadt in 1891, and which subsequently ripened into a formal treaty of alliance. He retained his post in the Loubet ministry (February—November 1892), and on its defeat became himself president of the council, retaining the direction of foreign affairs. The government resigned in March 1893 on the refusal of the chamber to accept the Senate's amendments to the budget. On the election of Félix Faure as president of the Republic in January 1895, M. Ribot again became premier and minister of finance. On the 10th of June he was able to make the first official announcement of a definite alliance with Russia. On the 70th of October the government was defeated on the question of the Chemin de fer du Sud, and resigned office. The real reason of its fall was the mismanagement of the Madagascar expedition, the cost of which in men and money exceeded all expectations, and the alarming social demand for the suppression of the Madagascar expedition. After the fall of the Mélone ministry in 1898 M. Ribot tried in vain to form a cabinet of "conciliation." He was elected, at the end of 1898, president of the important commission on education, in which he advocated the adoption of a modern system of education. The policy of the Waldeck-Rousseau ministry on the religious teaching congregations broke up the Republican party, and M. Ribot was among the seceders; but at the general election of 1902, though he himself secured re-election, his policy suffered a severe check. He actively opposed the policy of the Combes ministry and denounced the alliance with M. Jaurès, and on the 13th of January 1905 he was one of the leaders of the opposition which brought about the fall of the cabinet. Although he had been most violent in denouncing the anti-clerical policy of the Combes cabinet, he now announced his willingness to recognize a new régime to replace the Concordat, and gave the government his support in the establishment of the Associations cultuelles, while he secured some mitigation of the severities attending the separation made to be reached in 1892. In the same year he became a member of the French Academy in succession to the duc d'Audiffret-Pasquier; he was already a member of the Academy of Moral and Political Science. In justification of his policy in opposition he published in 1905 two volumes of his Discours politiques.

RIBOT, THÉODULE (1823-1891), French painter, was born at Breteuil, in Eure, in 1823, and died at Bois Colombes, near Paris, in September 1891. A pupil nominally of Glaze, but more really of Ribera, of the great Flemings and of Chardin, Théodule Ribot had yet consistently his own noble and personal vision, his own intensity of feeling and rich sobriety of performance. Beginning to work seriously at art when he was no longer extremely young, and dying before he was extremely old, Ribot crowded into some thirty or thirty-five years of active practice very varied achievements; and he worked in at least three mediums, oil paint, pencil or crayon draughtsmanship and the needle of the etcher. His drawings were sometimes "complete in themselves," and sometimes auxiliary but powerful preparations for his final etchings. The etchings, of which there are only about a couple of dozen, are of the middle period of his practice; they show a diversity of method as well as of theme; the work in the well-nigh Velasquez-like "Prière"—a group of children—contrasting strongly with that process almost of outline alone, which he employed in the brilliant little group of prints which record his vision of the character and humour of cooks and kitchen-boys. In etching, the method varied with the theme—not with the period. It is quite otherwise with the paintings. Here the earlier work, irrespective of its subject, is the drier
and the more austere; the latter work, irrespective of its subject, the freer and broader. But even in that which is quite early there is a curious and impressive intensity of conception and presentation. His visions of elderly women and young girls remain upon the memory. His women, the children, his young girls, are the quintessence of innocence and happy hopefulness, and life is a jest to his boys. His religious pieces, in which Ribera affected him, have conviction and force. Into portraits and into character studies, but more especially into genre subjects, Ribot was apt to introduce Still-life, and to make much of it. Herein, as in his sense of homeliness, he resembled Chardin. But again, Chardin-like, he painted Still-life for its own sake, by itself, and always with an extraordinary sense of the solidity and form, the texture and the hue, and, it must be added also, the very charm of matter. (F. W.)

RIBOT, THÉODULE ARMAND (1839— ), French psychologist, was born at Guingamp on the 18th of December 1839, and was educated at the Lycée de St Brieuc. In 1856 he began to teach, and was admitted to the École Normale Supérieure in 1859. In 1855 he gave a course of lectures on "Experimental Psychology" at the Sorbonne, and in 1888 was appointed professor of that subject at the College of France. His thesis for his doctor's degree, republished in 1885, Héritéid: étude psychologique (5th ed., 1890), is his most important and best known book. Following the experimental and synthetic methods, he has brought together a large number of instances of inherited peculiarities; he pays particular attention to the physical element of mental life, ignoring all spiritual or non-material factors in man. In his work on La Psychologie anglaise contemporaine (1870), he shows his sympathy with the sensationalist school, and again in his translation of Herbert Spencer's Principles of Psychology. Besides numerous articles, he has written on Schopenhauer, Philosophie de Schopenhauer (1874, 7th ed., 1890), and on the contemporary psychology of Germany (La Psychologie allemande contemporaine, 1879, 13th ed., 1898), and also four monographs on Les Maladies de la mémoire (1881; 13th ed., 1898); De la volonté (1883; 14th ed., 1890); De la personnalité (1885; 8th ed., 1899); and La Psychologie de l'attention (1888), which supply useful data to the student of mental disease.

Other works by him are:—La Psychologie des sentiments (1866); L'Évolution des idées générales (1897); Essai sur l'imagination créatrice (1900); La Logique des sentiments (1904); Essai sur les passions (1906). Of the above the following have been translated into English:—English Psychology (1873); Héritéid: a Psychologie anglaise contemporaine; Les Maladies de la mémoire (1881; 13th ed., 1898); Diseases of Memory: An Essay in the Positive Psychology (1882); Diseases of the Will (New York, 1884); German Psychology of 10-day, tr. J. M. Baldwin (New York, 1886); The Psychology of Attention (Open Court Publishing Company, Chicago, 1900); Diseases of Personality (Chicago, 1895); The Psychology of the Emotions (1897); The Evolution of General Ideas, tr. F. A. Welby (Chicago, 1899); Essay on the Creative Imagination, tr. A. H. N. Baron (1906).

RICARDO, LOUIS GUSTAVE (1823-1875), French painter, was born in Marseilles in 1823, and studied first under Auber in his native town, and secondly under Coignet in Paris. The formation of his masterly, distinguished style under portraitraiture was, however, due rather to ten years' intelligent copying of the old masters at the Louvre and at the Italian galleries, than to any school training. He was a master of technique, and his portraits—about two hundred—reveal an extraordinary insight into the character of his sitters. Nevertheless, after his death his works was almost forgotten by the public, and it is only of quite recent years that he has been conceded the position among the leading masters of the modern French school which is his due. A portrait of himself, and one of Alfred de Musset, are at the Luxembourg Gallery. Among his best known works are the portrait of his mother, and those of the painters Fromentin, Heiblout and Chaplin.

In the Proposals for an Economical and Secure Currency (1816) he first disposes of the chimaera of a currency without a specific standard, and pronounces in favour of a single metal, with a preference for silver, as the standard.

Ricardo's chief work, Principles of Political Economy and Taxation, appeared in 1817. The fundamental doctrine of this work is that, on the hypothesis of free competition, exchange value is determined by the labour expended in production,—a proposition not new, nor, except with considerable limitation and explanation, true, and of little practical use, as "amount of labour" is a vague expression, and the thing intended is incapable of exact estimation. Ricardo's theory of distribution has been briefly enunciated as follows:—(1) The demand for food determines the margin of cultivation; (2) this margin determines rent; (3) the amount necessary to maintain the labourer determines wages; (4) the difference between the amount produced by a given quantity of labour at the margin and the wages of that labour determines profit.

These theorems are too absolutely stated, and require much modification to adapt them to real life. His theory of foreign trade has been embodied in the two propositions:—(1) International values are not determined in the same way as domestic values; (2) the medium of exchange is determined so as to bring into the condition it would be in if it were conducted by barter.

A considerable portion of the work is devoted to a study of taxation, which requires to be considered as a part of the problem of distribution. A tax is not always paid by those on whom it is imposed; it is therefore necessary to determine the ultimate, as distinguished from the immediate, incidence of every form of taxation. Smith had already dealt with this question; Ricardo develops and criticizes his results. The conclusions at which he arrives are in the main as follows:—a tax on raw produce falls on the consumer, but will also diminish profits; a tax on rents on the landlord; taxes on houses will be divided between the occupier and the ground landlord; taxes on profits will be paid by the consumer, and taxes on wages by the capitalist.

In 1819 Ricardo, having retired from business and become a landed proprietor, entered parliament as member for Portarlington. He was at first diffident and embarrassed in speaking, but gradually overcame these difficulties, and was heard with much attention and deference, especially when he entered into argument on economic questions. He probably contributed in a considerable degree to bringing about the change of opinion on the question of free trade which ultimately led to the legislation of Sir Robert Peel on that subject.

In 1820 he contributed to the supplement of the Encyclopaedia Britannica (6th ed.) an "Essay on the Funding System." In this besides giving an historical account (founded on Dr Robert Hamilton's valuable work On the National Debt, 1813, 3rd ed., 1818) of the several successive forms of the sinking fund, he urges that nations should defray their expenses, whether ordinary or extraordinary, at the time when they are incurred, instead of providing for them by loans.

In 1822 he published a tract On Protection to Agriculture, which is an able application to controversy of the general principles laid down in his systematic work. Its arguments and conclusions are therefore subject to the same limitations which those fundamental principles require.

In his Plan for the Establishment of a National Bank, published posthumously in 1854, he propounded the issue of the paper currency should be taken out of the hands of the Bank of England and vested in commissioners appointed by the government. The tract describes in detail the measures to be adopted for the introduction and working of the system. A certain step towards realizing the objects of his scheme, though on different lines from Ricardo's, was taken in Sir Robert Peel's act of 1844, by which the discount business of the bank was separated from the issue department.

Ricardo died on the 11th of September 1823, at his seat (Gatomb Park) in Gloucestershire, from a cerebral affection resulting from disease of the ear. James Mill, who was intimately acquainted with him, says (in a letter to Napier of November 1823) that he knew not a better man. When on the occasion of his death published a highly eulogistic notice of him in the Morning Chronicle. A lecturership on political economy, to exist for ten years, was founded in commemoration of him, M'Culloch being chosen to fill it.

In forming a general judgment respecting Ricardo, we must have in view not so much the minor writings as the Principles, in which his economic system is expounded as a whole. By a study of this work we are led to the conclusion that he was an economist only, not at all a social philosopher in the wider sense, like Adam Smith or John Mill. He had great acuteness, but little breadth. For any large treatment of moral and political questions he seems to have been alike by nature and preparation unfruitful; and there is no evidence of his having had any but the most ordinary and narrow views of the great social problems. He shows no trace of that hearty sympathy with the working classes which breaks out in several passages of the Wealth of Nations; we ought, perhaps, with Held, to regard it as a merit in Ricardo that he does not cover with fine phrases his deficiency in warmth of social sentiment.

The admirers of Ricardo are not surpassed by his employers of his work, which is a greater work, but he never seems to occur to him; the labourer is, in fact, merely an instrument in the hands of the capitalist, a pawn in the game he plays.

He first introduced into economics on a great scale the method of deduction from a priori assumptions. The conclusions so arrived at have often been treated as if they were directly applicable to real life, and indeed to the economic phenomena of all times and places. But the truth of Ricardo's theorems is now by his warmest admirers admitted to be the same as it may, we now see that the only basis on which these doctrines could be allowed to stand as a permanent part of economic science is that on which they are based by Roscher, namely, as a stage in the preparatory work of the economist, who, beginning with such abstractions, afterwards turns from them, not in practice merely, but in the completed theory, to real life and men as they actually are or have been.

The criticisms to which Ricardo's general economic scheme is open do not hold with respect to his treatment of the subjects of currency and banking. These form precisely that branch of economics into which moral ideas (beyond the plain prescriptions of honesty) can scarcely be said to enter, and where the operation of purely mercantile principles is most immediate and inevitable. They were, besides, the departments of the study to which Ricardo's early training and practical habits led him to give special attention; and they have a lasting value independent of his systematic construction.

Ricardo's collected works were published, with a notice of his life and writings, by J. R. M'Culloch in 1846. The Principles have been edited (with an introduction, bibliographical notes) by C. H. M. Mill. See also Letters to H. Treavor and Others, ed. J. Bonar and J. H. Hollander, 1899; Letters to J. R. M'Culloch, ed. J. H. Hollander, 1895; Letters to T. R. Malthus, ed. J. Bonar, 1887. A French translation of the Principles by Constancio, with notes by Say, appeared in 1881; the whole works, translated by Constancio and Fonteyraud, form vol. xii. (1847) of the Collection des principaux économistes, where they are accompanied by the notes of Say, Malthus, Sismondi, Stolz, and Thiers. The Principles of political economy, says Roscher (though another version by Von Schmid had previously appeared), by Edward Baumstark in his David Ricardo's Grundgedanken der Volkswirtschaft und der Bestimmung übersees, 2nd ed. (1857), Roscher highly commends, not only for the excellence of the rendering, but for the value of the explanations and criticisms which are added.

Ricasoli, Bettino, Baron (1809–1888), Italian statesman, was born at Broglie on the 15th of March 1809. Left an orphan at eighteen, with an estate heavily encumbered, he was by special decree of the grand duke of Tuscany declared of age, and
entrusted with the guardianship of his younger brothers. In
terrupting his studies, he withdrew to Broglio, and by careful
management disembursed the family possessions. In 1847
he founded the journal La Patria, and addressed to the
grand duke a memorial suggesting remedies for the difficulties of the
state. In 1848 he was elected Gonfaloniere of Florence, but
resigned on account of the anti-Liberal tendencies of the grand
duke. As Tuscan minister of the interior in 1859 he promoted
the union of Tuscany with Piedmont, which took place on the
12th of March 1860. Elected Italian deputy in 1861, he succeeded
Cavour in the premiership. As premier he admitted the Garibal-
dian volunteers to the regular army, revoked the decree of exile
against Mazzini, and attempted reconciliation with the Vatican;
but his efforts were rendered ineffectual by the non possimus
of the pope. Disdainful of the intrigues of his rival Rattazzi,
he found himself obliged in 1862 to resign office, but returned
to power in 1886. On this occasion he refused Napoleon III.'s
offer to cede Venetia to Italy, on condition that Italy should
abandon the Prussian alliance, and also refused the Prussian
decoration of the Black Eagle because Lamarmora, author of
the alliance, was not to receive it. Upon the departure of the French
troops from Rome at the end of 1866 he again attempted to
conciliate the Vatican with a convention, in virtue of which
Italy would have restored to the Church the property of the
suppressed religious orders in return for the gradual payment
of £24,000,000. In order to mollify the Vatican he conceded the
exequatur to forty-five bishops inimical to the Italian régime.
The Vatican accepted his proposal, but the Italian Chamber
proved refractory, and, though dissolved by Ricasoli, returned
more hostile than before. Without waiting for a vote, Ricasoli
resigned office and thenceforward practically disappeared from
political life, speaking in the Chamber only upon rare occasions.
He died at Broglio on the 23rd of October 1880. His private life
and public career were marked by the utmost integrity, and
by a rigid austerity which earned him the name of the "iron
baron." In spite of the failure of his ecclesiastical scheme, he
remains one of the most noteworthy figures of the Italian
Risorgimento.

Ricasoli, 10 vols. (Florence, 1886–1894); Passerini, Genealogia
e e storia della famiglia Ricasoli (ibid. 1861); Gotti, Vita del barone
Bettino Ricasoli (ibid. 1894).

RICCATI, JACOPO FRANCESCO, COUNT (1676–1754), Italian
mathematician, was born at Venice on the 8th of May 1676,
and died at Treviso on the 15th of April 1754.
He studied at the university of Padua, where he graduated in
1696. His favourite pursuits were scientific, and his authority
on all questions of practical science was referred to by the
senate of Venice. He corresponded with many of the European
savants of his day, and contributed largely to the Acta Erudi-
torum of Leipzig. He was offered the presidency of the academy
of science of St Petersburg; but he declined, preferring the
lawn and the change of life in Italy. Riccati's name is known in connexion with his problem called Riccati's equation,
published in the Acta Eruditorum, September 1724. A very
complete account of this equation and its various transforma-
tions was given by J. W. L. Glashier in the Phil. Trans. (1881).

After Riccati's death his works were collected by his sons and
published (1758) in four volumes. His sons, Vincenzo (1707–
1775) and Giordano (1709–1790), inherited his talents. The
former was professor of mathematics at Bologna, and published,
among other works, a treatise on the infinitesimal calculus,
which was distinguished both as a mathematician and an architec-

RICCI, MATTEO (1552–1610), Italian missionary to China,
was born of a noble family at Macerata in the March of Ancona on
the 7th of October 1552. After some education at a Jesuit
college in his native town he went to study law at Rome, where
in 1571, in opposition to his father's wishes, he joined the Society
of Jesus.
In 1577 Ricci and other students offered themselves for the
East Indian missions. Ricci, without visiting his family to take
leave, proceeded to Portugal. His comrades were Rodolfo
Acquaviva, Nicolas Spinola, Francesco Pasio and Michele
Ruggieri, all afterwards, like Ricci himself, famous in the Jesuit
annals. They arrived at Goa in September 1578. After four
years spent in India, Ricci was summoned to the task of opening
China to evangelization.

Several fruitless attempts had been made by Xavier, and
since his death, to introduce the Church into China,—as by
Melchior Nunes of the Jesuit Society operating from Sanchien
in 1555; by Gaspar da Cruz, a Dominican, in that or the follow-
ning year; by the Augustinians under Martin Herrada, 1575;
and in 1579 by the Franciscans led by Pedro d'Alfaro. In 1577
a house of the Jesuits had been set up at Macao (where the
Portuguese were established in 1557), but their attention was
then occupied with Japan, and it was not till the arrival at
Macao of Alessandro Valignani in a visitation in 1582 that work
in China was really taken up. For this object he had obtained
the services first of M. Ruggieri and then of Ricci. After various
disappointments they found access to Chow-king-fu on the Si-
Kiang or West River of Canton, where the viceroy of the two
provinces of Kwang-tung and Kwang-si then had his residence,
and by his favour were able to establish themselves there for
some years. Their proceedings were very cautious and tentative;
they excited the curiosity and interest of even the more intelli-
gent Chinese by their clocks, their globes and maps, their books
of European engravings, and by Ricci's knowledge of mathe-
matics, including dialling and the projection of maps. They
conciliated some influential friends, and their reputation spread
widely in China. This was facilitated by the Chinese system of
transfer of native officers from one province of the empire to
another, and in the later movements of the old acquaintances
in office, who were more or less well disposed. Eventually
troubles at Chow-king compelled them to seek a new home;
and in 1589, with the viceroy's sanction, they migrated to
Chang-chow in the northern part of Kwang-tung, not far from the
well-known Miling Pass.

During his stay here Ricci was convinced that a mistake had
been made in adopting a dress resembling that of the bonzes,
a class who were the objects either of superstitition or of contempt.
With the sanction of the visitor it was ordered that in future the
missionaries should adopt the costumes of Chinese literates,
and, in fact, they before long adopted Chinese fashions altogether.

Chang-chow, as a station, did not prove a happy selection,
but it was not till 1595 that an opportunity occurred of travelling
northward. For some time Ricci's residence was at Nan-chang-
fu, the capital of Kiang-si; but in 1598 he was able to proceed
under favourable conditions to Nan-king, and thence for the
first time to Peking, which had all along been the goal of his
missionary ambition. But circumstances were not then pro-
pitious, and the party had to return to Nan-king. The fame of
the presents which they carried had, however, reached the court,
and the Jesuits were summoned north again, and on the 24th
of January 1603 they entered the capital. Wan-li, the emperor
of the Ming dynasty, in those days lived in seclusion, and saw
no one but his women and the eunuchs. But the missionaries
were summoned to the palace; their presents were immensely ad-
mired, and the emperor had the curiosity to send for portraits
of the fathers themselves.

They obtained a settlement, with an allowance for subsistence,
in Peking, and from this time to the end of his life Ricci's
estimation among the Chinese was constantly increasing, as was
at the same time the amount of his labours. Visitors thronged
the mission house incessantly; and inquiries came to him from
all parts of the empire respecting the doctrines which he taught,
and the numerous Chinese publications which he issued. This
in itself was a great burden, as Chinese composition, if wrong
impressions are to be avoided, demands extreme care and
accuracy. As head of the mission, which now had four stations

1 The island (properly Chang-chuen) on which the Portuguese
had a temporary settlement before they got Macao, and on which
F. Xavier died in 1552.
in China, he also devoted much time to answering the letters of the priests under him, a matter on which he spared no pains or detail. New converts had to be attended to—always welcomed, and never hustled away. Besides these came the composition of his Chinese books, the teaching of his people and the maintenance of the record of the mission history which had been enjoined upon him by the general of the order, and which he kept well up to date. Thus his labours were wearing and incessant. In May 1610 he broke down, and after an illness of eight days died on the 11th of that month. His colleague Pantoja applied to the emperor for a burying-place outside the city. This was granted, with the most honourable official testimonials to the reputation and character of Ricci; and a large building in the neighbourhood of the city was at the same time bestowed upon the mission for their residence.

Ricci's work was the foundation of the subsequent success at Peking. When the missionaries of other Roman Catholic orders made their way into China, twenty years later, they found great fault with the manner in which certain Chinese practices had been dealt with by the Jesuits, a matter in which Ricci's action and policy had given the tone to the mission in China—though in fact that tone was rather inherent in the Jesuit system than the outcome of individual character, for controversies of an exactly parallel nature arose two generations later in southern India, between the Jesuits and Capuchins, regarding what were called "Malabar rites." The controversy thus kindled in China burned for considerably more than a century with great fierceness. The chief points were (1) the lawfulness and expediency of certain terms employed by the Jesuits in naming God Almighty, such as Tien, "Heaven," and Shang-di, "Supreme Ruler" or "Emperor," instead of Tien-Chu, "Lord of Heaven," and in particular the erection of inscribed tablets in the churches, on which these terms were made use of; (2) in respect to the ceremonial offerings made in honour of Confucius, and of personal ancestors, which Ricci had recognized as merely "civil" observances; (3) the erection of tablets in honour of ancestors in private houses; and (4), more generally, sanction and favour accorded to ancient Chinese sacred books and philosophical doctrine, as not really trespassing on Christian faith.

Probably no European name of past centuries is so well known in China as that of Li-ma-teu, the form in which the name of Ricci (Ricci Mai-teu) was adapted to Chinese usage, and by which he appears in Chinese records. The works which he composed in Chinese are numerous; a list of them (apparently by no means complete, however) will be found in Kircher's China Illustrata, and also in Abel Rémusat's Nouveaux Mémoires sur la Chine (pp. 106–112). They are chiefly due to Ricci, and apart from clothing ideas in a Chinese dress very rare and remarkable in a foreigner. One of the first which attracted attention and reputation among Chinese readers was De Expeditione et Missionum in Sinas (1623), a translation of the Pau Bp Estdu of Apostolicae Legationis, scriba, a P.F. Missionarius... (in the form of a dialogue between a priest and a young Chinese and a roving merchant about the nature and teaching of Christianity). The work was given great attention by the Jesuits, and a preface was written by Father Matteo de Famagosta, who had been in China several years before the time China never heard anything of the Incarnation, anything of Tien-chu, who had not become incarnate in this part of the world. Why then, if it was lawful to call God Tien before Ly-Ma-thu-Me in the Roman Church, should a name be used in China, "...Egnum de Eventu Apostolicae Legationis, scriba, a P.F. Missionarius... ad Praeossime Generalis S. J., An. 1706; 1 Novembris.

In the early part of his residence at Peking, when enjoying constant intercourse with scholars of high position, Ricci brought out the T'ien-chu shih-i, or "Veritable Doctrine of the Lord of Heaven," which deals with the divine character and attributes under eight heads. "This work," says A. Wylie, "contains some acute reasoning in support of the propositions laid down, but the doctrine of faith in Christ is very slightly touched upon. The teachings of Buddhism are vigorously attacked, whilst the author tries to draw a parallel between Christianity and the teachings of the Chinese literature." In 1604 Ricci completed the Erk-shih-sou yen, a series of short articles of moral bearing, but exhibiting little of the essential doctrines of Christianity. Chi-jen shih jen is another of his productions, completed in 1608, and consisting of a record of ten conversations held with Chinese of high position. The subjects are: (1) Years past no longer ours; (2) Matt a sojourner on earth; (3) Advantage of frequent contemplation of eternity; (4) Preparation for judgment by such contemplation; (5) The good man not desirous of talking; (6) Abstinence, and its distinction from the prohibition to take life; (7) Self-examination and self-reproof inconsistent with inaction; (8) Future reward and punishment; (9) Praying into futurity hastens calamity; (10) Wealth with covetousness more wretched than poverty with contentment. To this work is appended a translation of eight European hymns, with elucidations, written in 1609.

Some of the characteristics thus indicated may have suggested the bitterness of attacks afterwards made upon Ricci's theology. An example of these is found in the work called Anecdotes sur l'état de religion dans la Chine (Paris, 1733–35), the author of which (Abbé Villers) speaks of the T'ien-chu shih-i in this fashion: "The Jesuit was also so ill versed in the particulars of the faith that, as the holy bishop of Conon, Monsgr. Maigrot, says of him, one need merely read his book on the true religion to convince oneself that he had never imbibed the first elements of theology."...

Ricci's pointed attacks on Buddhism, and the wide circulation of his books, called forth the opposition of the Buddhist clergy. One of the ablest who took their part was Chu-huang, a priest of Hang-chow, who had abandoned the literary status for the Buddhist cloister. He wrote three articles against the doctrine of the Incarnation. These were brought to Ricci's notice in an ostensible tone of censure by Yu-chun-be, a high mandarin at the capital. This letter, with Ricci's reply, the three Buddhist declamations and Ricci's confutation, were published in a collected form by the Christian Sen-Kwang-K'e.

Another work of Ricci's which attracted attention was the Hsi-kuo ja, or "Art of Memory as practised in the West." Ricci was himself a great expert in memoria technica, and astonished the Chinese by his performances in this line. He also wrote or edited various Chinese works on geography, the celestial and terrestrial spheres, geometry and arithmetic. And the detailed history of the mission was drawn out by him, which after his death was brought home by P. Nicolas Trigault, and published at Augsburg, and later in a complete form at Lyons under the name De Expeditione Christiana apud Sinas Suspecta, ab Soc. Jesu, Ex P. Mat. Ricci ejusdem Societatis Commentarius, Trigault having added many interesting notes on China and the Chinese.

Among the scientific works which Ricci took into China was a set of maps, which at first created great interest, but afterwards disgruntled the Chinese people to perceive the insignificant place assigned to the "Middle Kingdom," thus, as it seemed, into a corner, instead of being set in the centre of the world like the gem in a ring. Ricci, seeing their dissatisfaction, set about constructing a map of the hemisphere on a great scale, so adjusted that China, with its subject states, filled the central
area, and, without deviating from truth of projection, occupied a large space in proportion to the other kingdoms gathered round it. All the names were then entered in Chinese calligraphy. This map obtained immense favour, and was immediately engraved at the expense of the viceroy and widely circulated.

In the accompanying cut we have endeavoured to portray this map. The projection adopted is a perspective of the hemisphere as viewed from a point at the distance of one diameter from the surface, and situated on the production of the radius which passes through the intersection of 115° E. long. (Greenwich) with 30° N. lat. Something near this must have been Lima-teu's projection. With a vertex much more distant the desired effect was lost, and with one nearer neither of the poles would be seen, whilst the exaggeration of China would have been too gross for a professed representation of the hemisphere.

The chief facts of Ricci's career are derived from Trigault; some contemporary works on the rites controversy have also been consulted; in the notice of Ricci's Chinese writings valuable matter has been derived from Notes on Chinese Literature by A. Wylie (London and Shanghai, 1867). A number of Ricci's letters are extant in the possession of the family, and access to them was afforded to Giuseppe La Farina, author of the work called La China, considerata nella sua storia, etc. (Florence, 1843), by the Marchese Amico Ricci of Macenata, living at Bologna. La Farina's quotations contain nothing of interest. There is a curious Chinese account of Ricci published by Dr Breit SCHNEIDER in the China Review, iv. 391 sq.

RICCIARELLI, DANIELE (1500-1566), Italian artist, generally called, from the place of his birth, DANIELE DA VOLIERA, studied painting under Sodoma and Verzucchi in Florence, and in Rome, he received abundant encouragement. His constant friend, Michelangelo, recommended him on all possible occasions, and he was commissioned to beautify with works of art a chapel in the church of the Trinità, to paint in the Farnese Palace, to execute certain decorations in the Palazzo de’ Medici at Navona, and to begin the stucco work and the pictures in the Hall of the Kings. Towards the close of his life he turned his attention to statuary. His last work was a bronze horse intended for an equestrian statue of Henry II. of France. He died in 1566. The principal extant works of Ricciarelli are at Rome. These are a “St John the Baptist” in the picture gallery of the Capitol, a “Saviour bearing the Cross” in the Palazzo Rospigliosi, and a “Descent from the Cross,” his masterpiece, in the church of Trinità de’ Monti. There is also an “Elijah” at Volterra.

RICCOBONI, MARIE JEANNE (1714-1792), whose maiden name was Laboras de Mézières, was born at Paris in 1714. She married in 1735 Antoine François Riccoboni, a comedian and dramatist, from whom she soon separated. She herself was an actress, but did not succeed on the stage. Her works are Lettres de maresse Fanny Butler (1751); Les Mémoires de l’Histoire du marquis de Cressy (1758); Mélodie Juliette Catesby {1759-1760}, like her other books, in letter form; Ernestine (1758), which La Harpe thought her masterpiece; and three series of Lettres in the names of Adelaide de Dammartin (comtesse de Sancorre) (2 vols., 1766), Elizabeth Sophie de Valilère (2 vols., 1772), and Milord Rivers (2 vols., 1776). She obtained a small pension from the crown, but the Revolution deprived her of it, and she died on the 6th of December 1792 in great indigence. Besides the works named, she wrote a novel (1762) on the subject of Fielding’s Amelia; and supplied in 1765 a continuation (but not the conclusion, sometimes erroneously ascribed to her) of Marivaux’s unfinished Marianne.

All Madame Riccoboni’s work is clever, and there is real pathos in the book. It is among the most eminent examples of the “sensibility” novel, of which no examples but Sterne’s have kept their place in England, and that not in virtue of their sensibility. A still nearer parallel may be found in the work of Mackenzie. Madame Riccoboni is an especial offender in the use of mechanical aids to impressiveness—italics, dashes, rows of points and the like. The principal editor of her complete works is that of Paris (6 vols. 1818). The chief novels appear in a volume of Garnier’s Biblio- theque (Paris, 1865). See Julia Kavanagh, French Women of Letters (2 vols., 1862), where an account of her novels is given; J. Fleury, Marivaux et le marivaudage (Paris, 1881); J. M. Quérard, La France littéraire (vol. viii., 1885); and notices by La Harpe, Grimm and Didcrot prefixed to her Oeuvres (9 vols., Paris, 1826).

RICE, EDMUND IGNATIUS (1762-1844), Irish philanthropist, founder of the “Irish Christian Brothers,” was born at Westcourt, near Callen, Kilkenny, on the 1st of June 1762. He entered the business of his uncle, an export provision merchant in Waterford, in 1779 and succeeded him in 1790. In 1796 he established an organization for visiting and relieving the poor, and in 1802 began to educate the poor children of Waterford, renting a school and supporting two teachers. In 1818 he gave a house to the 475th number of friends, bound to systematize his plans. Others, like-minded, opened schools at Dungarvan and Carrick-on-Suir. The little society numbered nine in 1808, and meeting at Waterford took religious vows from their bishop, assumed a “habit” and adopted an additional Christian name, by which, as by the collective title “Christian Brothers,” they were thenceforth known. Schools were established in Cork (1811), Dublin (1812), and Thurles and Limerick (1817). In 1820 Pope Pius VII issued a brief sanctioning the order of “Religious Brothers of the Christian Schools (Ireland),” the members of which were to be bound by vows of obedience, chastity, poverty and perseverance, and to give themselves to the free instruction, religious and literary, of male children, especially the poor. The heads of houses were to elect a superior general, and Rice held this office from 1822 to 1835, during which time the institution extended to several English towns (especially in Lancashire), and the course of instruction grew out of the primary stage. Rice died on the 26th of August 1844. The Irish Christian Brothers have some hundred houses and a little over 30,000 pupils. There are also industrial schools and orphanages, and the institute has branches in Australia, India, Gibraltar and Newfoundland.

RICE, JAMES (1842-1882), English novelist, was born at Northampton on the 26th of September 1843. Educated at Queens’ College, Cambridge, where he graduated in law in 1867, he was called to the bar at Lincoln’s Inn in 1871. In the meantime (1868) he had bought Once a Week, which proved a losing venture for him, but which brought him into touch with Walter Besant, a contributor [see Besant’s preface to the Library Edition (1887) of Ready-money Mortiboy]. There ensued a close friendship and a literary partnership between the two men which lasted ten years until Rice’s death, and resulted in a large number of successful novels. The first of them, published anonymously, Rice being responsible for the central figure and the leading situation, was Ready-money Mortiboy (1872), dramatized by them later and successfully produced at the Court Theatre in 1874. In rapid succession followed Mr Linley Gis (1873); With Harp and Crown (1874); This Son of a Saviour (1875); The Golden Butterfly (1876), the most popular of their joint productions; The Monks of Thalesma (1878); By Cela’s Arbor (1878); The Seamy Side (1880); The Chaplain of the Fleet (1881); Sir Richard Whittington (1881), and a large number of short stories, some of them reprinted in The Case of Mr Lucraft, &c. (1876); Two in Trafalgar’s Bay, &c. (1879), and The Ten Years’ Tenant, &c. (1881).

James Rice died at Redhill on the 26th of April 1882.
RICE (Greek ὀργα, Latin oryza, French riz, Italian riso, Spanish arroz, derived from the Arabic), a well-known cereal, botanical name Oryza sativa. According to Roxburgh, the great Indian botanist, the cultivated rice with all its numerous varieties has originated from a wild plant, called in India Newaree or Nivara, which is indigenous on the borders of lakes in the Circars and elsewhere in India, and is also native in tropical Australia. The rice plant is an annual grass with long linear glabrous leaves, each provided with a long sharply pointed ligule. The spikelets are borne on a compound or branched spike, erect at first but afterwards bent downwards. Each spikelet contains a solitary flower with two outer small barren glumes, above which is a large tough, compressed, often awned, flowering glume, which partly encloses the somewhat similar pale. Within these are six stamens, a hairy ovary surmounted by two feathery styles which ripen into the fruit (grain), and which is invested by the husk formed by the persistent glume and pale. The cultivated varieties are extremely numerous, some kinds being adapted for marshy land, others for growth on the hillsides. The cultivators make two principal divisions according as the sorts are early or late. Rice has been cultivated from time immemorial in tropical countries. According to Stanislas Julien a ceremonial ordinance was established in China by the emperor Chin-nung 2800 years B.C., in accordance with which the emperor sows the rice himself while the seeds of other kinds may be sown by the princes of his family. This fact, joined to other considerations, induced Alphonse de Candolle to consider rice as a native of China. It was very early cultivated in India, in some parts of which country, as in tropical Australia, it is, as we have seen, indigenous. It is not mentioned in the Bible, but its culture is alluded to in the Talmud. There is proof of its culture in the Euphrates valley and in Syria four hundred years before Christ. Crawford, on philological grounds, considers that rice was introduced into Europe from southern India. The Arabs carried the plant into Spain. Rice was first cultivated in the near Pisa in 1468. It was not introduced into S. Carolina until 1700, and then, it is said, by accident, although at one time the southern United States furnished a large proportion of the rice introduced into commerce. Rice sports into far more varieties than any of the corns familiar to Europeans; for some varieties grow in the water and some on dry land; some come to maturity in three months, while others take four and six months to do so. A very full account of the cultivation of rice in India will be found in Sir George Watt's Dictionary of the Economic Products of India.

Rice constitutes one of the most important articles of food in all tropical and subtropical countries, and is one of the most prolific of all crops. The rice yields best on low lands subject to occasional inundations, and thus enriched by alluvial deposits. An abundant rainfall during the growing season is also a desideratum. Rice is sown broadcast, and in some districts is transplanted after a fortnight or three weeks. No special rotation is followed: indeed the soil best suited for rice is ill adapted for any other crop. In some cases little manure is employed, but in others abundance of manure is used. No special tillage is required, but weeding and irrigation are requisite. Rice in the husk is known as ‘paddy.’ On cutting across a grain of rice and examining it under the microscope, first the hard easily broken outer or pericarp, and dried cellular layers and two layers of cells elongated in a direction parallel to the length of the seed, which contain the gluten or nitrogenous matter. Within these, and forming by far the largest part of the seed, are large endosperm cells filled with very numerous and very minute angular starch grains. Rice is not so valuable as a food as some other cereals, inasmuch as the proportion of nitrogenous matter (gluten) is less. Payen gives only 7% of gluten in rice as compared with 22% in the finest wheats. The 24 in one pound of ash in the ash is as 18 to 23 in wheat. The fatty matter is also less in proportion than in other cereals. Rice, therefore, is chiefly a farinaceous food, and requires to be combined with fatty and nitrogenous substances, such as milk or meat gravy, to satisfy the requirements of the system.

A large proportion of the rice brought to Europe is used for starch-making, and some is taken by distillers of alcohol. Rice is also the source of a drinking spirit in India, known as arrack, and the national beverage in Japan—and make—is prepared from the grain by means of an organic ferment.

RICE PAPER. The substance which has received this name in Europe, through the mistaken notion that it is made from rice, consists of the pith of a small tree, Aralia popoffiæra, which grows in the swampy forests of Formosa. The cylindrical core of pith is rolled on a hard flat surface against a knife, by which it is cut into thin sheets of a fine ivory-like texture. Dyed in various colours, rice paper is extensively used for the preparation of artificial flowers, while the white sheets are employed by native artists for water-colour drawings.

RICH, BARNABE (c. 1540-1617). English author and soldier, was a distant relative of Lord Chancellor Rich. He fought in the Low Countries, rising to the rank of captain, and afterwards served in Ireland. He shared in the colonization of Ulster, and spent the latter part of his life near Dublin. In the last years of his campaigns he produced many pamphlets on political questions and romances. In 1606 he was in receipt of a pension of half a crown a day, and in 1616 he was presented with a gift of £100 as being the oldest captain in the service. He died on the 10th of November 1617. His best-known work is Riches Farewell to Militarie Profession containing vertue pleasant discourses fit for a peaceable time (1581). Of the eight stories contained in it, five, he says, "are forged only for delight, neither credible to be believed, nor hurtful to be perused." The three others are translations from the Italian. He claims as his own invention the story of Aplonius and Silla, the second in the collection, from which Shakespeare took the plot of Twelfth Night. It is, however, founded on the tale of Nicula and Lattanto as told by Matteo Bandello. The eighth, Phylotus and Emilia, a complicated story arising from the likeness and disguise of a brother and sister, is identical in plot with the anonymous play, Philotus, printed in Edinburgh in 1603, and with the same country was acted by the Baynards and the Club in 1835. In the conclusion to his collection Rich tells a story of a devil named Balthasar, who possesses a king of Scots, prudently changed after the accession of James I. to the "Grand Turk," The Strange and Wonderful Adventures of Don Simonides (1581), with its sequel (1584), is written in imitation of Lyly. Among his other romances should be mentioned The Adventures of Brusane, prince of Hungary (1592). His authenticated works number twenty-four, and include works on Ireland, the troubles of which were, according to him, due to the religion of the people and to the lack of consistency and firmness on the part of the English government. Such are: Allarme to England (1578); A New Description of Ireland (1610); The Irish Hubble, or the English Hfe and Crie (1617), in which he also inveigles against the use of tobacco.

See "Introduction" to the Shakespeare Society's reprinted of Riches Farewell (1846); P. Cunningham's "Introduction" to Rich's Honesty of this Age (reprinted for the Percy Society, 1844); and the life by S. Lee in the Dictionary of National Biography.
RICH, CLAUDIUS JAMES (1787-1821), English traveller and scholar, was born near Dijon on the 28th of March 1787. His youth was spent at Bristol. He early developed a gift for languages, becoming familiar not only with Latin and Greek but also with Hebrew, Syriac, Persian, Turkish, and other Eastern tongues. In 1804 Rich went to Constantinople, where, at Smyrna, he stayed some time, perfecting himself in Turkish. Proceeding to Alexandria as assistant to the British consul-general there, he devoted himself to Arabic and its various dialects, and made himself master of Eastern manners and usages. On leaving Egypt he travelled by land to the Persian Gulf, disguised as a Mameluke, visiting Damascus, and entering the great mosque undetected. At Bombay, which he reached in September 1807, he was the guest of Sir James Mackintosh, whose eldest daughter he married in January 1808, proceeding soon after to Bagdad as resident. There he began his investigations into the geography, history and antiquities of the district. He explored the remains of Babylon, and projected a geographical and statistical account of the pashalic of Bagdad. The results of his work at Babylon appeared first in the Vienna serial *Minis de l'orient*, and in 1815 in England, under the title *Narrative of a Journey to the Site of Babylon in 1811*. In 1813-14 Rich spent some time in Europe, and on his return to Bagdad devoted himself to the study of the geography of Asia Minor, and collected much information in Syrian and Arabian convents concerning the Yezidis. During this period he made a second excursion to Bagdad, and in 1820 undertook an extensive tour to Kurdistan—from Bagdad north to Sulimania, eastward to Sinna, then west to Nineveh, and thence down the Tigris to Bagdad. The narrative of this journey, which contained the first accurate knowledge (from scientific observation) regarding the topography and geography of the region, was published by his widow under the title, *Narrative of a Residence in Koordistan and on the Site of Ancient Nineveh, &c.* (London, 1856). In 1821 Rich went to Basora, whence he made an excursion to Shiraz, visiting the ruins of Persepolis and the other remains in the neighbourhood. At Shiraz he died of cholera on the 9th of October 1821. His fine collection of manuscripts and coins was purchased by the British Museum.

RICH, JOHN (1692-1761), English actor, the "father of English pantomime," was the son of Christopher Rich (d. 1714), the manager of Drury Lane, with whose quartets and tyrannies Colley Cibber's *Apology* is much occupied. John Rich opened the new theatre in Lincoln's Inn Fields left unfinished by his father, and in 1716, under the stage name of Bun, he first appeared as Hazlequin in an unmasked entertainment, which developed into an annual pantomime (q.v.). By this departure he made successful headway in his competition with the stronger company at Drury Lane, including Cibber, Wilks and Booth. Rich was less happy in his management of Covent Garden, which he opened in 1733, until Garrick's arrival (1746), when a most prosperous season ensued, followed by a bad one when Garrick went to Dury Lane. During Rich's management the rival performances of *Romeo and Juliet*—Barry and Mrs Cibber at Covent Garden, and Garrick and Miss Bellamy at Dury Lane—and the subsequent competition between the two rival actors in *King Lear*. Rich died on the 26th of November 1761. Garrick's lines show that his acting was pantomime pure and simple, without words:

"When Lun appeared, with matchless art and whim, He gave the power of speech to every limb; Tho' masked and mute, conveyed his quick intent, And told to wearied sense the wonder he meant."

RICH, PENELope, LADY (c. 1562-1607), the Stella of Sir Philip Sidney's *Astrophel and Stella*, was the daughter of Walter Devereux, 1st Earl of Essex. She was a child of fourteen when Sir Philip Sidney accompanied the queen on a visit to Lady Essex in 1576, on her way from Kenilworth, and must have been frequently thrown into the society of Sidney, in consequence of the many ties between the two families. Essex died at Dublin in September 1576. He had sent a message to Philip Sidney from his death-bed expressing his desire that he should marry his daughter, and later his secretary wrote to the young man's father, Sir Henry Sidney, in words which seem to point to a deficiency of very definite understanding. Penelope's great-grand-nephew, Capt. Sir Anne Boleyn, and she and her brother Robert were therefore scanty connected with Elizabethe. Perhaps the marriage of Lady Essex with the earl of Leicester, which destroyed Sidney's prospects as his uncle's heir, had something to do with the breaking off of the proposed match with Penelope. Her relative and guardian, Henry Hastings, earl of Huntingdon, secured Burghley's assent in March 1581 for her marriage with Robert Rich, 3rd Baron Rich. Penelope is said to have protested in vain against the alliance with Rich, who is represented as a rough and overbearing husband. The evidence against him is, however, chiefly derived from sources as interested as Sir Philip Sidney's violent denunciation in the twenty-fourth sonnet of *Astrophel and Stella*, "Richfoles there be whose base and filthy hart." Sidney's serious love for Penelope appears to date from her marriage with Rich. The earlier sonnets are in praise of her beauty, or treat of the conventional topic of the struggle between reason and love, while the later ones are marked by unmistakable passion. The eighth sonnet of *Astrophel and Stella* narrates Stella's refusal to accept Sidney as a lover. Lady Rich was the mother of six children by her husband when she contracted in 1593 an open liaison with Philip Sidney, 8th Lord Mountjoy, a brilliant courtier and favourite of Elizabeth, whose court she had long been attached. Rich took no steps against his wife during her brother's lifetime, and she nursed him through an illness in 1600, but they obtained a legal separation in 1601, and Mountjoy acknowledged her five children born after 1595. Mountjoy was created earl of Devonshire on the accession of James I, and Lady Rich was in high favour at court. In 1605, however, they legitimized their connexion by a marriage celebrated by William Laud, the earl's chaplain. This proceeding, carried out in defiance of canon law, was followed by the disgrace of both parties, who were banished from court. Devonshire died on the 3rd of April 1606, and his wife within a year of that date. Her eldest son, Lord Rich, who became earl of Warwick in 1618, was Robert Rich, 2nd earl of Warwick (1587-1638). The second, Henry Rich, earl of Holland, was beheaded in 1649 for his share in the second Civil War. Her eldest son by Mountjoy, Mountjoy Blount, Baron Mountjoy and earl of Newport (c. 1597-1665) also figured in the Civil War.

See the editions of *Astrophel and Stella* by Dr A. B. Grosart, E. J. Johnson and W. Pollock; also the various lives of Sir Philip Sidney, and Mrs Aubrey Richardson's *Famous Ladies of the English Court* (London, 1899). John Ford's *Broken Heart* has been alleged to have been founded on the history of Lady Rich. Richard Barnard dedicated his *Affectations* (1694) to her; Bartholomew Yonge his *Diana of George of Montemayor* (1598); and several letters are addressed to her by John Davies of Hereford and by Henry Constable.

RICH, RICHARD (fl. 1610s), English soldier and adventurer, the author of *News from Virginia*, sailed from England on the 2nd of June 1609 for Virginia, with Captain Christopher Newport and the three commissioners entrusted with the foundation of the new colony. In his verse pamphlet he relates the adventures undergone by the expedition, and describes the resources of the new country, with the advantages offered to colonists. The title runs: *News from Virginia*. The lost *Flocke Triumphant*. With the happy Arrivall of that famous and worthy Knight Sr. Thomas Gates: and the well-reputed and valiant Captaine Mr Christopher Newport, and others, into England. With the manner of their distresses in the Island of Deeds (otherwise called Bermoathaves), where they remayned 32 weeks, and buildid two Pynaces, in which they returned into Virginia. By R. Rich, Gent., one of the Voyage (1610). "The only known copy of this tract is in the Hathi Library. A reprint edited by J. O. Halliwell-Phillips appeared in 1866 (and also in 1874). The adventures related by Rich are supposed to have been in Shakespeare's mind when he wrote *The Tempest*. Another tract by Rich mentioned in the Stationers' Register, *Good Speed to Virginia*, is unknown."
RICH, BARON—RICHARD OF CANTERBURY

RICH, RICHARD, 1st Baron Rich (1492?–1567), lord chancellor, was born of a Hampshire family about 1492, in the parish of St Laurence Jewry, London. His great-grandfather, Richard Rich, was a wealthy mercer and sheriff of the city of London in 1441. Probably Lord Rich's father was also a mercer, but he sent his son to the Middle Temple, where Sir Thomas More was among his acquaintances. More told him at the time of his trial that he was reputed light of his tongue, a great dicer and gamester, and not of any commendable fame; but he was a commissioner of the peace in Hertfordshire in 1528, and in the next autumn became reader at the Middle Temple. Other preferments followed, and in 1533 he was knighted and became solicitor-general, in which capacity he was to act under Thomas Cromwell as a "lesser hammer" for the demolition of the monasteries, and to secure the operation of Henry VIII.'s act of supremacy. He had an odious share in the trials of Sir Thomas More and Bishop Fisher. In both cases he made use in his evidence against the prisoner of admissions made in a professedly friendly conversation, and in More's case the words he had used were misreported and received a misconstruction that could hardly be other than wilful. More expressed his opinion of the witness in open court with a censure that might well have disdained Rich. Rich became the first chancellor (April 19, 1536) of the Court of Augmentations established for the disposal of the monastic revenues. His own share of the spoil, acquired either by grant or purchase, included Leez (Leighs) Priory and about a hundred manors in Essex. He was Speaker of the House of Commons in the same year, and advocated the king's policy. In spite of the share he had taken in the suppression of the monasteries, and of the part he was to play under Edward VI., his religious convictions remained Roman Catholic. His testimony helped the conviction of Thomas Cromwell, and he was a willing agent in the Catholic reaction which followed. Anne Askew stated that the Chancellor Wriothesley and Rich screwed the rack at her torture with their own hands.

Rich was one of the executors of the will of Henry VIII., on which so much suspicion has been thrown, and on the 26th of February 1548 he became Baron Rich of Leez. In the next month he succeeded Wriothesley as chancellor, an office in which he found full scope for the business and legal ability he undoubtedly possessed. He supported Protector Somerset in his subversive reforms in church matters, in the prosecution of his brother Lord Seymour of Sudeley, and in the rest of his policy until the crisis of his fortunes in October 1549, when he deserted to Warwick (afterwards Northumberland), and presided over the trial of his former chief. His daughter had married Warwick's son, and both men were at heart no friends to the reformed religion. Nevertheless, Rich took part in the prosecution of bishops Gardiner and Bonner, and in the harsh treatment accorded to the Princess Mary. Possibly this harshness was exaggerated, for Mary on her accession showed no ill-will to Rich. He retired from the chancellorship on the ground of ill-health in the close of 1551, at the time of the final breach between Northumberland and Somerset. He was now sixty-five years of age, and there is no reason to suspect the sincerity of his plea. There is an improbable story, however, to the effect that Rich warned Somerset of his danger in the Tower, and that the letter was delivered by mistake to the duke of Norfolk, who handed it to Northumberland.

Lord Rich took an active part in the restoration of the old religion in Essex under the new reign, and was one of the most active of persecutors. His reappearances in the privy council were rare during Mary's reign; but under Elizabeth he served on a commission to inquire into the grants of land made under Mary, and in 1566 was sent for to advise on the question of the queen's marriage. He died at Rochford, Essex, on the 12th of June 1567, and was buried in Felsted church. In Mary's reign he had founded a chantry chapel with provision for the singing of masses and dirges, and the ringing of bells in Felsted church. To this was added a Lenton allowance of herring to the inhabitants of three parishes. These donations were transferred in 1564 to the foundation of a grammar-school at Felsted for instruction, primarily for children born on the founder's manors, in Latin. Greek was not taught. The endowment of the school remained in the family of the founder until 1641. By his wife Elizabeth Jenks, or Gynkes, he had fifteen children. The eldest son Robert (1537–1581), second Baron Rich, supported the Reformation, and his grandson Robert, third lord, was created earl of Warwick in 1618.

RICHARD, ST, of Wyche (c. 1157–1253), English saint and bishop, was named after his birthplace, Droitwich in Worcestershire. Educated at Oxford, he soon began to teach in the university, of which he became chancellor, probably after he had studied in Paris and in Bologna. About 1235 he became chancellor of the diocese of Canterbury under Archbishop Edmund Rich, and he was with the archbishop during his exile in France. Having returned to England some time after Edmund's death in 1240 he became vicar of Deal and chancellor of Canterbury for the second time. In 1244 he was elected bishop of Chichester, being consecrated at Lyons by Pope Innocent IV. in March 1245, although Henry III. refused to give him the temporalities of the see, the king favouring the candidature of Robert Passelewe (d. 1252). In 1246, however, Richard obtained the temporalities. The new bishop showed much eagerness to reform the manners and morals of his clergy, and also to introduce greater order and reverence into the services of the church. His term of office was also marked by the favour which he showed to the Dominicans, a house of this order at Orleans having sheltered him during his stay in France, and by his earnestness in preaching a crusade. He died at Dover in April 1253. It was generally believed that miracles were wrought at his tomb in Chichester cathedral, which was long a popular place of pilgrimage, and in 1262 he was canonized at Viterbo by Pope Urban IV. Richard furnished the chronicler, Matthew Paris, with material for the life of Edmund Rich, and instituted the offerings for the cathedral at Chichester which were known later as "St Richard's pence.

His life by his confessor, Ralph Bocking, is published in the Acta Sanctorum of the Bollandists, where a later and shorter life by John Capgrave is also to be found.

RICHARD (d. 1184), archbishop of Canterbury, was a Norman, who became a monk at Canterbury, where he acted as chaplain to Archbishop Theobald and was a colleague of Thomas Becket. In 1173, more than two years after the murder of Becket, it was decided to fill the vacant archbishopric of Canterbury; there were two candidates, Richard, at that time prior of St Martin's, Dover, and Odo, prior of Canterbury, and in June Richard was chosen, although Odo was the nominee of the monks. Objections were raised against this election both in England and in Rome, but in April 1174 the new archbishop was consecrated at Angoulême by Pope Alexander III., and he returned to England towards the close of the year. The ten years during which Richard was archbishop were disturbed by disputes with Roger, archbishop of York, over the respective rights of the two sees, and in 1175, at a council held in London, there was a free fight between their partisans. Henry II. arranged a truce for five years between the rival prelates, but Richard was soon involved in another quarrel, this being with Roger, abbot of St Augustine's, Canterbury, whose action also trenched upon the privileges of the archbishop. Richard was more acceptable to Henry II. than Becket had been; he attended the royal councils, and more than once he was with the king in Normandy. Henry probably preferred him because he insisted less on the rights of the clergy than his great predecessor had done; but the monastic writers and the followers of Becket regarded this attitude as a sign of weakness. Richard held a council at Rochester on the 16th of February 1184 and was

**RICHARD OF CORNWALL—RICHARD I.**

**RICHARD, earl of Cornwall and king of the Romans (1209-1272),** was the second son of the English king John by Isabella of Angoulême. Born in 1209, Richard was the junior of his brother, Henry III., by fifteen months; he was educated in England and received the earldom of Cornwall in 1225. From this date to his death he was a prominent figure on the political stage. In the years 1225-27 he acted as governor of Gascony; between 1227 and 1238, owing to quarrels with his brother and dislike of the foreign favourites, he attached himself to the baronial opposition and bade fair to become a popular hero. But in 1240 he took the command of a crusade in order to escape from the troubled atmosphere of English politics. He was formally reconciled with Henry before his departure; and their amity was cemented on his return by his marriage with Sancha of Provence, the sister of Henry's queen (1243). Henceforward Richard, though by no means blind to the faults of the government, was among the most constant supporters of Henry III.

While affecting to remain neutral in the quarrels of the barons with the Poitevins and Savoyards he constantly assisted the king with loans, and thus enabled him to withstand the pressure of the troops at the previous three years. In 1257 he was elected by the German electors nominated Richard as king of the Romans, and he accepted their offer at Henry's desire. He was elected partly on account of his wealth, but also because his family connexion with the Hohenstaufen and his friendly relations with the papacy made it probable that he would unite all German parties. In the years 1257-68 Richard paid four visits to Germany. He obtained recognition in the Rhineland, which was closely connected with England by trade relations. Otherwise, however, he was unsuccessful in securing German support. In the English troubles of the same period he endeavoured to act as a mediator. On the outbreak of civil war in 1264 he took his brother's side, and his capture in a windmill outside Lewes, after the defeat of the royalist army, is commemorated in the earliest of English vernacular satires; he remained a prisoner till the fall of Montfort. But after Evesham he exerted himself, not without success, to obtain reasonable terms for those who had suffered from the violence of the royalist party. He died on the 2nd of April 1272. His end is said to have been hastened by grief for his eldest son, Henry of Almain, who had been murdered the previous year. Richard died at Viterbo. The earldom of Cornwall passed to Richard's eldest surviving son Edmund, who was guardian of England, from 1286 to 1289. On Edmund's death, in October 1300, it became extinct.

**Authorities.**—The original sources and general works of reference are the same as for the reign of Henry III. G. C. Gebauer's *Leben und Thaten Herrn Richards von Cornwall* (Leipzig, 1744), H. Koch's *Richard von Cornwall, 1209-1257* (Strassburg, 1888), and A. Bunte's *Das Doppelthal des Jahres, 1257* (Münster, 1866) are useful monographs. (H. W. C. D.)

**RICHARD I.** (1157-1199), king of England, nicknamed "Cœur de Lion" and "Yea and Nay," was the third son of Henry II. by Eleanor of Aquitaine. Born in September 1157, he received at the age of eleven the duchy of Aquitaine, and was formally installed in 1172. In his new position he was allowed, probably from regard to Aquitanian susceptibilities, to govern with an independence which was studiously denied to his brothers in their shares of the Angevin inheritance. Yet in 1173 Richard joined with the young Henry and Geoffrey of Britanny in an insurrection; Aquitaine was twice invaded by the old king before the young king could successfully resist. Richard was soon pardoned and reinstated in his duchy, where he distinguished himself by crushing a formidable revolt (1175) and exacting homage from the count of Toulouse. In a short time he was so powerful that his elder brother Henry became alarmed and demanded, as heir-apparent, that Richard should do him homage for Aquitaine. Richard having scornfully rejected the demand, a fratricidal war ensued; the young Henry invaded Aquitaine and attracted to his standard many of Richard's vassals, who were exasperated by the iron rule of the duke. Henry II. marched to Richard's aid; but the war terminated abruptly with the death of the elder prince (1183).

Richard, being now the heir to England and Normandy, was invited to renounce Aquitaine in favour of Prince John. The proposal led to a new civil war; and, although a temporary compromise was arranged, Richard soon sought the help of Philip Augustus, to whom he did homage for all the continental possessions in the actual presence of his father (Conference of Bonnouilons, 18th of November 1188). In the struggle which ensued the old king was overpowered, chased ignominiously from Le Mans to Angers, and forced to buy peace by conceding all that was demanded of him; in particular the immediate recognition of Richard as his successor.

But the death of Henry II. (1189) at once dissolved the friendship between Richard and Philip. Not only did Richard continue the continental policy of his father, but he also refused to fulfil his contract with Philip's sister, Alais, to whom he had been betrothed at the age of three. An open breach was only delayed by the desire of both kings to fulfil the crusading vows which they had recently taken. Richard, in particular, sacrificed all other interests to this scheme, and raised the necessary funds by the most reckless methods. He placed himself under the protection of the papacy, and married Isabella, daughter of Henry the Second, in 1190; and, by the help of Philip Augustus, he raised an army of 15,000 marks, the humiliating obligations which Henry II. had imposed at the treaty of Falaise. It is true that Richard indemnified himself on his return by resuming some of his most important grants and refusing to return the purchase money; but it is improbable that he had originally planned this re-pudiation of his ill-considered bargains. By such expedients he raised and equipped a force which may be estimated at 4000 men-at-arms and as many foot-soldiers, with a fleet of 700 transports (1191).

Richard did not return to his dominions until 1194. But his stay in Palestine was limited to sixteen months. On the outward journey he wintered in Sicily, where he employed himself in quarrelling with Philip and in exacting satisfaction from the usurer Tancred for the dower of his widower sister, Queen Joanna, and for his own share in the inheritance of William the Good. Leaving Messina in March 1191, he interrupted his voyage to conquer Cyprus, and only joined the Christian besiegers of Acre in June. The reduction of that stronghold was largely due to his energy and efforts. But his arms had given much offence; after the fall of Acre he inflicted a gross insult upon Leopold of Austria; and his relations with Philip were so strained that the latter seized the first pretext for returning to France, and entered into negotiations with Prince John (see John, king of England) for the partition of Richard's realm. Richard also threw himself into the disputes respecting the crown of Jerusalem, and supported Guy of Lusignan against Conrad of Montferrat with so much heat that he incurred grave, though unfounded, suspicions of complicity when Conrad was assassinated by emissaries of the Old Man of the Mountain. None the less Richard, whom even the French crusaders accepted as their leader, upheld the failing cause of the Frankish Christians with valour and tenacity. He won a brilliant victory over the forces of Saladin at Arsuf (1191), and twice led the Christian host within a few miles of Jerusalem. But the dissensions of the native Franks and the crusaders made it hopeless to continue the struggle; and Richard was alarmed by the news which reached him of John's intrigues in England and Normandy. Hastily patching up a truce with Saladin, under which the Christians kept the coast-towns and received free access to the Holy Sepulchre, Richard started on his return (26th October 1192).

His voyage was delayed by storms, and he appears to have been perplexed as to the safest route. The natural route overland through Marseilles and Toulouse was held by his enemies; that through the empire from the head of the Adriatic was little safer, since Leopold of Austria was on the watch for him. Having adopted the second of these alternatives, he was cap-
tered at Vienna in a mean disguise (December 20th, 1193) and strictly confined in the duke's castle of Dürenstein on the Danube. His mishap was soon known to England, but the regents were for some weeks uncertain of his whereabouts. This is the foundation for the tale of his discovery by the faithful minstrel Blondel, which first occurs in a French romantic chronicle of the next century. Early in 1193 Leopold surrendered his prize, under compulsion, to the emperor Henry VI, who was aggrieved both by the support which the Plantagenets had given to the family of Henry the Lion and also by Richard's recognition of Tancred in Sicily. Although the detention of a crusader was contrary to public law, Richard was compelled to purchase his release by the payment of a heavy ransom and by doing homage to the emperor for England. The ransom demanded was 150,000 marks; though it was never discharged in full, the resources of England were taxed to the utmost for the first instalments; and to this occasion we may trace the beginning of secular taxation levied on movable property.

Richard reappeared in England in March 1194; but his stay lasted only a few weeks, and the remainder of his reign was entirely devoted to his continental interests. He left England to be governed by Hubert Walter (p.7), and his personal authority was seldom asserted except by necessity. The succession of the Plantagenets was still disputed in Normandy and Aquitaine; but these provinces were unable or unwilling to pay for their own defence. Though Richard proved himself consistently the superior of Philip in the field, the difficulty of raising and paying forces to resist the French increased year by year. Richard could only stand on the defensive; the keynote of his later policy is given by the building of the famous Château Gaillard at Les Andelys (1196) to protect the lower courses of the Seine against invasion from the side of France. He did not live to see the futility of such bulwarks. In 1199 a claim to treasure-trove embroiled him with the viscount of Limoges. He harried the Limouin and laid siege to the castle of Châlus; while directing an assault he was wounded in the shoulder by a crossbow bolt, and, the wound mortifying from unskilful treatment or his own want of care, he died on the 6th of April 1199. He was buried by his own desire at his father's feet in the church of Fontevrault. Here his effigy may still be seen. Though contemporary, it does not altogether agree with the portrait on his Great Seal, which give the impression of greater strength and even of cruelty. The Fontevrault bust is no doubt idealized.

The most accomplished and versatile representative of his gifted family, Richard was, in his lifetime and long afterwards, a favourite hero with troubadours and romancers. This was natural, as he belonged to their brotherhood and himself wrote lyrics of no mean quality. But his history shows that he by no means embodied the current ideal of chivalrous excellence. His memory is stained by one act of needless cruelty, the massacre of over two thousand Saracen prisoners at Acre; and his fury, when thwarted or humbled, was unGovernable. A brave soldier, an experienced and astute general, he was never happier than when engaged in war. As a ruler he was equally profuse and rapacious. Not one useful measure can be placed to his credit; and it was by a fortunate accident that he found, in Hubert Walter, an administrator who had the skill to mitigate the consequences of a reckless fiscal policy. Richard's wife was Berengaria, daughter of Sancho VI, king of Navarre, whom he married in Cyprus in May 1191. She was with the king at Acre later in the same year; during his imprisonment passed her time in Sicily, Rome and in France. Husband and wife met again in 1195, and the queen long survived the king, residing chiefly at Le Mans. She died soon after 1230. Berengaria founded a Cisterian monastery at Espau.

AUTHORITIES.—The most important of the general chronicles are: the Gesta Henrici Secundi, ascribed to Benedict of Peterborough (Rolls Series, 2 vols., 1867); the Chronica of Roger of Hoveden (Rolls Series, 4 vols., 1868—71); the Chronica of Gervase of Canterbury (Rolls Series, 1879); the Imagines Historiarum of Ralph of Coggeshall (Rolls Series, 1875); the Flores Historiarum of Roger of Wendover (Rolls Series, 3 vols., 1886—87); the Gesta Philippi Augusti of Rigord (Société de l'histoire de France, Paris, 1885) and of Guillaume de Machaut (Paris, 1887). Van Reenen has given in L'Esioire de la guerre sainte, a rhyming French chronic by the minstrel Ambroise (ed. Gaston Paris, 1897), and in the Latin prose version known as the Itinerarium O. Peregrinorum et gesta Regis Ricardi; this last, with some valuable historical letters, is printed in W. Stubbs's Chronicles and Memorials of the Reign of Richard I. (Rolls Series, 2 vols., 1864—65). Of modern works the following are useful: W. Stubbs's preface to vols. iii. and iv. of H chronic; the same author's Constitutional History of England, vol. i. (Oxford, 1897); Miss K. Norgate's England under the Angevin Kings, vol. ii. (London, 1887); Sir J. H. Ramsay's Angevin Empire (London, 1903); R. Rührstiecht. Geschichte des Königreichs Jerusalem (1898); W. B. Stevenson's Crusaders in the East (Cambridge, 1907); A. Cartellieri's Philipp II. August (Leipzig, 1899).

RICHARD II. (1367—1400), king of England, younger son of Edward the Black Prince by Joan "the Fair Maid of Kent," was born at Bordeaux on the 6th of January 1367. He was brought to England in 1371, and after his father's death was, on the petition of the Commons in parliament, created prince of Wales on the 20th of November 1376. When Edward III. died, on the 21st of June 1377, Richard became king. Popular opinion had credited John of Gaunt with designs on the throne. This was not justified; nevertheless, the rivalry of the boy-king's uncles added another to the troubles due to the war, the Black Death and the prospect of a long minority. At first the government was conducted by a council appointed by parliament. The council was honest, but the difficulties of the situation were too great. The ill-considered poll-tax of 1381 was the occasion, though the real cause, of the Peasants' Revolt. The ministry of Owen Mortimer was quite unequal to the crisis, and when Wat Tyler and his followers got possession of London, it was Richard who showed a precocious tact and confidence in handling it. It was the boy-king who met and temporized with the rebels on the 13th of June at Mile End, and again next day at Smithfield; and he who, with courageous presence of mind, saved the situation when Tyler was killed, by calling on them to take him for their leader. From this time Richard began to assert himself. His chief ministers, appointed by parliament in 1382, were the earl of Arundel and Michael de la Pole. Arundel Richard disliked, and dismissed next year, when he began his personal government. Pole, whom he retained as chancellor and made earl of Suffolk, was a well-chosen adviser. But others, and especially his youthful favourite Robert de Vere, promoted by unheard-of honour to be marquess of Dublin and duke of Ireland, were less worthy. Further, Richard made his own position difficult by lavish extravagance and unseemly outbursts of temper. He chafed under the restraint of his relatives, and therefore encouraged John of Gaunt in his Spanish enterprise. This gave the less scrupulous Thomas of Lancaster an opportunity. Gloucester supported by Arundel, attacked his nephew's ministers in the parliament of 1386, and by open hints at deposition forced Richard to submit to a council of control. When Richard, with the aid of his friends and by the advice of subservient judges, planned a reversal of the parliament, Gloucester, at the head of the so-called lords appellant, anticipated him. Richard had been premature and ill-advised. Gloucester had the advantage of posing as the head of the constitutional party. The king's friends were driven into exile or executed, and he himself forced to submit to the loss of all real power (May 1388). Richard changed his
methods, and when the lords appellant had lost credit, asserted himself constitutionally by dismissing Gloucester’s supporters from office, and appointing in their place well-approved men like William of Wykeham. In the next parliament of 1390 the king showed himself ready to meet and consiliate his subjects. The simultaneous return of John of Gaunt from Spain put a check on Gloucester’s ambition. For seven years Richard ruled constitutionally and on the whole well. The opposition was quiescent except for two outbreaks by Arundel: the first was a violent attack on John of Gaunt, which rather strengthened Richard’s position; the second was a wanton insult to the king at the funeral of his queen.

In January 1383 Richard had married Anne of Bohemia (1366–1394), daughter of the emperor Charles IV. The marriage, though childless, was happy; had Anne lived or borne a son the course of events might have been different. Her death on the 7th of June 1394 was a great shock to Richard, and incidentally had important consequences. Richard sought distraction by an expedition to Ireland, the first visit of an English king for more than two centuries. In his policy there he showed a wise statesmanship. At the same time he was negotiating for a permanent peace with France, which was finally signed in 1389; it was a peace with Isabel, daughter of Charles VI., a child of seven. Gloucester criticized the peace openly, and there was some show of opposition in the parliament of February 1397. But there was nothing to foreshadow the sudden stroke by which in July Richard arrested Gloucester and his chief supporters, the earls of Arundel and Warwick. The others of the five lords apppellant, Henry of Bolingbroke afterwards King Henry IV., and the earl of Nottingham, now supported the king. Richard’s action was apparently in deliberate revenge for the events of 1387–88. Gloucester, after a forced confession, died in prison at Calais, smothered by his nephew’s orders. Arundel in a packed parliament was condemned and executed; his brother Thomas archbishop of Canterbury was exiled. The king’s friends, including Nottingham and Bolingbroke, made dukes of Norfolk and Hereford, were all promoted in title and estate. Richard himself was rewarded for ten years’ patience by the possession of absolute power. He might perhaps have established it if he could have exercised it with moderation. But he declared that the laws of England were in his mouth, and supported his support of them by a variety of tactics. By the exile of Norfolk and Hereford in September 1398 he seemed to have removed the last persons he need fear. He was so confident that in May 1399 he paid a second visit to Ireland, taking with him all his most trusted adherents. Thus when Henry landed at Ravenspur in July he found only half-hearted opposition, and when Richard himself returned it was too late. Ultimately Richard surrendered to Henry at Flint on the 10th of August, promising to abdicate if his life was spared. He was taken to London riding behind his rival with indignity. On the 30th of September he signed in the Tower a deed of abdication, wherein he owned himself insufficient and useless, reading it first aloud with a cheerful men and ending with a request that his cousin would be good lord to him. The parliament ordered that Richard should be kept close prisoner, and he was sent secretly to Pontefract. There in February 1400 he died: no doubt of the rigour of his winter imprisonment, rather than by actual murder as alleged in the story adopted by Shakespeare. The mystery of Richard’s death led to rumour and exaggeration, and an impostor pretending to be Richard lived during many years under the protection of the Scottish government. But no doubt it was the real Richard who was buried without state in 1400 at King’s Langley, and honourably reinterred by Henry V. at Westminster in 1413.

Richard II. is a character of strange contradictions. It is difficult to reconcile the precocious boy of 1381 with the wayward and passionate youth of the next few years. Even if it be supposed that he dissembled his real opinions during the period of his constitutional rule, it is impossible to believe that the apparent indifferance which he showed in his fall was the mere acting of a part. His violent outbursts of passion perhaps give the best clue to a mercurial and impulsive nature, easily elated and depressed. He had real ability, and in his Irish policy, and in the preference which he showed to his own continental adventure, showed a statesmanship in advance of his time. But this, in spite of his lofty theory of kingship, makes it the more difficult to explain his extravagant bearing in his prosperity. His fall was due to the triumph of national right over absolute government, but it was his personal conduct which made it inevitable. In appearance Richard was tall and handsome, if effeminate. He had some literary tastes, which were shown in fitful patronage of Chaucer, Gower and Froissart. His fancy for splendid dress may have been due to an artistic sense, which found better expression in his great buildings of Westminster Hall and Abbey. Richard’s second queen, Isabella (1389–1409), was born in Paris on the 9th of November 1389, and was married to the English king at Calais in October, or November 1396, but on account of the bride’s youth the marriage was never consummated. When Richard lost his crown in 1399 Isabella was captured by Henry IV.’s partisans and sent to Sonning, near Reading, while her father, Charles III., asked in vain for the restoration of his daughter and her property. In 1404 she was allowed to return to France; in 1406 she became the wife of Philip, Duke of Orleans, and she died on the 13th of September 1409.

BIBLIOGRAPHY.—The best contemporary authorities are the Chronicon Anglica down to 1388, Walsingham’s Historia Anglica, the Annales Ricardi II., Knighton’s Cronicle (all these in the Rolls Series), the Vita Ricardi II. by a monk of Evesham (ed. T. Hearne), and the Chronique de la raison et mort (English Hist. Soc.). Froissart wrote from some personal knowledge. A metrical account of Richard’s fall, probably written by a French knight called Creton, is printed in Archaeologia, xx. The chief collections of documents are the Rolls of Parliament and the Calendar of Patent Rolls, H. A. Wallon’s Richard II. (Paris, 1864) is the fullest, though now somewhat out of date. For other modern accounts see W. Stubbs, Constitutional History, and C. W. C. Oman, The Political History of England, vol. iv., and The Great Revolt of 1381. (C. L. K.)

RICHARD III. (1452–1483), king of England, youngest son of Richard, duke of York, by Cicely Neville, was born at Fotheringhay on the 2nd of October 1452. After the second battle of St Albans in February 1461, his mother sent him with his brother George for safety to Utrecht. They returned in April, and at the coronation of Edward IV. Richard was created duke of Gloucester. As a mere child he had no importance till 1469–71, when he went with his brother against Warwick, shared his exile and took part in his triumphant return. He distinguished himself at Barnet and Tewkesbury; according to the contemporary chronicle, the latter battle he murdered the young Edward of Wales in cold blood; this is discredited by the authority of Warkworth (Chronicle, p. 188). But Richard may have had a share in Edward’s death during the fighting. He cannot be so fully cleared of complicity in the murder of Henry VI., which probably took place at the Tower on the night of the 21–22 of May, when Richard was certainly present there. Richard shared to the full in his brother’s prosperity. He had large grants of lands and office, and by marrying Anne (1456–1483), the younger daughter of Warwick, secured a share in the Neville inheritance. This was distasteful to George, Duke of Clarence, who was already married to the elder sister, Isabel. The rivalry of the two brothers caused a quarrel which was never appeased. Richard does not, however, seem to have been directly responsible for the death of Clarence in 1478; Sir Thomas More, who is a hostile witness, says that he resisted it openly “how- ever somewhat (as men deemed) more faintly than he that were heartily minded to it.” Richard’s share of the Neville inheritance was chiefly in the north, and he resided usually at Middleham in Yorkshire. In May 1480 he was made the king’s lieutenant-general in the north, and in 1482 commanded a successful invasion of Scotland. His administration was good, and brought him well-deserved popularity. On Edward’s death he was kept informed of events in London by William, Lord Hastings, who shared his dislike of the Woodville influence.
RICHARD, F. M. B.—RICHARD OF CIRENCESTER

On the 29th of April 1483, supported by the duke of Buckingham, he intercepted his nephew at Stony Stratford and arrested Lord Rivers and Richard Grey, the little king's half-brother. It was in Richard's charge that Edward was brought to London on the 4th of May. Richard was recognized as protector, the Woodville faction was overthrown, and the queen with her younger children took sanctuary at Westminster. For a time the government was carried on in Edward's name, and the 22nd of June was appointed for his coronation. Richard was nevertheless gathering forces and consulting with his friends. In the council there was a party of whom Hastings and Bishop Morton were the chief, which was loyal to the boy-king. On the 13th of June came the famous scene when Richard appeared suddenly in the council baring his withered arm and accusing Jane Shore and the queen of sorcery; Hastings, Morton and Stanley were arrested and the first-named at once beheaded. A few days later, probably on the 27th of June, Rivers and Grey were executed at Pontefract. On the 22nd of June Dr Shaw was put up to preach at Paul's Cross against the legitimacy of the children of Edward IV. On the 25th a sort of parliament was convened at which Edward's marriage was declared invalid on the ground of his precontract with Eleanor Talbot, and Richard rightful king. Richard, who was not present, accepted the crown with feigned reluctance, and from the following day began his formal reign.

On the 6th of July Richard was crowned at Westminster, and immediately afterwards made a royal progress through the Midlands, on which he was well received. But in spite of its apparent success the usurpation was not popular. Richard's position could not be secure whilst his nephews lived. There seems to be no reasonable doubt that early in August Edward V. and his brother Richard (whom Elizabeth Woodville had been forced to surrender) were murdered by their uncle's orders in the Tower. Attempts have been made to clear Richard's memory. But the report of the princes' death was believed in England "for Richard was the king beloved of the hearts of the people" (Chronicles of London, 1907), and it was referred to as a definite fact before the French states-general in January 1484. The general, if vague, dissatisfaction found its expression in Buckingham's rebellion. Richard, however, was fortunate, and the movement collapsed. He met his only parliament in January 1484 with some show of triumph, and deserves credit for the wise intent of its legislation. He could not, however, stay the undercurrent of disaffection, and his ministers, Lovell and Catesby, were unpopular. His position was weakened by the death of his only legitimate son in April 1484. His queen died also a year later (March 16, 1485), and public opinion was scandalized by the rumour that Richard intended to marry his own niece, Elizabeth of York. Thus the feeling in favour of his rival Henry Tudor strengthened. Henry landed at Milford Haven on the 7th of August 1485, and it was with dark forebodings that Richard met him at Bosworth on the 22nd. The defeat of Richard and his forces at Bosworth Field was a victory for Richard was killed fighting, courageous at all events. After the battle his body was carried to Leicester, trussed across a horse's back, and buried without honour in the church of the Greyfriars.

Richard was not the villain that his enemies depicted. He had good qualities, both as a man and a ruler, and showed a sound judgment of political needs. Still it is impossible to acquit him of the crime, the popular belief in which was the chief cause of his ruin. He was not a monster; but a typical man in an age of strange contradictions of character, of culture combined with cruelty, and of an emotional temper that was capable of high ends, though unscrupulous of means. Tradition represents Richard as deformed. It seems clear that he had some physical defect, though not so great as has been alleged. John Stow told Buck that old men who remembered Richard described him as in bodily form comely enough. Extant portraits help to show an intellectual face characteristic of the early Renaissance, but do not indicate any deformity.

BIBLIOGRAPHY.—The chief original authorities are Sir Thomas More's History of Richard III., based on information supplied by Archbishop Morton, and therefore to be accepted with caution; the more trustworthy Continuation of the Croyland Chronicle in Fulman's Scrip- tores, the History of Polydore Vergil, written in a Tudor spirit; the Chronicle of London (ed. C. L. Kingsford, 1905), and its biased expansion in Fabian's Chronicle. See also Letters and Papers Illustrative of the Reigns of Richard III., ed. Henry VII., ed. J. Gairdner, in Rolls Series. Of later accounts those in Stone's Memorials (preserving some oral tradition) and George Buck's Richard III., ap. Kennet History of England deserve mention. Horace Walpole attempted a vindication in his Historic Doubts (1768). The best modern account is W. R. Lunt's Life of Richard III. (ed., 1898). The latest and fullest defence is given in Sir Clements Markham's Richard III., His Life and Character (1906); G. B. Churchill's Richard the Third up to Shakespeare (Palaestra E., 1900) and a valuable digest of the subject (Oxford, 1915).

RICHARD, FRANÇOIS MARIE BENJAMIN (1819-1908), archbishop of Paris, French prelate, was born at Nantes on the 1st of March 1819. Educated at the seminary of St Sulpice he became successively vicar-general of Nantes, bishop of Belley, and in 1875 coadjutor of Paris. In 1886 the death of Archbishop Guibert was followed by Mgr. Richard's appointment to the see of Paris, and in 1889 he received a cardinal's hat. In January 1900 the trial of the Assumptionist Fathers resulted in the dissolution of their society as an illegal association. Next day an official visit of the archbishop to the Fathers was noted by government as an act of a political character, and Mgr. Richard was officially censured. His action was in general exceedingly moderate, he had no share in the extremist policy of the Ultramontanes, and throughout the struggle over the law of Associations and the law of Separations he maintained his reasonable temper. He presided in September 1906 over an assembly of bishops and archbishops at his palace in the rue de Grenelle, a few days after the papal encyclical forbidding French Catholics to form associations for public worship, but it was then too late for conciliation. In December he gave up the archiepiscopal palace to the government authorities. He was then an old man of nearly ninety, and his "eviction" evoked great sympathy. Cardinal Richard died on the 29th of January 1908.

RICHARD, HENRY (1812-1888), Welsh politician, was the son of the Rev. Ebenezer Richard (1781-1837), a Calvinistic Methodist minister, and was born on the 3rd of April 1812. Educated at Llangatock grammar school, he also studied at a college at Highbury, and in 1835 became minister of a Congregational church in the Old Kent Road, London, a position which he retained for fifteen years. Richard is chiefly known as an advocate of peace and international arbitration. In 1865 he became secretary of the Peace Society, and in this capacity he helped to organize a series of congresses in the capitals of Europe, and was partly instrumental in securing the insertion of a declaration in favour of arbitration in the treaty of Paris in 1866. He resigned this post in 1885. In 1869 Richard was elected member of parliament for the Merthyr boroughs, and he remained in the House of Commons until his death at Treborth, near Bangor, on the 20th of August 1888. In parliament he was a leading member of the party which advocated the removal of Nonconformist grievances and the disestablishment of the church in Wales; in 1877 he was chairman of the Congregational Union of England and Wales. Among Richard's writings may be mentioned: Defensive War (1864, and again 1890); Memoirs of Joseph Sturge (1864); Letters on the Social and Political Condition of the Principality of Wales (1866, and again 1884); and The Recent Progress of International Arbitration (1884). He also prepared some of the material for the life of his friend and associate, Richard Cobden, which was written by Mr John, now Lord, Morley; and he did some journalistic work in the Morning Star and the Evening Star.

See C. S. Miall, Henry Richard, M.P. (1889); L. Appleton, Memoirs of Henry Richard (1889); and articles in Cymru Fudd for 1888.

RICHARD OF CIRENCESTER (c. 1335-c. 1401), historical writer, was a member of the Benedictine abbey at Westminster, and his name ("Cirecst") first appears on the chamberlain's list of the monks of that foundation drawn up in the year 1355. In the year 1391 he obtained a licence from the abbot to go to Rome, and in this the abbot gives his testimony to Richard's
perfect and sincere observance of religion for upwards of thirty years. In 1400 Richard was in the infancy of the abbey, which he died in the following year. His only known extant work is *Speculum Historiale de Gestis Regum Angliae*, 447-1066. The MS. of this is in the university library at Cambridge, and has been edited for the Rolls Series (No. 30) by Professor J. E. B. Mayor (2 vols., London, 1863–69). It is in four books, and at the conclusion of the fourth book Richard expresses his intention of continuing his narrative from the accession of William I., and incorporating a sketch of the Conqueror's career from his birth. This design he does not, however, appear to have carried into effect. The value of the *Speculum* as a contribution to our historical knowledge is but slight, for it is mainly a compilation from other writers; while even in transcribing these the compiler is guilty of great carelessness. He gives, however, numerous charters relating to Westminster Abbey, and also a very complete account of the saints whose tombs were in the abbey church, and especially of Edward the Confessor.

The work was, however, largely used by historians and antiquaries, until, with the rise of a more critical spirit, its value has been more justly estimated. Besides the *Speculum* Richard also wrote, according to the statement of William of Woodforde in his *Answer* to Wyeciffe (Edward Brown, *Fasciculus Rerum expetendarum*, p. 193), a treatise *De Officiis*; and there was formerly in the cathedral library at Peterborough another tractate from his pen, entitled *Super Symbolum*. Of neither of these works, however, does any known copy now exist.

The *Speculum* affords the most conclusive proof of the spuriousness of another work attributed to Richard and long accepted by the learned world as his. This was the *De Situ Britanniae*, an elaborate forgery, designed to the advantage of Richard of Devizes, which first appeared at Copenhagen in the year 1747. It was printed with the works of Gildas and Nennius, under the editorship of Charles Julius Bertram, professor of English in the academy of Copenhagen; and in the middle of the 18th century, with the following special title: "Richardi Corinensis monachi Westmonasteriensis de situ Britanniae libri duo. E. Codici MS. descriptis, Notisque et Indice adornavit Carolus Bertram.

This forgery was accepted as genuine by a well-known antiquary of the 18th century, Dr William Stukeley, and under the sanction of his authority continued for a long time to be regarded in the same light by numerous scholars and antiquaries, including Gibbon and Murray. The compiler has here had the credit of a new, and, as he has expressed, a laudatory, expression, on various grounds, to a contrary conclusion. All doubt on the subject may, however, be held to have been effectively set at rest by the masterly exposure of the whole fraud drawn up by Professor Howlett, in a work entitled, *De Officiis*. Above all the parts of the *Speculum*, he has there not only demonstrated, from the external and internal evidence alike, the spuriousness of the whole tractate, but in a collation (extending to nearly a hundred pages) of numerous passages with corresponding passages in classical mediaeval authorities, has also traced out the various sources whence Bertram derived the terminology and the facts which he reproduced in the *De Situ*.

**RICHARD OF DEVIZES—RICHARD OF ST VICTOR**

**RICHARD OF DEVIZES** (fl. 1191), English chronicle, was a monk of St Swithin's house at Winchester. His birthplace is probably indicated by his surname, but of his life we know nothing. He is credited by Bale with the composition of the *Annales de Wintonia*, which are edited by Luard in the second volume of the *Annales Monastici*. If this statement be correct, then the chronicler survived King Richard I. But the *Chronicon de rebus gestis Ricardi Primi* of Devizes is chiefly known, only covers the first three years of that king's reign; it is practically an account of events in England and the Holy Land during the Third Crusade. For the events of the crusade itself, Richard is a poor authority. But his account of the preparations for the crusade, and of English affairs in the king's absence, is valuable, in spite of some inaccuracies. The author is intensely conservative, steeped in the prejudices of his order, and particularly hostile to the Jews and to the chancellor, William Longchamp. He writes in a vivid and epigrammatic style; his Latin shows the effect of the 12th-century Renaissance in its polish and in its reminiscences of classical poets.

**RICHARD OF HEXHAM** (fl. 1141), English chronicler, became prior of Hexham about 1141, and died between 1163 and 1178. He wrote *Brevis Annotation*, a short history of the church of Hexham from 674 to 1138, for which he borrowed from Bede, Eddius and Simeon of Durham. This is published by J. Raine in *The Priory of Hexham*, its Chroniclers, Endowments and Annals (Durham, 1864–65). More important is his *Historia de gestis regis Stephani et de bello Standardii*, very valuable for the history of the north of England during the earlier part of the reign of Stephen, and especially for the battle of the Standard. This history, which is a contemporary one, covers the period from the death of Henry I. in 1135 to early in 1139. It has been edited for the Rolls Series by R. Howlett in the *Chronicles of the Reigns of Stephen, Henry II. and Richard I.*, vol. iii. (1886); and has been translated by J. Stevenson in the *Church Historians of England*, vol. iv. (1856).

**RICHARD OF ILCHESTER** (d. 1188), English statesman and prelate, was born in the diocese of Bath, where he obtained preferment. Early in the reign of Henry II., however, he is found acting as a clerk in the king's court, probably under Thomas Becket, and he was one of the officials who assisted Henry in carrying out his great judicial and financial reforms. In 1162, or 1163, he was appointed archdeacon of Poitiers, but he passed most of his time in England, although in the next two or three years he visited Pope Alexander III. and the Emperor Frederick I. in the interests of the English king, who was then engaged in his struggle with Becket. For promising to support Frederick against Alexander he was excommunicated by Becket in 1166. Before this event, however, Richard had been appointed a baron of the exchequer, his great industry and exceptional abilities as an accountant being recognized by giving him a special seat at the exchequer table, and from 1168 until his death he frequently acted as one of the itinerant justices. Although totally immersed in secular business he was also several times a member of the University, and in May 1173 he was elected bishop of Winchester, being consecrated at Canterbury in October 1174. Richard still continued to serve Henry II. In 1176 he was appointed justiciar and seneschal of Normandy, and was given full control of all the royal business in the duchy. He died on the 21st or 22nd of December 1188, and was buried in Winchester cathedral. Richard owes his surname to the fact that Henry II. granted him a mill at Ilchester; he is also called Richard of Toclyve.

**RICHARD OF ST VICTOR** (d. 1173), theologian and mystic of the 12th century. Very little is known of his life; he was born in Scotland or in England, and went to Paris, where he entered the abbey of St Victor and was a pupil of the great mystic, Hugh of St Victor. He succeeded as prior of this house in 1162, and was continuously contesting the tyrannical authority of the abbot Ersilia. His writings, some of which are still in manuscript, are very numerous, the best known being his mystical treatises: *De statu hominis interioris*, *De praeparatione animi ad contemplationem*, *De gratia contemplationis*, *De gradibus caritatis*, *De orca nuptiae*, and his two works on the Trinity: *De trinitate libri sex*, *De tribus approprias personis in Trinitate*. As is the case with all the Victorines, his mysticism was a reaction against the philosophy of the schools of his time, a perpetual justification of contemplation as opposed to logical reasoning. According to him, six steps lead the soul to contemplation: (1) contemplation of visible and tangible objects; (2) study of the productions of nature and of art; (3) study of character; (4) study of souls and of spirits; (5) entrance to the mystical region which ends in (6) ecstasy. His theory of the Trinity is chiefly based on the arguments of Anselm of Canterbury, although a certain deification of the social sense is evident.
His style is most affected, and the influence of the neo-Platonic terminology as well as of the works of the pseudo-Dionysius can be clearly detected. In the Paradiso, Dante has placed Richard de St Victor, whose books were much read by his contemporaries, among the greatest teachers of the Church. His writings seem to have come into favour again in the 16th and 17th centuries, six editions of his works having been printed between 1506 and 1650.

**RICHARDIA**, a small genus of the nat. ord. Araceae, native in South Africa, to which the "arum lily" belongs. They are all greenhouse herbaceous plants of handsome appearance, with thick underground stems and large, more or less fleshy, long-stalked, arrow-shaped leaves and white or yellow flowers. They are readily propagated by division of the shoot, also by seed. Water should be given abundantly at all times, and the soil for potting should be rich and retentive. POTTING is best effected in spring, and from the beginning of June to the end of August they may be placed in a sunny spot out of doors. They will not withstand frost, and should be wintered in a warm greenhouse. They flower throughout the year.

**RICHARDS, ALFRED BATE** (1820–1876), English journalist, was born in Worcestershire on the 17th of February 1820, and was educated at Westminster School and Exeter College, Oxford. After taking his degree in 1841 he published, anonymously, *Oxford Unmasked*, a denunciation of abuses in the university. Between 1845 and 1848 he wrote several dramas and some poetry, and in the latter year became editor of a weekly newspaper, the *British Army Despatch*. His temperament was strongly Imperialist; he opposed Cobden and the Manchester school of politicians, and in a volume entitled *Britain Redeemed and Canada Preserved* predicted, thirty years before the event, the construction of the Canadian Pacific railway. In 1855 he was appointed the first editor of the London *Daily Telegraph*, and through the medium of that journal strongly urged the formation of a volunteer rifle corps. The National and Constitutional Defence Society was established in 1858 to carry out the idea. Richards himself raised a regiment of a thousand working men in London, becoming major and subsequently colonel of the corps. In 1870 he was appointed editor of the London *Morning Advertiser*, and retained this position till his death on the 12th of June 1876.

**RICHARDS, HENRY BRINLEY** (1819–1862), English pianist and composer, was born at Carmarthen, and educated at the Royal Academy of Music in London, where later he was a professor. He took much interest in Welsh music and in the Eisteddfod gatherings. He was a prolific composer, but perhaps principally remembered for writing the song "God bless the Prince of Wales" (1862), which has been adopted as an English national anthem.

**RICHARDS, WILLIAM TROST** (1833–1903), American marine painter, was born at Philadelphia, Pennsylvania, on the 14th of November 1833. He was a pupil of Paul Weber in his native city, and lived much in France, being a member of the Pennsylvania Academy of the Fine Arts, and of the American Water Colour Society. Examples of his work are in the collections of the Pennsylvania Academy of the Fine Arts, Philadelphia, Penn.; the Metropolitan Museum of Art, New York, the Corcoran Art Gallery, Washington, D.C., and the Schaeube Gallery, Hamburg. He died at Newport, Rhode Island, on the 8th of November 1905. His daughter ANNA M. RICHARDS (b. 1870), figure and landscape painter, was a pupil of John La Farge and Benjamin Constant.

**RICHARDSON, GEORGE**, English 18th-century architect and designer. The dates of birth and death of this distinguished contemporary and rival of the brothers Adam are not ascertained, but he is conjectured to have been born about 1736 and to have died in 1817. Richardson spent three years—from 1760 to 1763—travelling in Dalmatia and Istria, in the south of France and in Italy. During that period he imbibed the inspiration of a lifetime, and acquired the material for its practical application. He soon began to show remarkable skill in adapting classical ideals to the uses of his time, and in 1765 he won a premium offered by the Society of Arts for a design of a street in the classical manner. Richardson's work is so closely allied to that of the brothers Adam that it is often difficult to distinguish between them, and if it possessed less freedom and variety, and bore to a smaller extent the impress of an original mind, it was in the main exceedingly admirable and satisfying. Richardson was an especially successful designer of ceilings and chimney-pieces. He published in 1776 a *Book of Ceilings in the Style of the Antique Grotesse*. Many of its drawings are of exquisite taste. Nor is his fireplace work, as represented by his *Collection of Chimney-pieces Ornamented in the Style of the Etruscan, Greek and Roman Architecture* (1781), less attractive. Richardson's chimney-pieces are still to be found in considerable numbers in town and country houses. They are mostly of marble, but examples in wood are also common. He made extensive use of coloured marbles, and the effect is constantly that of the sumptuous balancing the austerity. Like the Adams, Richardson often worked with composition enrichments, and his *New Designs in Architecture* (1792) contains many drawings of interior firexes and columns to be executed either in this medium or painted to suit the wall hangings. His versatility was considerable, as the titles of his works, a dozen in number, suggest. For many years he exhibited at the Royal Academy as well as in the Galleries of the Society of Arts. Why such a man should have fallen into penury in his old age we have no means of ascertaining, but we know that his necessities were relieved by Nollekens.

His principal works in addition to those already mentioned were, in chronological order: *Aedes Pembrocianae* (1774); *Iconomy* (2 vols.), with plates by Bartolozzi and other engravers (1778–1779); *New Designs in Architecture* (1792); *Original Designs for Country Seats or Villas* (1795); *The New Vitruvius Britannicus*, a sequel to Colin Campbell's *Vitruvius Britannicus*, 2 vols. (1802); *Ornaments in the Greek, Roman and Etruscan Tastes* (1816). He also published volumes analing with wallpapers, woodcuts, antique firexes and other architectural and decorative details.

**RICHARDSON, HENRY HOBSON** (1838–1886), American architect, was born in the parish of St. James, Louisiana, on the 29th of September 1838, of a rich family, his mother being a granddaughter of the famous Dr. Priestley, the English dissenting refugee and man of science. He graduated from Harvard University in 1859, and going immediately to Paris to study architecture, entered the École des Beaux-Arts. The Civil War, which broke out in the United States while he was in the school, prevented his return to Louisiana, and stripped his family of their possessions, so that Richardson provided for his own support by working in the offices of practising architects in Paris, till the fall of 1865. Coming back, he established himself in New York, where he soon made his way into practice as an architect. In 1858 he moved to Boston, where he passed the remaining years of his life, designing there most of the work that made his reputation. He had married Miss Julia Gates, of Harvard, in 1867; they were married in Boston; he died on the 27th of April 1886, not yet forty-eight years old.

Richardson's career was short, and the number of his works was small indeed compared with the attention they attracted and the influence he left behind him. The most important and characteristic are: Trinity church and the so-called Brattle Square church, in Boston; the alterations in the State Capitol at Albany; the county buildings at Pittsburg; town halls at Albany, Springfield and North Easton; town libraries at Woburn, North Easton, Quincy, Burlington and Malden; Sever Hall and Austin Hall at Harvard University; the Chamber of Commerce at Cincinnati. Trinity church, the Pittsburg buildings and the Capitol at Albany were works of great importance, which have had a strong influence on men
who followed him and brought him wide acknowledgment. It is notable that American architects who have studied in Europe, especially in Paris, are apt to drift either into a pathless eclecticism or into the English current. Richardson did neither. The Romanesque that he saw in Europe, especially in the middle and south of France, appealed so strongly to his sense for mass and broad picturesque ness that he soon followed its leading, away from the style he had learned in Paris. His earliest work was modern French in style; his first church, in Springfield, a startlingly independent version of English Gothic. Yet half a dozen buildings made the transition to that derivative of Romanesque to which afterwards in all his buildings he steadfastly adhered. In Trinity church, his first monumental work, perhaps his finest, he broke away absolutely from the prevailing English Gothic fashion. Instead of the long Latin cross with aisles and transepts, he made a wide cross almost Greek in plan, with short arms fifty feet broad and aisles that are only passages, a narthex flanked by two western towers, a nave of one double bay, an eastern arm prolonged into a great apse of the full width of the crossing, over which sits a massive square tower. The arms of the church are barrel-vaulted in wood; under the great tower is a flat covered ceiling a hundred feet above the floor. This style, which shows most clearly the contrast to the churches in Auvergne, which have furnished the material for the design of the apse. The central tower is a reminiscence of the noble lantern of the old cathedral of Salamanca, but the square outline is insisted on instead of the polygonal, and the forms are in other ways much changed. The alteration of the Capitol at Albany, half a dozen years later, shared with Leopold Eidlitz, was a compromise in style, and so lacks the sure handling of his best work, except in that part of the interior in which he was untramelled, the Senate Chamber and the great staircase. In the buildings at Pittsburg, on the other hand, he was free from interference, and these satisfied him more than any other of his buildings. His great design for the new cathedral at Albany, an adaptation of the Romanesque forms of Auvergne to a large modern problem, would have displayed his mature manner, and been, perhaps, his greatest work; but the plan did not lend itself to the tradition or the ritual of the Anglican Church, and it was rejected, to his great disappointment.

At first the breadth of his compositions was offset by a richness of ornament which he afterwards called flamboyant, but there was a continual growth in simplicity. Some of his imitators have abused his example, running into mere baldness and brutality, but his own work never lost the fineness of quality with which he began, nor the adequacy of its detail.

Richardson’s uncommon personality so embodied itself in his works that it cannot be overlooked. He had an inexhaustible energy of body and mind, an enthusiasm more genial than combative, but so abounding and at times vehement that few men and few bodies of men could resist him.

Abounding energy he had, but not health. A serious bodily injury, and later a chronic malady, made his last years a constant struggle with suffering and infirmity, borne with indomitable cheerfulness, but at last fatal.

It is likely that the small number of his designs enhanced their quality. He put twice the labour into his work that the average architect would have given to it, and often twice the time, but the result was apt to be twice as good. He found American architecture restless, incoherent and exuberant; his example did much to turn it back to simplicity and repose. He came as near to establishing a style as it is given to a man to come; but the tendency of the time was too strong, and the classic styles, re-entering themselves, once more drove out the medieval.

The best known book about Richardson is Mrs Schuyler van Rensselaer’s H. H. Richardson and his Works (Boston, 1888).

Richardson, Sir John (1787-1869), British naturalist, was born at Dumfries on the 5th of November 1787. He studied medicine at Edinburgh, and became a surgeon in the navy in 1807. In 1819 he was appointed surgeon and naturalist to Franklin’s first arctic expedition (1819-22) and he served in the same capacity to the second (1825-26). The scientific results of these expeditions he described in contributions to Franklin’s Narratives, and especially in the four quarto volumes of his Fauna Boreali-Americana (1829-37). He was knighted in 1840, and in the following year was chosen commander of the Franklin search expedition (1845-49), the journal of which he published in 1851 under the title of An Arctic Searching Expedition. In 1855 he retired to Grassmere, where he died on the 4th of June 1865. He also wrote accounts dealing with the natural history, and especially the ichthyology, of several other arctic voyages, and was the author of Icones Pisceanes (1843), Catalogue of Apodal Fish in the British Museum, translated from the German MS. (1850), the second edition of Yarrell’s History of British Fishes (1860), and The Polar Regions (1861), expanded from an article with the same title which he wrote for the Encyclopaedia Britannica.

Richardson, Samuel (1669-1761), English novelist, is a notable example of that "late-flowering" sometimes applied to Other French writers. Born to William and Mary, the reign of the second George was well advanced before he came of age, he made his first serious literary effort—an effort which was not only a success, but the revelation of a new literary form. He was the son of a London printer, who, for obscure reasons, probably connected with Monmouth’s rebellion, had retired to an unidentified town in Derbyshire, where, in 1689, Samuel was born. At first intended for holy orders, and having little but the common learning of a private grammar school—for the tradition that upon the return of the family to the metropolis he went to Christ’s Hospital cannot be sustained—he was eventually, as some compensation for a literary turn, apprenticed at seventeen to an Aldersgate printer named John Wilde. Here, like the typical "good apprentice" of his century, he prospered; became successively compositor, corrector of the press, and printer on his own account; married his master’s daughter according to programme; set up newspapers and books; dabbled a little in literature by compiling indexes and "honest dedications," and ultimately proceeded Printer of the Journals of the House of Commons, Master of the Stationers’ Company, and Printer to the King. Like all men of the time, he had his city house, kept his house and his "country box" in the suburbs; and, after a thoroughly "respectable" life, died on the 4th of July 1761, being buried in St Bride’s Church, Fleet Street, close to his shop (now demolished), No. 11 Salisbury Court.

To this uneventful and conventional career one would scarcely look for the birth and growth of a fresh departure in fiction. And yet, although Richardson’s manifestation of his literary gift was deferred for half a century, there is no life to which the Horatian "qualis ab incepto" can be more appropriately applied. From his youth this moralist had moralized; from his youth—nay, from his childhood—this letter-writer had written letters; from his youth this supreme delineator of the other sex had been the confidant and counsellor of women. In his boyhood he was secretary-general to all the love-sick girls of the neighbourhood; at eleven he addressed a hortatory epistle, stuffed with texts, to a scandal-loving widow; and whenever it was possible to correspond with any one he was as "corresponding" as even Horace Walpole could have desired. At last, when he was known to the world only as a steady business man, who was always "mindful of the letter" and an invaluable compiler of the "puff prelatory," it occurred to Mr Rivington of St Paul’s Churchyard and Mr Osborn of Paternoster Row, two bookselling friends who were aware of his epistolary gifts, to suggest that he should prepare a little model letter-writer for such "country readers" as "were unable to indite for themselves." Would it be any harm, he suggested in answer, if he should also "instruct them how they should think and act in common cases"? His friends were all the more anxious that he should...
set to work. And thus originated his first novel of Pamela; or, *Virtue Rewarded.*

But not forthwith, as is sometimes supposed. Proceeding with the compilation of his model letter-writer, and seeking, in his own words, "to instruct handsome girls, who were obliged to go out on service...how to avoid the snare (that might be laid against their virtue)—a danger which appears to have always abnormally preoccupied him—he came to recollect a story he had heard twenty years earlier, and had often proposed to other persons for fictitious treatment. It occurred to him that it would make a book of itself, and might moreover be told wholly in the fashion most congenial to himself, namely, by letters. Thereupon, with some domestic encouragement, he completed it in a couple of months, between the 10th of November 1739 and the 10th of January 1740. In November 1740 it was issued by Messrs Rivington & Osborn, who, a few weeks afterwards (January 1741), also published the model letter-writer under the title of *Letters written to and for Particular Friends, on the most Important Occasions.* Both books were anonymous.

The letter-writer was noticed in the *Gentleman's Magazine* for January, which also contains a brief announcement as to Pamela, already rapidly making its way without waiting for the reviewers. A second edition, it was stated, was expected; and such was its popularity, that not to have read it was judged "as great a sign of want of curiosity as not to have seen the French and Italian dancers"—i.e. Mme Chateauneuf and the Fausans, who were then delighting the town. In February a second edition duly appeared, followed by a third in March and a fourth in May. At public gardens ladies held up the book to show they had got it; Dr Benjamin Slocok of Southwark openly commended it from the pulpit; Pope praised it; and at Slough, when the heroine triumphed, the enraptured villagers rang the church bells for joy. The other volume of "familiar letters" consequently fell into the background in the estimation of its author, who, though it went into several editions during his lifetime, never acknowledged it. Yet it scarcely deserves to be wholly neglected, as it contains many useful details and much shrewd criticism of lower middle-class life.

For the exceptional success of Pamela, there was the obvious excuse of novelty. People were tired of the old "mouthy" romances about impossible people doing impossible things. Here was a real-life story, which might happen to any one— a story which aroused curiosity and arrested attention—which was not exclusively about "high life," and which had, in addition, a moral purpose, since it was avowedly "published in order to cultivate the principles of virtue and religion in the minds of the youth of both sexes." Whether it had exactly this effect, or owed its good fortune chiefly to this proclamation, may be doubted. The heroine in humble life who resists the licentious advances of her master until he is forced to marry her, does not entirely convince us that her watchful prudence and keen eye for the main chance have not, in the long run, quite as much to do with her successful defence as her boasted innocence and purity. Nor is the book without passages which more than smack of an unpleasant pruriency. Nevertheless, in its extraordinary gift of minute analysis; in its intimate knowledge of feminine character; in the cumulative power of its shuffling, loose-shod style, and, above all, in the unquestionable truth and sincerity of the writer, Pamela had qualities which—particularly in a dead season of letters—sufficiency account for its favourable reception by the contemporary public.

Such a popularity, of course, was not without its drawbacks. That it would lead to Anti-Pamelas, censures of Pamela and all the spawn of pamphlets which spring round the track of a sudden success, was to be anticipated. One of the results to which its rather sickly morality gave rise was the *Joseph Andrews* (1742) of Fielding (q.v.). But there are two other works prompted by Pamela which need brief notice here. One is the *Apology for the Life of Mrs Shamela Andrews,* a clever and very gross piece of raillery which appeared in April 1741, and by which Fielding is supposed to have preluded to Joseph Andrews. Fielding's own works contain no reference to Shamela. But Richardson in his Correspondence, both printed and unprinted, roundly attributes it to the writer who was to be his rival; and it is also assigned to Fielding by other contemporaries (Hist. MSS. Comm., Rept. 12, App. Pt. IX. p. 204). All that can be said is, that Fielding's authorship cannot be proved. If it could, it would go far to justify the after animosity of Richardson to Fielding—much farther, indeed, than what Richardson described as the "lewd and ungenerous engraving" of Joseph Andrews. The second noteworthy result of Pamela was Pamela's *Conduct in High Life* (September 1741), a spurious sequel by John Kelly of the *Universal Spectator.* Richardson tried to prevent its appearance, and, having failed, set about two volumes of his own, which followed in December, and professed to depict his heroine "in her exalted condition." But the public interest in Pamela had practically ceased with her marriage, and the author's continuation, like other continuations—particularly continuations prompted by extraneous circumstances—attracted no permanent attention.

About 1744 we begin to hear something of the progress of Richardson's second and greatest novel, Clarissa; or, the *History of a Young Lady,* usually miscalled Clarissa Harlowe. The first edition was in seven volumes, two of which came out in November 1747, two more in April 1748 and the last three in December. Upon the title-page of this, of which the mission was as edifying as that of Pamela, its object was defined as showing the distresses that may attend the misconduct both of parents and children in relation to marriage. Virtue, in Clarissa, is not "rewarded," but hunted down and outraged. The heroine, no longer an opportunist servant-girl, is a most pure, refined and beautiful young woman, invested with every attribute to attract and charm, while her pursuer, Lovelace, the libertine hero of the book—a personage of singular dash and vivacity, in spite of his worthlessness—is drawn with extraordinary tenacity of power. The wronged Clarissa eventually dies of grief, and her cold-blooded betrayer, whom strict justice would have hanged, is considerably killed in a duel by her soldier cousin. Of the surplus of the story there is no need here to express any doubt as to the ability shown in the delineation of the two chief characters, to whom the rest are merely subordinate. The chief drawbacks of Clarissa are its merciless prolixity (seven volumes, which only cover eleven months); the fact that (like Pamela) it is told by letters; and a certain haunting and uneasy feeling that many of the heroine's obstacles are only molehills which should have been readily surmounted. As to its success, accentuated as this was by its piecemeal method of publication, there has never been any question. Clarissa's sorrows set all England sobbing, and her fate spread rapidly to the Continent.

Between Clarissa and Richardson's next work appeared the *Tom Jones of Fielding—a rival by no means welcome to the elder writer, although a rival who generously (and perhaps penitently) acknowledged Clarissa's rare merits.*

"Pectus inaniter angit Irritat, mulicet; falsis terroribus implet Ut Magus,"

Fielding had written in the *Jacobite's Journal.* But even this could not console Richardson for the popularity of the "spurious brat" whom Fielding had made his hero, and his next effort was the depicting of a genuine fine gentleman—a task to which he was incited by a chorus of feminine worshippers. In the *History of Sir Charles Grandison,* "by the Editor of Pamela and Clarissa" (for he still preserved the fiction of anonymity), he essayed to draw a perfect model of manly character and conduct. In the pattern presented there is, however, too much buckram, too much ceremonial—in plain words, too much priggishness—to make him the desired exemplar of propriety in excess. Yet he is not entirely a failure, still less is he to be regarded as no more than "the
condescending suit of clothes" by which Hazlitt unfairly defines Miss Burney's Lord Orville. When Richardson delineated Sir Charles Grandison he was at his best, and his experiences and opportunities for inventing such a character were infinitely greater than they had ever been before. And he lost nothing of his gift for portraying the other sex. Harriet Byron, Clementina della Porretta and even Charlotte Grandison, are no whit behind Clarissa and her friend Miss Howe. Sir Charles Grandison, in fine, is a far better book than Pamela, although M. Taine regarded the hero as only fit to be stuffed and put in a museum.

Grandison was published in 1753, and by this time Richardson was sixty-four. Although the book was welcomed as warmly as its predecessors, he wrote no other novel, contenting himself instead with indexing his works, and compiling an anthology of the "maxims," "cautions" and "instructive sentiments" they contained. To these things, as a professed moralist, he had always attached the greatest importance. He continued to correspond relentlessly with a large circle of worshippers, mostly women, whose counsels and fertilizing sympathy had not a little contributed to the success of his last two books. He was a nervous, highly strung little man, intensely preoccupied with his health and his feelings, hungry for praise when he had once tasted it, and afterwards unable to exist without it; but apart from these things, well meaning, benevolent, honest, industrious and religious. Seven vast folio volumes of correspondence (1766-1822), with a few men of the Young and Aaron Hill type, are preserved in the Forster Library at South Kensington. Parts of it only have been printed. There are several good portraits of him by Joseph Highmore, two of which are in the National Portrait Gallery.

Richardson is sometimes styled the "Father of the English Novel," a title which has also been claimed for Defoe. It would be more accurate to call him the father of the novel of sentimental analysis. As Sir Walter Scott has said, no one before had dived so deeply into the human heart. No one, moreover, had brought to the study of feminine character so much prolonged research, so much patience of observation, so much interested and indulgent apprehension, as this twisting little printer of Salisbury Court. That he did not more materially control the course of fiction in his own country was probably owing to the new direction which was given to that fiction by Fielding and Smollett, whose method, roughly speaking, was synthetic rather than analytic. Still, his influence is to be traced in Sterne and Henry Mackenzie, as well as in Miss Burney and Miss Austen, both of whom, it may be noted, at first adopted the epistolary form. But it was in France, where the Richardsonian soil was ready for the dressing, that the analytic process was most warmly welcomed. Extragavantly eulogized by the great critic, Diderot, modified with splendid variation by Rousseau, copied (unwillingly) by Voltaire, the vogue of Richardson was so great as to tempt some modern French critics to seek his original in the Marianne of a contemporary analyst, Marivaux. As a matter of fact, though there is some unconscious consonance of manner, there is nothing whatever to show that the little-lettered author of Pamela, who was also ignorant of French, had the slightest knowledge of Marivaux or Marianne. In Germany Richardson was even more popular than in France. Gellert, the fabulist, translated him; Wieland, Lessing, Herses, all imitated him, and Coleridge detects him even in the Robbers of Schiller. What was stranger still, he returned to England again under another form. Having given a fillip to the French comédie larmoyante, that comedy crossed the channel as the sentimental comedy of Cumberland and Kelly, which, after a brief career of prosperity, received its death-blow at the hands of Goldsmith and Sheridan.

Antoine Richardson's Correspondence was published by Mrs A. L. Barbauld in 1804, in six volumes, with a valuable Memoir. Recent lives are by Miss Clara L. Thomson, 1900, and by Austin Dobson ("Men of Letters"), 1902. A convenient reprint of the novels, with copies of the old illustrations by Stothard, Edward Burney and the rest, and an introduction by Mrs E. M. M. McKenna, was issued in 1901 in 20 volumes.

RICHELIEU, ARMAND EMMANUEL SOPHIE SEPTEMBRE DE LA PLESSIS, DUC DE (1766-1822), French statesman, was born in Paris on the 23rd of September 1766, the son of Louis Antoine du Plessis, duc de Brissac and grandson of the marshal de Richelieu (1696-1758). The comte de Chillon, as the heir to the Richelieu honours was called, was married at fifteen to Rosalie de Rochecouart, a deformed child of twelve, with whom his relations were never more than formal. After two years of foreign travel he entered the Queen's dragons and next year received a place at court, where he had a reputation for Puritan austerity. He left Paris in 1760 for Vienna, and in company with his friend Prince Charles de Ligne joined the Russian army as a volunteer, respecting the Russian headquarters at Bender on the 21st of November. He was present at the capture of Ismailia and received from the empress Catherine the cross of St George and a golden sword. By the death of his father in February 1791, he succeeded to the title of duc de Richelieu. He returned to Paris shortly afterwards on the summons of Louis XVI., but he was not sufficiently in the confidence of the court to be informed of the projected flight to Varennes. In July he obtained a passport from the National Assembly for service in Russia. In the Russian army he obtained the grade of general-major, only to be forced by the intrigues of his enemies to resign. The accession of Alexander I. made it possible for Burney's Correspondence to be received from the list of émigrés, which he had failed to secure from Napoleon, was recorded on the request of the Russian government, and in 1803 he became governor of Odessa. Two years later he became governor general of the Chersonese, of Ekaterinoslav and the Crimea, then called New Russia. In the eleven years of his administration, Odessa rose from a miserable village to an important city. He commanded a division in the Turkish War of 1806-7, and was engaged in frequent expeditions to the Caucasus. Richelieu returned to France in 1814; on the triumphant return of Napoleon from Elba he accompanied Louis XVIII. in his flight as far as Lille, whence he went to Vienna to join the Russian army, believing that he could best serve the interests of the monarchy and of France by attaching himself to the headquarters of the emperor Alexander. Richelieu's character and antecedents alike marked him out as valuable support of the monarchy after its second restoration. Though the bulk of his confiscated estates were lost beyond recall, he did not share the resentment of the mass of the returned émigrés, from whom and their intrigues he had held aloof during his exile, and was far from sharing their delusions as to the possibility of undoing the work of the Revolution. As the personal friend of the Russian emperor his influence in the councils of the Allies was likely to be of great service. He refused, indeed, Talleyrand's offer of a place in his ministry, pleading his long absence from France and ignorance of its conditions; but after Talleyrand's retirement he consented to follow him as prime minister, though—as he himself said—he did not know the face of one of his colleagues.

The events of Richelieu's tenure of office are noticed elsewhere (see FRANCE: History). Here it need only be said that it was mainly due to his efforts that France was so early relieved of the burden of the allied army of occupation. It was for this purpose mainly that he attended the congress of Aix-la-Chapelle in 1818. There he had been informed in confidence of the renewal by the Allies of their treaty binding them to interfere in case of a renewal of revolutionary trouble in France; and it was partly owing to this knowledge that he resigned office in December of the same year, on the refusal of his colleagues to support a reactionary modification of the electoral law. After the murder of the duc de Berry and the enforced retirement of Decazes, he again became president of the council (21st February 1821); but his position was untenable owing to the attacks of the "Ultras" on the one side and the Liberals on the other, and on the 12th of December he again resigned. He died of apoplexy on the 17th of May 1822.
Great part of Richelieu’s correspondence with Pozzo di Borgo, Capo d’Istria and others, with his journal of his travels in Germany and the Turkish campaign, and a notice by the duchesse de Richelieu, is published by the Imperial Historical Society of Russia, vol. 54. There is an exhaustive study of his career by L. de Lajouze-Clerc, *Le Duc de Richelieu en Russie et en France* (1897), with which compare an article by L. Rioult de Neuvillé in the *Revue des questions historiques* (Oct. 1897). See also R. de Cisternois, *Le Duc de Richelieu, son action aux congrès d’Aix-la-Chapelle* (1898), containing copies of documents.

**RICHIELIEU, ARMAND JEAN DU PLESSIS DE, CARDINAL** (1585-1642), French statesman, was born of an ancient family of the lesser nobility of Poitou. The original name of the family was Du Plessis, but in the 15th century a younger branch obtained by marriage the estate of Richelieu with its strong castle surrounded by the waters of the Mable, and took the name of Du Plessis de Richelieu. The family produced not a few turbulent warriors during the Hundred Years’ War, and the cardinal’s father, François de Plessis, seigneur de Richelieu, began his career by killing the murderer of his elder brother and then fighting through the wars of religion, first as a favourite of Henry III., and after his death under Henry IV. He was a typical fighting gentleman of the period. The mother of the cardinal, Susanne de La Porte, belonged to a family of the magistrature, her father, François de La Porte, being one of the first advocates of the parlement of Paris. Armand was the third son and was born in Paris on the 9th of September 1585. When he was five years old his father died while assisting at the siege of Paris (on the 10th of July 1590); and his mother was left with five children and the estate heavily in debt. By care and economy, however, aided by generous royal grants, she was enabled to pay off mortgages and to bring up the children in a way befitting their rank. At the age of nine Armand was sent to Paris to the College of Navarre, where he passed with credit the regular courses in grammar and philosophy, and then entered the famous Academy of Conciergerie which prepared the aspirants to the life of a counselor or a cavalier. But his training for a military career was suddenly cut short by the refusal of his elder brother, Alphonce, to accept the office of bishop of Luçon. The right of preferment to that see had been given to the Richelieu family by Henry III. as a reward for the services of Armand’s father, and the family drained its revenues for private use. When the cathedral chapter found courage to oppose this and opened suit to recover the ecclesiastical revenues for ecclesiastical purposes, Richelieu’s mother proposed to make her second son, Alphonce, bishop. He defeated this scheme, however, by becoming a monk of the Grande Chartreuse, and Armand, whose health was rather feeble in any case for a military career, was induced to propose himself for the priesthood.

In 1606, at the age of twenty-one, Richelieu was nominated bishop of Luçon by Henry IV. As he was almost five years under canonical age, he was obliged to obtain a dispensation and was consecrated there in April 1607. In the winter of 1608 Richelieu went out to his poverty-stricken little bishopric, and for the next six years devoted himself seriously to his episcopal duties. He became favourably known among the zealous reformers of the church, and it was during this stage of his career that he made a friend of Father Joseph. Meanwhile he was impatiently waiting for an opening to a larger career. This came in 1614 when he was elected by the clergy of Poitou to the last States-general which met before the Revolution. In this he attracted the favourable attention of Marie de’ Medici, the queen-mother, and was chosen at its close to present the address of the clergy embodying its petitions and resolutions. After the States-general dissolved he remained in Paris, and the next year he became almoner to Anne of Austria, the child-queen of Louis XIII. Then, by adorning his poverty intricate and faithful service to Concini, he was appointed in 1616 a secretary of state to the king. But he owed all to Concini, and his taste of power ended with the murder of his patron on the 24th of August 1617.

The reign which Richelieu was to dominate so absolutely began with his exile from the court. He had, however, already shown his ability, his firmness, and his diplomatic skill, and conducted the negotiations on the part of the queen-mother with Luynes, the king’s representative. Then, as he had incurred too much of the odium of a creature of Concini to hope for royal favour, he resigned himself to the post of chief adviser to Marie de’ Medici in her exile at Blois. Here he sought to ingratiate himself with Luynes and the king by reporting minutely the actions of Marie and by protestations of loyalty. As this ungrateful work brought no reward, Richelieu, in spite of the earnest entreaties of the queen-mother, retired once more to his bishopric. But the king, while approving his conduct, was still suspicious of him, and he was exiled to Avignon, along with his brother and brother-in-law, on the 7th of April 1618. There he lived in discreet, if melancholy retirement, writing "A Defence of the Main Principles of the Catholic Faith," and had apparently little hope of a further political career when the escape of Marie de’ Medici from Blois, on the 2nd of February 1619, again opened paths for his ambition. Luynes and the king recalled him to the post at Angoulême with the queen-mother, who received him ungraciously but who soon yielded to his judgment and allowed him to sign the treaty of Angoulême with the Cardinal de la Rochefoucauld, acting for the king. By this treaty Marie was given liberty to live wherever she wished, and the government of Anjou and of Normandy with several castles was entrusted to her. The bishop of Luçon was led to believe that the king would recommend him for a cardinalate, but, if we may trust the evidence, Luynes secretly opposed the request, and it was not until after his death that Richelieu was made a cardinal by Pope Gregory XV., on the 5th of September 1622. His rank in the church was due to his skill in intrigue with Marie de’ Medici.

Luynes’s death on the 15th of December 1621 made possible a reconciliation a month later between the king and his mother. Richelieu, however, had poisoned the atmosphere, as his departure for Rome had broken his heart, and disliked his dominating minister more, he allowed her to remain in her residence in the Luxembourg palace in Paris, thus rendering intercourse possible. Richelieu seized his opportunity. He furnished Marie de’ Medici with political ideas and acute criticisms of the king’s ministry, especially of the Brularts. Marie zealously pushed her favourite towards office, and had gone so far as to absent herself from court for three months on account of the king’s persistent refusal, when Charles, duc de La Vieuville, then head of the council, in need of her aid in his negotiations with reference to the marriage of her daughter Henriette Marie, finally agreed to force Richelieu’s appointment to office upon the king, Louis XIII. La Vieuville thought to compromise by forcing the cardinal into a "council of despatches," with merely the privilege of advising the king’s council but entrusted with no power. Richelieu raised many objections to such a partial realization of his ambition, but the king forced them; in April 1624 by naming him a member of his council. By August Vieuville’s worst fears were realized; he was arrested on the 13th of the month for corrupt practices in office, and the intriguing cardinal who had caused his overthrow became chief minister of Louis XIII. His advent was hailed with joy by both the Catholic party and the patriotic party, eager for the overthrow of Habsburg supremacy in Europe.

For the next eighteen years the biography of Richelieu is the history of France, and to a large degree that of Europe. His work was directed toward a twofold aim: to make the royal power—his power—absolute and supreme at home, and to crush the rival European power of the Habsburgs. At home there were two opponents to be dealt with: the Huguenots and the feudal nobility. The former were crushed by the siege of La Rochelle and the vigorous campaign against the duc de Rohan. But the religious toleration of the edict of Nantes was reaffirmed while its political privileges were destroyed, and Huguenot officers fought loyally in the foreign enterprises of the cardinal.

The suppression of the independence of the feudal aristocracy was inaugurated in 1626 by an edict calling for the destruction of all fortified castles not needed for defence against invasion.
The local authorities proceeded to carry this out with a zeal due to long suffering, and the ruined medieval châteaux of France still bear witness to the action of Richelieu. Still there was no serious opposition to the new minister. The first serious conspiracy took place in 1636, the king fled, Gaston of Orleans, being the centre of it. His governor, Marshal D'Ornano, was arrested by Richelieu's orders, and then his confidant, Henri de Talleyrand, marquis de Chalais and Vendôme, the natural sons of Henry IV. Chalais was executed and the marshal died in prison. The overthrow of the Huguenots in 1629 made Richelieu's position seemingly unassailable, but the next year it received its severest test. Marie de' Medici had turned against her "ungrateful" minister with a hatred intensified, it is said, by unrequited passion. In September 1630, while Louis XIII. was very ill at Lyons, the two queens, Marie and Anne of Austria, reconciled for the time, won the king's promise to dismiss Richelieu. He postponed the date until peace should be made with Spain. When the news came of the truce of Regensburg Marie claimed the fulfilment of the promise. On the 10th of November 1630 the king went to his mother's apartments at the Luxembourg palace. Orders were given that no one should be allowed to disturb their interview, but Richelieu entered by the unguarded chapel door. When Marie had recovered breath from such audacity she proceeded to attack him in the strongest terms, declaring that the king must choose between him or her. Richelieu left the presence feeling that all was lost. The king gave a sign of yielding, appointing his brother of Marillac, Marie's counsellor, to the command of the army in Italy. But before taking further steps he retired to Versailles, then a hunting lodge, and there, listening to two of Richelieu's friends, Claude de Saint-Simon, father of the memoir writer, and Cardinal La Valette, sent for Richelieu in the evening, and while the salons of the Luxembourg were full of expectant courtiers the king was reassuring the cardinal of his continued favour and support. The "Day of Dupes," as this famous day was called, was the only time that Louis took so much as a step toward the dismissal of a minister who was personally distasteful to him but who was indispensable. The queen-mother followed the king and cardinal to Compiègne, but as she refused to be reconciled with Richelieu she was left there alone and forbidden to return to Paris. The next summer she fled across the frontiers into the Netherlands, and Richelieu was made a duke. Then Gaston of Orleans, who had fled to Lorraine, came back with a small troop to head a rebellion to free the king and country from "the tyrant." The only great noble who rose was Henri, duc de Montmorency, governor of Languedoc, and his defeat at Castelnaudary on the 1st of September 1632 was followed by his speedy trial by the parlement of Toulouse, and by his execution. Richelieu had sent to the block the first noble of France, the last of a family illustrious for seven centuries, the feudal head of the nobility of Languedoc, who, covered by treaties or entreaties, incapable as fate itself, he cowed all opposition by his relentless vengeance. He knew no mercy. The only other conspiracy against him which amounted to more than intrigue was that of Cinq Mars in 1642, at the close of his life. This vain young favourite of the king was treated as though he were really a formidable traitor, and his friend, De Thou, son of the historian, whose sole guilt was not to have revealed the plot, was placed in a boat behind the stately barge of the cardinal and thus conveyed up the Rhone to his trial and death at Lyons. The voyage was symbolical of Richelieu's whole pitiless career.

Richelieu's foreign policy was as inflexible as his home policy. To humble the Habsburgs he aided the Protestant princes of Germany against the emperor, in spite of the strong opposition of the disappointed Catholic party in France, which had looked to the cardinal as a champion of the faith. The year of Richelieu's triumph over the Huguenots (1629) was also that of the Emperor Ferdinand's triumph in Germany, marked by the Edict of Restitution, and France was threatened by a united Germany. Richelieu, however, turned against the Habsburgs young Gustavus Adolphus of Sweden, paying him a subsidy of a million livres a year by the treaty of Bârwałd of the 23rd of January 1631. The dismissal of Wallensten, which is often attributed to the work of Father Joseph, Richelieu's envoy to the diet of Regensburg in July and August of 1632, was due rather to the fears of the electors than to the weight of double value to Richelieu when his Swedish ally marched south. After the treaty of Prague, in May 1635, by which the emperor was reconciled with most of the German princes, Richelieu was finally obliged to declare war, and, concluding a treaty of offensive alliance at Compiègne with Oxenstierna, and in October one at St Germain-en-Laye with Bernard of Saxe-Weimar, he proceeded himself against Spain, both in Italy and in the Netherlands. The war opened disastrously for the French, but by 1642, when Richelieu died, his armies—risen from 12,000 men in 1621 to 50,000 in 1638—had conquered Roussillon from Spain; they held Catalonia, which had revolted from Philip IV. of Spain, and had taken Turin and forced Savoy to allow French troops on the borders of the Milanese. In Germany Torstensson was sweeping the imperialist forces before him through Silesia and Moravia. The lines of the treaty of Westphalia, six years later, were already laid down by Richelieu; and its epochal importance in European history is a measure of the genius who threw the balance of power from Habsburg to Bourbon. The predominance of Louis XIV. in European politics was largely due to the statesman who prepared France for his absolutism at home.

The magnitude of Richelieu's achievement grows when one considers his relations with the king. Louis XIII. cordially disliked him, and would gladly have got rid of him if he had not been able to convince the king of the wisdom of everything he did. Thus obliged to assume the unpleasant rôle of tutor when delicate flattery was often most needful, the minister lectured and cajoled his master, always, until towards the last, giving credit to the king for his own successes, and overawing opposition by his imperious presence even when Louis was dabbling in plots against him (as in the case of Cinq Mars) behind his back. The king's consciousness of his weakness was combined with a sense of duty, and it was upon these two chords that Richelieu played. Besides, he was eternally on the alert. Spies in every salon in Paris and every court in Europe kept the grim courtier informed of every change in his master's disposition and every intrigue against himself. The piquant comments of his platonic friend, Mademoiselle de Hautefort, upon Richelieu were relished by the king until he was informed of others said to have been made by her upon himself. Then it was easy to supplant her with another favourite, Mademoiselle de Lafayette. When this devout maiden began to denounce the ungodly cardinal who was allied with heretics, her confessor—in Richelieu's service—succeeded in inducing her to become a nun. Father Causin, then urged her to purchase the same comments, and Louis plotted like a schoolboy to turn his devotions into secret criticisms of state policies. Causin was sent into Brittany, and the judicial and learned Jesuit, Jacques Sirmond, who succeeded him, kept clear of politics. Such was the atmosphere of the court in which Richelieu had to maintain his authority.

His own personality was his strongest ally. The king himself quailed before that stern, august presence. His pale, drawn face was set with his iron will. His frame was sickly and wasted with disease, yet when clad in his red cardinal's robes, his stately carriage and confident bearing gave him the air of a prince. His courage was mingled with a mean sort of cunning, and his ambition loved the outward trappings of power as well as its reality; yet he never swerved from his policy in order to win approval, and the king knew that his one motive in public affairs was the welfare of the realm—that his religion, in short, was "reason of state." A clear conscience, not less than a sense of his own superiority to others at the court of Louis XIII., made the cardinal haughtily assert his ascendancy, and the king shared his belief in both.

No courtier was ever more assertive of his prerogatives. He claimed precedence over even princes of the blood, and one
like Condé was content to draw aside the curtains for him to pass, and to sue for the hand of Richelieu's niece for his son, the "Grand Condé." His pride and ambition were gratified by the hand of a lady of the house of France, and a marriage was arranged for the two nieces, whose hands were sought by the noblest of the realm. Like all statesmen of his time, Richelieu made money out of politics. He came to court in 1617 with an income of 25,000 livres from his ecclesiastical benefices. In the later years of his life it exceeded 3,000,000 livres. He lived in imperial state, building himself the great Palais Cardinal, now the Palais Royal, in Paris, another at Rueil near Paris, and rebuilding his ancestral château in Poitou. His table cost him a thousand crowns a day, although he himself lived simply. He celebrated his triumphs to the full with gorgeous fêtes in his palace, especially with lavish theatrical representations. In January 1641 the tragedy of Miramé, said to have been his own, was produced with great magnificence. Richelieu was anxious for literary fame, and his writings are not unworthy of him. But more important than his own efforts as an author were his protection and patronage of literary men, especially of Cornelle, and his creation of the French Academy in 1635. His influence upon French literature was considerable and lasting. Hardly less important was his rebuilding of the Sorbonne and his endowments there. When he died, on the 4th of December 1642, he was buried in the chapel of the Sorbonne, which still bears his name to this day. His tomb, erected in 1642, then disappeared. A few years after the Revolution the skeleton was exhumed.

Many writings are attributed to Richelieu, although owing to his habit of working with substitutes and assistants it is difficult to settle how much of what passes under his name is authentic. Les Théâtères, La Grande Pastorela, Miramé, and the other plays, over whose authorship he has been at some pains to mislead, are an exception. His Memoires and correspondence, Mémoires d'Armand de Plessis, évêque de Luçon, written in his own hand, dated 1607 to 1610, and his correspondence with the cardinal of Richelieu, were published by Armand Baschet (1862) and Pierre de la mère et du fils (i.e. of Marie de Medicis and Louis XIII), sometimes attributed to Mazarin, published at Amsterdam in 1670 and, under the title Histoire de la régence de Marie de Médicis, femme de Henri IV., at the Hague in 1745; Mémoires sur sa régence de Louis XIII, published in 1823, and of which the earlier portion is a reprint of the Histoire de la mère et du fils, published in Petiton's collection (Paris, 1823 seq.); Testament politique d'Armand du Plessis, cardinal de Richelieu (Amsterdam, 1823); Journal de la cour de France, 1627-31 (Paris, 1829); Instructions diplomatiques et papiers d'état, published by G. d'Avéne in the Coll. doc. inéd. (Paris, 1855-77); and Maximes d'état et fragments politiques, published by G. Hanotaux in Mélanges historiques de la Société des Sciences de la Société des Sciences de la Soc., in 1865, were his collections.

See G. Hanotaux, Cardinal Richelieu (1883), one of the four then published, an exhaustive history of the period down to 1614; and G. d'Avéne, Richelieu et la monarchie absolu (4 vols., 1865). The most important sources for Richelieu's statemanship are the "lettres diplomatiques, et papiers d'état," mentioned above, and Richelieu's Mémoires (1610-38) may be consulted in Petiton's and J. F. Michaud and J. Poujollet's collections. Innumerable memoirs of the time also bear upon his life, e.g. those of Madame de Mertonneau, Mattieu Molé, De Brinon, and Bassompierre. In English there are short biographies by Richard Lodge (in the Foreign Statesmen series, 1869) and by J. B. Perkins (in Heroes of the Nations series, 1900). (J. T. S.*).

RICHIELIEU, LOUIS FRANÇOIS ARMAND DE PLESSIS, duc de (1646-1788), marshal of France, was a grandnephew of Cardinal Richelieu, and was born in Paris on the 13th of March 1690. Apart from his reputation as a man of exceptionally loose morals, he attained, in spite of a debonairly defective education, distinction as a diplomatist and general. As ambassador to Vienna (1725-29) he settled in 1727 the preliminaries of peace; in 1733-34 he served in the Rhine campaign. His real public career began ten years later. He fought with distinction at Dettingen and Fontenoy, where he directed thegrapeshot upon the English columns, and three years afterwards he made a successful defence of Genoa; in 1750 he expelled the English from Minorca by the capture of the San Felipe fortress; and in 1757-58 he closed his military career by those ill-fated campaigns in Hanover which procured him the sobriquet of Petit Père de la Marine. After the wars he plunged again into court intrigue, favoured the comtesse du Barry and supported his nephew the duc d'Aiguillon. Louis XVI., however, was not favourably inclined to him. In his early days he was thrice imprisoned in the Bastille: in 1711 at the instance of his stepfather, in 1716 in consequence of a murder, and in 1719 for his share in Alberoni's conspiracy against the crown of France. He was thrice married: first, against his will, at the age of forty-five to Anne Catherine de Noailles; secondly, in 1734, by the intrigues (according to the witty Frenchman's own account) of Voltaire, to Elisabeth Sophie, Madame Isoude de Guise; and thirdly, when he was eighty-four years old, to an Irish lady. He died in Paris on the 8th of August 1788. Marshal Richelieu's Mémoires, published by J. L. Soulavie in nine volumes (1790), are partially spurious. See H. Noel Williams, The Fascinating Duc de Richelieu (1910). RICHEPIN, JEAN (1849- ), French poet, novelist and dramatist, the son of an army doctor, was born at Meude (Algeria) on the 4th of February 1849. At school and at the École normale he gave evidence of brilliant, if somewhat undisciplined, powers, for which he found physical vent in different directions—first as a franc-tireur in the Franco-German War, and afterwards as actor, sailor and stevedore—and an intellectual outlet in the writing of poems, plays and novels which vividly reflected, his erratic but unmistakable talent. A play, L'Édie, written by him in collaboration with André Gide (1894-95), was produced in 1873; but Richépin was virtually unknown up to 1876, the publication, in 1876, of a volume of verse entitled Chanson des gueux, when his outspokenness resulted in his being imprisoned and fined for outrage aux murs. The same quality has characterized his succeeding volumes of verse: Les Caresses (1877), Les Bîstrophèmes (1884), La Mer (1886), Mes parâdis (1894), La Bombarde (1896). His novels have developed in style from the morbidness and brutality of Les Morts bizarres (1876), La Glu (1881) and Le Pape (1883) to the more thoughtful psychology of Madame Andrée (1878), Sophie Monnier (1884), Césarine (1888), L'Aîné (1893), Grandes amoureuses (1896) and La Sibylle (1899), and the more simple portrayal of life in Miarka (1883), Les Braves Gens (1886), Travaissardes (1890), La Misérable (1892) and Flamboye (1895). His plays, though occasionally marred by his characteristic pravity to violence of thought and language, constitute in many respects his best work. The most notable are Nana Sahib (1883), Monseigneur Scapin (1886), Le Flibustier (1888), Par le gâteau (1892), Vers la joie (1894), Le Chemineau (1897), Le Chien de garde (1898), Les Trouvards (1899), Don Quichotte (1905), most of which were produced at the Comédie française. He also wrote the novel Miarka (1905), adapted from his novel, for the music of Alexandre Georges, and Le Mage (1897) for the music of Jules Massenet.

His son, Jacques Richépin (b. 1880), the author of La Reine de Tyr (1899), La Cavalière (1901), Cadet-Roussel (1903) and Falstaff (1904), based on Shakespeare's Henry IV., gave promise of making his mark as a dramatist.

RICHERUS, monk of St Remi at Reims, and a chronicler of the 10th century, son of Rudolf, a trusty councillor and captain of Louis IV. He studied at Reims under Bercht, afterwards Pope Silvester II., who taught him mathematics, history, letters and eloquence. He was also well versed in the medical science of his time, and in 901 travelled to Chartres to consult the medical MSS. there. He was still living in 998, but there is no mention of him after that date. In spite of his violent partisanship,—for Richerus was an ardent upholder of the Carolings and French supremacy,—of great defects of style, and of an utter disregard of accuracy and truth, his Historie has a unique value as giving us the only tolerably full account by a contemporary of the memorable revolution of 897, which placed the Capets on the throne of France. The History, in four books, begins with Charles the Fat and Eudes, and goes down to the year 987. From 989 onwards Richerus had no earlier history before him, and his work is the chief source for the period. It was first edited in Pertz's Monumenta Germaniae, vol. iii.
There are French translations by Guadet (Paris, 1845, Soc. de l’hist. de France); Pognion (Reims, 1855, pub. de l’Academie de Rheims); and a German version by K. Freiherr v. der Osten-Sacken (Berlin 1854). Cf. Molinier, Sources de l’histoire de France, i. 284 (ed. 1901).

RICHFIELD SPRINGS, a village of Richfield township, Otsego county, New York, U.S.A., about 22 m. S.S.E. of Utica and 2 m. N. of Schuyler (or Candarago) lake. Pop. (1850) 1623; (1900) 1537; (1905) 1684; (1910) 1903. It is served by the Delaware, Lackawanna & Western railway, and by the Oneonta & Mohawk Valley electric line connecting with the New York Central railway at Herkimer. The village is situated in a farming country, about 1700 ft. above sea-level. Knit goods are manufactured, but the importance of the place is due to its sulphur springs, the waters of which are used for the treatment of skin diseases, gout, rheumatism, etc., and to the tonic air and fine scenery. In 1908 a Welsh eisteddfod was held here in Earlington Park. The first hotels were built between 1820 and 1830. A post office was established here in 1829, and the village was incorporated in 1861.

RICHFIELD HILL, the city of Bates county, Missouri, U.S.A., situated on the Osage (Marais des Cygnes) river, in the west-central part of the state, about 75 m. S. by E. of Kansas City. Pop. (1900) 4535, of whom 255 were foreign-born; (1920) 7255. It is served by the Missouri Pacific and the St. Louis & San Francisco railway systems. The city has two public parks, and is a trading centre for the surrounding fertile farming country. Coal is mined in the vicinity. There are lead and zinc smelters, and a large vitrified brick and tile factory. The municipality owns and operates its waterworks and gas and electric-lighting plants; the city is supplied with natural gas. The original Rich Hill was platted in 1867 somewhat north-west of the site of the present city, which was platted in 1880 by an association that bought out the old settlement. The new settlement was incorporated as a village in 1886, and charted as a city in 1881.

RICHMOND, EARLS AND DUKES OF. The title earl of Richmond appears to have been in existence in England a considerable time before it was held in accordance with any strict legal principle. Alan, surnamed “Le Roux,” and his brother Alan (c. 1049-1089), surnamed “Le Noir,” relatives of Geoffrey, count of Brittany, and kinsman of William the Conqueror, took part in the latter’s invasion of England, and Le Roux obtained grants of land in various parts of England, including manors formerly held by Earl Edwin in Yorkshire, on one of which he built the castle of Richmond, his possessions there being formed into the honour of Richmond, to which his brother Alan Le Noir, or Alan Niger (c. 1045-1093), succeeded in 1089. The latter was in turn succeeded as lord of the honour of Richmond by Stephen (d. 1137), count of Penthierville, who was either his son or another brother. These Breton counts, being territorial barons of great importance in England, and lords of the honour of Richmond where their castle was situated, are often reckoned as earls of Richmond, though they were not so in the strict and later sense. The same should perhaps be said of Stephen’s son Alan Niger II. (c. 1176-1146), though he was styled earl of Richmond by John of Hexham. This Alan married Bertha, daughter and heiress of Conan, reigning count of Brittany; and his son Conan (c. 1138-1171), who married Margaret, sister of Malcolm IV. of Scotland, asserted his right to Brittany, and transferred it in his lifetime to his daughter Constance (c. 1162-1201). As he left no sons the honour of Richmond and his other English possessions passed to the king in 1171, though Constance is also loosely spoken of as countess of Richmond in her own right. Constance was three times married, and each of her husbands in turn assumed the title of earl of Richmond, in conjunction with that of count, or duke of Brittany. They were: Geoffrey Plantagenet (1158-1186), son of Henry II., king of England; Randolph de Blundeville, earl of Chester (c. 1172-1232), the marriage with whom Constance treated as null on the ground of consanguinity; and Guy de Thouars (d. 1213), who survived his wife for twelve years. The only son of the first marriage, Arthur of Brittany (1187-1203), was styled earl of Richmond in his mother’s lifetime, and on his murder at the hands of his uncle, King John, the earldom was resumed by the crown.

By her third husband Constance had two daughters, the elder of whom, Alice, was given in marriage by Philip Augustus, king of France, to Peter de Braine in 1233, after which date Peter was styled duke of Brittany and earl of Richmond till about 1235, when he renounced his allegiance to the king of England and thereupon suffered forfeiture of his English earldom. In 1241 Henry III. granted the honour of Richmond to Peter of Savoy (1203-1268), uncle of Queen Eleanor, who was thereafter described as earl of Richmond by contemporary chroniclers, though how far he was strictly entitled to the designation has been disputed. By his will he left the honour of Richmond to his niece, the queen consort, who transferred it to the crown. In the same year (1268) Henry III. granted the earldom specifically to John, duke of Brittany (1217-80), son of Peter de Braine, in whose family the title continued—though it frequently was forfeited or reverts to the crown and was re-granted to the next heir till 1342, when it was transferred to Edward III. and granted by that sovereign to his son John of Gaunt, who surrendered it in 1372. It was then given to John de Montfort, duke of Brittany, but on his death without heirs in 1399, or possibly at an earlier date through forfeiture, it reverted to the crown. The earldom now became finally separated from the duchy of Brittany, with which it had been loosely conjoined since the Conquest, although the dukes of Brittany continued to assume the title till a much later date. From 1414 to 1415 the earldom of Richmond was held by John Plantagenet, duke of Bedford, and in 1415 it was conferred on Edmund Tudor, uterine brother to King Henry VI., whose wife, Margaret Beaufort, was the foundress of St John’s College, Cambridge, and of the "Lady Margaret" professorships of divinity at Oxford and Cambridge (see RICHMOND AND DERBY, MARGARET, COUNTESS OF). When Edmund Tudor’s son Henry ascended the throne as Henry VII. in 1485, the earldom of Richmond merged in the crown, and from then on for centuries there was no further reference to the title; but in 1555 Henry Fitzroy, natural son of Henry VIII. by Elizabeth Blount, was created duke of Richmond and Somerset and earl of Nottingham, all these titles becoming extinct at his death without children in 1556.

Ludovic Stuart, 2nd duke of Lennox (1574-1624), who also held other titles in the peerage of Scotland, was created earl of Richmond in 1613 and duke of Richmond in 1623. These became extinct at his death in 1624, but his Scottish honours devolved on his brother Esmé, who was already earl of March in the peerage of England (see MARCH, EARLS OF; and LENNOX). Esmé’s son, James, 4th duke of Lennox (1612-1655), was created duke of Richmond in 1641, the two dukedoms as well as the lesser English and Scottish titles thus becoming again united. In 1672, on the death of his nephew Charles, 3rd duke of Richmond and 6th duke of Lennox, whose wife was the celebrated beauty called "La Belle Stuart" at the court of Charles II. (see RICHMOND AND LENNOX, FRANCES TERESE, DUCHESS OF), his titles became extinct.

In 1675 Charles II. created his illegitimate son Charles duke of Richmond, earl of March and baron Settrington, and a few weeks later duke of Lennox, earl of Darnley and baron Torbolton. This Charles (1672-1723), on whom his father the king bestowed the surname of Lennox, was the son of the celebrated Louise de Keroualle, duchess of Portsmouth. His son Charles, 2nd duke (1701-1750), added to the titles he inherited from his father that of duke of Aubigny in France, to which he succeeded in 1734 on the death of his grandmother the duchess of Portsmouth; and all these honours are still held by his descendant the present duke of Richmond.

The seven dukedoms of the Lennox line have all borne the Christian name of Charles. The 2nd duke, by his marriage with Sarah, daughter of the 1st Earl Cadogan, was father of Lady Caroline Lennox, who eloped with Henry Fox,
and was the mother of Charles James Fox, and of the beautiful
Lady Sarah Lennox (1745-1826) with whom George III. fell
in love and was eloped. He married her, and afterwards married,
first, Sir Thomas Bunbury, from whom she was divorced, and
secondly, George Napier, by whom she was the mother of
Generals Sir Charles and Sir William Napier.

Charles, 3rd Duke of Richmond (1733-1806), was one of the
most remarkable men of the 18th century, being chiefly famous
for his advanced views on the question of parliamentary reform.

Having succeeded to the peerage in 1750, he was appointed
British ambassador extraordinary in Paris in 1765, and in the
following year he became a secretary of state in the Rockingham
administration, resigning office on the accession to power of the
earl of Chatham. In the debates on the policy that led to the
War of American Independence Richmond was a firm supporter
of the colonists; and he initiated the debate in 1778 calling
for the removal of the troops from America, during which
Chatham was seized by his fatal illness. He also advocated a
policy of concession in Ireland, with reference to which he
originated the phrase "a union of hearts" which long afterwards
became famous when his use of it had been forgotten. In 1779
he brought forward a motion for re-election of the
civil list; and in 1780 he embodied in a bill his proposals for
parliamentary reform, which included manhood suffrage,
annual parliaments and equal electoral areas. Richmond sat
in Rockingham's second cabinet as master-general of ordinance;
and in 1783 he joined the ministry of William Pitt. He now
developed strongly Tory opinions, and his alleged desertion of
the cause of reform led to a violent attack on him by Lauderdale
in 1792, which nearly led to a duel between the two noblemen.

Richmond died in December 1806, and, leaving no legitimate
children, he was succeeded in the peerage by his nephew Charles,
son of his brother, General George Henry Lennox.

The 4th duke (1764-1819) and his wife Charlotte, daughter
of the 4th duke of Gordon, were the givers of the famous ball
at Brussels on the night before the battle of Quatre Bras,
immortalized in Byron's "Childe Harold." Their son, the 5th duke
(1791-1860), while still known by the courtesy title of earl of
March, served on Wellington's staff in the Peninsula, being at
the same time member of parliament for Chichester. He was
afterwards a vehement opponent in the House of Lords of
Roman Catholic emancipation, and at a later date a leader of
the opposition to Peel's free trade policy. In 1836, on inheriting
the estates of his maternal uncle, the 5th and last duke of
Gordon, he assumed the name of Gordon before that of Lennox.

On his death in 1860 he was succeeded in his titles by his son
Charles Henry, 6th duke of Richmond (1818-1903), a statesman
who held various cabinet offices in the Conservative administra-
tions of Lord Derby, Disraeli and the marquess of Salisbury;
and who in 1876 was created earl of Kinnaird and duke of Gordon.

These honours in addition to the numerous family titles of more
ancient creation passed on his death in 1903 to his son Charles
Henry Gordon-Lennox (b. 1845), 7th duke of Richmond and
Lennox and 2nd duke of Gordon.

RICHMOND, LEGH (1772-1827), English divine, was born
on the 29th of January 1772, at Liverpool. He was educated
at Trinity College, Cambridge, and in 1798 was appointed to
the joint curacies of Bradling and Yaverland in the Isle of
Wight. He was powerfully influenced by William Wilberforce's
Practical View of Christianity, and took a prominent interest
in the British and Foreign Bible Society, the Church Mis-
sionary Society and similar institutions. In 1805 he became
assistant-chaplain to the Lock Hospital, London, and rector
of Turvey, Bedfordshire, where he remained till his death on
the 8th of May 1827. The best known of his writings is The
Dairyman's Daughter, of which as many as four million in nine-
teen languages were circulated before 1849. A collected edition
of his stories of village life was first published in 1814 under
the title of Annals of the Poor. He also edited a series of Reforma-
tion biographies called Fathers of the English Church (1807-12).
See Memoirs by T. S. Grimshawe (1828); Domestic Portraitu-
tur by T. Fry (1833).

RICHMOND, SIR WILLIAM BLAKE (1842- ), English
painter and decorator, was born in London on the 29th of
November 1842. His father, George Richmond, R.A. (1809-
1866), himself the son of a successful miniature painter, was a
distinguished artist, who painted the portraits of the most eminent
personalities of his day, and played an important part in society.

At the age of fourteen William Richmond entered the Royal
Academy schools, where he worked for about three years. A
visit to Italy in 1859 gave him special opportunity for studying
the works of the old masters, and had an important effect upon
his development. His first Academy picture was a portrait
group (1861); and to this succeeded, during the next three
years, several other pictures of the same class. In 1865 he
returned to Italy, and spent four years there, living chiefly at
Rome. To this period belongs the large canvas, "A Procession
in Honour of Bacchus," which he exhibited at the Academy
in 1869 when he came back to England. His picture, "An
Audience at Athens," was exhibited at the Grosvenor Gallery
in 1885. He became Slade professor at Oxford, succeeding
Ruskin, in 1878, but resigned three years later. He was elected
an Associate of the Royal Academy in 1888 and Royal Acade-
mician in 1895; he received the degree of D.C.L. in 1866, and
a knighthood of the Bath in 1897, and became professor of
painting to the Royal Academy. A part from his pictures, he is
notable for his work in decorative art, his most conspicuous
achievement being the internal decoration and stained-glass
mosaics of St Paul's Cathedral. Sir William Richmond also took
a keen interest in social questions, particularly in smoke-preven-
tion in London.

RICHMOND, a city of Bourke county, Victoria, Australia,
2 m. S.E. of and suburban to Melbourne. It is one of the
pleasantest of the metropolitan suburbs, having numerous parks
and public gardens. There are a number of prosperous industries
in the city. Pop. (1901) 37,772.

RICHMOND, a city and the county-seat of Wayne county,
Indiana, U.S.A., on the E. branch of the Whitewater river,
about 68 m. E. of Indianapolis. Pop. (1890) 16,668; (1900)
18,226, of whom 1497 were foreign-born and 1009 negroes;
(1910 census) 22,324. It is served by the Chicago, Cincinnati
& Louisville, the Grand Rapids & Indiana and the Pittsburg,
Cincinnati, Chicago & St Louis railways, and by the Terre
Haute, Indianapolis, Eastern and the Ohio electric inter-
urban railways. Richmond has broad, well-shaded streets,
various parks, including Glen Miller (130 acres), and has some
public buildings. Its public institutions include the Morrison
Reeves (public) Library (1864), one of the largest (39,000
volumes in 1900) and oldest in the state, an art gallery, the
Reid Memorial Hospital, a Home for Friendless Women, the Margaret
Smith Home for Aged Women (1888), the Wernle Orphans'
Home (1879; Evangelical Lutheran), and the Eastern Indiana
Hospital for the Insane (1890). Just west of the city limits is
Earham College (co-educational), opened in 1847, chartered
in 1859 and controlled by the Society of Orthodox Friends; in
1908-9 it had 30 instructors, 520 students and a library of
18,000 bound volumes. Richmond was for many years the
centre, west of Philadelphia, of the activities of the Society
of Friends. It is an important railway and commercial centre,
RICHMOND

trade in hardware being especially large. Among its manufactures are agricultural machinery (especially seeding machines) and tools, automobiles, pianos, lawn-mowers, roller-skates, foundry and machine-shop products, furniture, burial caskets, and flour. In 1905 its factory product was valued at $6,731,740, an increase of 41.6% since 1900. Pipe lines supply the city with natural gas. The municipality owns and operates the electric-lighting plant. In 1866 Friends from North Carolina and Pennsylvania settled near here, and Richmond was platted in 1816. Its growth was slow until the opening of the National Road, which entered Indiana near the city, and the construction of railways. Richmond was incorporated as a village in 1818 and chartered as a borough in 1834 and as a city in 1840.

RICHMOND, a city and the county-seat of Madison county, Kentucky, U.S.A., about 95 mi. S.E. of Louisville. Pop. (1850) 5073; (1900) 4653, of whom 2087 were negroes; (1910) 3340. It is served by the Louisville & Atlantic and the Louisville & Nashville railw.ays. It is situated in the "Blue Grass Region," near the foothills of the Cumberland Mountains. It is the seat of Madison Institute for girls (1850) and of the Eastern Kentucky Normal College, founded in 1846. For several years the Western Kentucky Central College, which in the latter year was consolidated with Centre College at Danville, Ky. (q.v.).

The surrounding country is devoted largely to the cultivation of tobacco, Indian corn and wheat, and the breeding of fine horses and cattle; and Richmond is an important live-stock market. Among the manufactures are bricks, flour, tobacco, and cigars, and carriages.

On the 30th of August 1862 a Confederate force of about 7000 men under General Edmund Kirby Smith won a decisive victory here over a Union force of nearly an equal number under Generals Mahlon D. Manson (1820-1895) and William Nelson.

RICHMOND, a municipal borough in the Kingston parliamentary division of Surrey, England, 9 mi. W.S.W. of Charing Cross, London. Pop. (1891) 26,875; (1901) 31,672. It lies on the right bank of the Thames, which is here crossed by a bridge carrying the road to Twickenham. Through its pleasant situation Richmond has grown into a large residential suburb of the metropolis. The town was anciently called Syon and afterwards Sheen and Sheen (a name preserved in the village of East Sheen, adjacent on the London side) until the name was in 1300 changed to Richmond by command of Henry VII, who was earl of Richmond in Yorkshire. It grew up round the royal manor house, which became a frequent residence of sovereigns, but of which nothing more than a gateway remains. Edward I. received the Scotch commissioners at his manor of Sheen in 1300. The palace was rebuilt by Edward III., who died here in 1377. It was frequently used by Richard II., and here his wife Anne of Bohemia died, upon which he cursed the place and "caused it to be thrown down and defaced." By Henry V., however, it was rebuilt, and a great tournament was held here in 1492 by Henry VII., who, after its destruction by fire in 1498 restored it. Henry VIII. gave it to Wolsey to reside in, after the latter presented him with the new palace of Hampton Court. James I. settled on it his son Henry, prince of Wales, who restored and embellished it at great expense. Charles I. added to it the new park generally known as Richmond Park, 2253 acres in extent, which is surrounded by a wall 11 m. in length. After the execution of the king the parliament presented the park to the citizens of London, who again presented it to Charles II. at the Restoration. Though partly dismantled, the palace was the residence of the queen dowager till 1665, and by James II. it was used as a nursery for the young prince; but, gradually falling into decay, it was parcelled into tenements about 1720. In the old deer park extending northwards from the site of the palace, Kew Observatory was erected in 1769, occupying the site of a Carthusian convent founded by Henry V., and a dwelling-house in which Swift for some time resided. The White Lodge was built by George I., and has been a residence of various members of the royal family. To the south-east of the town, at the entrance to Richmond Park, is Richmond Hill, from which is seen a famous view of the Thames with the surrounding country to the west. This view was secured to the public by an agreement, sealed on the 7th of February 1866, between the corporation and the trustees of the earl of Dysart, by an act of Parliament of 1902, and by the acquisition in the same year, by the London County Council, with the assistance of the borough of Richmond and other interested local authorities, of the Marble Hill Estate and other property on the Middlesex shore. The church of St Mary Magdalen is of considerable antiquity, but almost entirely rebuilt; it contains a number of monuments to celebrated persons. A theatre, first established in 1719, was during his later years leased by Edmund Kean. The town has a Wesleyan theological college, founded in 1834. Richmond, which was incorporated in 1896, is governed by a mayor, 10 aldermen and 30 councillors. The borough includes Kew (q.v.), Petersham and North Sheen. Area, 2491 acres.

RICHMOND, a market town and municipal borough in the Richmond parliamentary division of the North Riding of Yorkshire, England, 50 m. N.W. from York, the terminus of a branch line of the North-Eastern railway. Pop. (1901) 5046. It is the centre of a group of villages which is the valley of which is narrow and the banks steep. The interest of the town centres in the castle founded about 1271 by Alan Rufus, a son of Odo, count of Penthièvre in Brittany, who is also said to have rebuilt the town on obtaining from William the Conqueror, among other possessions, the estates of the Saxon earl Edwin, embracing some two hundred manors of Richmond and extending over nearly a third of the North Riding. This tract, comprising five wapentakes, was called Richmondshire at this time, but the date of the creation of the shire is uncertain. When Henry VII. came to the throne these possessions reverted to the crown. Henry VIII. gave them to his son Henry, afterwards duke of Richmond, by a daughter of Sir John Blount, and Charles II. bestowed the title of duke of Richmond on his son by the duchess of Portsmouth. The castle is situated on a perpendicular rock rising about 100 ft. above the Swale, and from its great strength was considered impregnable. Originally it covered an area of 5 acres, but the only portions of it remaining are the Norman keep, with pinnacled tower and walls 100 ft. high by 11 ft. thick, and some other smaller towers. The site from the keep is very fine, extending westward up the bold valley and over the hills which wall it, and eastward over the rich plain of the centre of the county. The church of St Mary is transitional Norman, Decorated and Perpendicular, and is largely restored. The church of the Holy Trinity retains only the nave and the detached tower. The building is ancient but was restored to use from ruins. Close to the town are ruins of Easby Abbey, a Premonstratensian foundation by Roald, constable of Richmond Castle in 1152, beautifully situated by the river. The remains, which are considerable, include a Decorated doorway, an Early English chapel and fragments of the transepts and choir of the church, with sufficient portions of the domestic buildings to enable the complete plan to be traced. For the free grammar-school founded by Elizabeth a Gothic building was erected in 1590, in memory of the Rev. James Tate, a former master. The tower of a Franciscan abbey founded in 1258 remains. The chief modern buildings have market hall and the mechanics' institute.

The principal trade is in agricultural produce, but there are a paper mill and an iron and brass foundry. An annual meeting is held on the racecourse in September. In 1886 Richmond became the seat of a suffragan bishop in the diocese of Ripon. The town is governed by a mayor, 4 aldermen and 12 councillors. Area, 2520 acres.

The name of Richmond (Richmonnt, Richmonnd) has not been traced further back than 1145. But it is probable that there was a settlement on the site of the present town before that date. Possibly it was the Hinderlage of the Domesday Survey, a place which, although large enough to have a church in 1086, appears to have vanished before the close of the 12th century. As far as is known the earliest charter was granted in 1145. But a later charter (1146) shows that the burgesses had enjoyed some municipal...
liberties at an earlier period. The charter of 1145 gave the burgesses the borough of Richmond to hold for ever in fee farm at an annual rent of £20. Other charters were granted by Earl Conan in 1130, by Earl John II. in 1268 and by Edward III. (the first royal charter) in 1326, and conferred in subsequent reigns. A charter of incorporation was granted by Queen Elizabeth under the title of aldermen and burgesses in 1576, and another by Charles II. in 1668 under the name of mayor and aldermen. This last, though superseded later, was restored in the reign of James II. and, until the end of the Middle Ages, was sometimes held by the Mayor and Aldermen as the governing charter of the borough. Although Richmond received a summons as early as 1328, it was not represented in parliament until 1584, from which time it usually sent two members. In 1867 the number was reduced to one. Since 1888 the representation has been embodied in the Richmond division of the North Riding. The charter of Earl John II. points to the existence of a market before 1268, but there is no grant of it extant. In 1578, Edward I. granted the same early a year’s fair, and a yearly market be held on the third from the 2nd to the 7th of September inclusive. Queen Elizabeth granted the burgesses a market every Saturday, a market every fortnight for animals and a fair each year on the vigil of Palm Sunday. At one time there appear to have been as many as four annual fairs. There is now one which takes place on the 2nd and 3rd of November. The weekly market is still held on Saturday, and there is a fortnightly market for cattle. In the middle ages Richmond had an important market for corn and wool. There is evidence later of traffic in lead, and also of the manufacture of hand-knitted stockings. As the town possesses the only railway station in Swaledale, the market is still of consequence. But the stocking industry decayed with the introduction of machinery. William the Lion of Scotland was present at the death of Henry II. in 1189, and the town owes its importance chiefly to its lords. The honour was a valuable possession in the middle ages, and it was usually in royal or semi-royal hands.

See R. Gale, Registrum Honoris de Richmond (London, 1722); C. H. Floyd, The History of Richmond (Richmond, 1821); T. D. Whitaker, A History of Richmondshire (London, 1823); Victoria County History, Yorkshire.

RICHMOND, the capital of Virginia, U.S.A., the county-seat of Henrico county, and a port of entry, on the James river (at the head of navigation), about 100 miles S. by W. of Washington, D.C., and about 125 miles by water from the Atlantic Ocean. Pop. (1850) 27,570; (1860) 37,910; (1870) 51,938; (1880) 63,600; (1890) 81,388; (1900) 85,050, of whom 32,230 were negroes and 2865 were foreign-born; (1910) census 127,628. Richmond is served by the Atlantic Coast Line, the Chesapeake & Ohio, the Seaboard Air Line, the Southern and the Richmond, Fredericksburg & Potomac railways, and by the Old Dominion, the Virginia Navigation and the Chesapeake steamship lines. The city has a beautiful situation on the hilly ground (maximum elevation, about 350 ft. above sea-level) along the north and east banks of the James, at a bend where the river changes its south-easterly course for one almost due south. It occupies seven hundred acres, from which fact it is often called the seven hills. The wide curve of the river, opposite the city, breaks into rapids which have a fall of about 116 ft. in 1 m. and provide abundant water power. Belle Isle (the site of a Confederate prison camp during the Civil War), about 1/2 m. long by about 1/2 m. wide, is in part of the river; a little farther down stream are a group of small islets, and opposite the south-eastern boundary of the city is May's Island. Within the city's lines the river is crossed by two bridges (to Manchester) for vehicles and pedestrians, and three railway bridges. The river has been improved by Federal engineers since 1870; in June 1909 (up to which time $1,799,033 had been expended for improvements) there was a channel 100 ft. wide and 18 ft. deep, nearly continuously from Hampton Roads to the Richmond wharf, and the maximum draft at low water was 16 ft.

About three-fourths of the city's total street mileage (120 m.) is paved, and the slab black macadam has been used on principal thoroughfares. The streets 120 to 315 ft. wide are devoted to city parks, among which are William Byrd Park (300 acres), in the western part of the city, Joseph Bryan Park (202-6 acres), Chimborazo Park (240 acres), near its eastern boundary. Gamblers Field (94 acres), Monument Avenue (65 acres), Monument Park (6-3 acres) and Marshall Square (7 acres). The State Capitol Square (10 acres) is not owned by the city. Half a mile N.W. of the city are the Fair Grounds, where a state fair is held annually.

Of Richmond's public buildings, several have great historic interest. St. John's Episcopal church, built in 1740 (and subsequently much enlarged), is noted especially as the meeting-place of the Virginia Convention of March 1775, before which Patrick Henry made a famous speech, ending, "I know not what course others may take, but as for me, Give me liberty, or give me death!" The Capitol (begun in 1785 and completed in 1792—the wings were added in 1906) was designed from a model and plans of the Maison Carrée, at Nîmes, supplied by Thomas Jefferson, while he was minister to France. Aaron Burr was tried for treason and then for misdemeanour in this building in 1807, the Virginia secession convention met here in 1861, and during the Civil War the sessions of the Confederate Congress were held here. In its rotunda is Jean Antoine Houdon’s full-length marble statue of Washington, provided for by the Virginia General Assembly in 1784, and erected in 1796; its base bears a fine inscription written by James Madison. In a niche is a Houdon bust of Lafayette, a replica of the original presented to the city of Paris by the state of Virginia. The Old Stone House (the oldest building in the city) was erected as a residence in 1737, and is now used for a museum. Mason's Hall, whose corner-stone was laid in 1785, is said to be the oldest exclusively Masonic building in the United States. The Executive Mansion of the Confederate States of America, built in 1819, purchased by the city in 1862, and leased to the Confederate government and occupied by President Jefferson Davis in 1862-65, was acquired in 1890 by the Confederate Memorial Library Society, and is now a Confederate Museum with a room for each state of the Confederacy and a general library in the "Solid South" room; it has valuable historical papers, collected by the Southern Historical Society, and the society has published a Calendar of Confederate Papers (1908). The former residence of Chief-Justice John Marshall, built in 1795, is still standing; and the Lee Mansion, which was the war-time residence of General Robert E. Lee's family, has been occupied, since 1893, by the Virginia Historical Society (organized 1831; reorganized 1847) as the repository of a valuable library and collection of portraits of historic interest. Libby Prison, which stood on a northern bank of a canal, near the river, in the eastern part of the city, was taken down in 1888-89, and its materials removed to Chicago, where it was reconstructed, in as nearly as possible its original form, and became the Libby Prison War Museum.1 The Valentine Museum is in a house on Eleventh and Clay Streets, in which Aaron Burr was entertained while he was on trial, and which with $50,000 and his collections was devised to a board of trustees in 1892 by Manu S. Valentine. The museum includes 3300 books, many being of the 15th and 16th centuries, a department of engravings, a Virginia Room with portraits and relics, some tapestries, an excellent collection of casts and valuable American archaeological specimens. The more modern buildings include the City Hall, a fine granite structure (completed in 1893), with a tower 180 ft. tall; the Library building which houses the state library (about 80,000 volumes, with many portraits and a valuable collection of old manuscripts), the State Law Library and also the offices of most of the state officials; the Post-Office and the Post Office; the State Penitentiary; the Chamber of Commerce; and, among the religious edifices, the Sacred Heart Cathedral (Roman Catholic), presented to the city by Mr. and Mrs. Thomas F. Ryan; the Monumental Church, built on the site of the Richmond Theatre, in the burning of which, in 1811, Acting-Governor George W. Smith and fifty-nine others lost their lives; and St. Paul’s Church, where Jefferson Davis was attending services, on the 2nd of April 1865, when he received news from

1 As built in Richmond in 1845 by Luther Libby, it was a brick structure, three stories high in front and four in the rear. It had six rooms, each about 100 X 45 ft., and was a tobacco warehouse and a ship-chandlery until 1861, and then until the capture of Richmond was used as a prison, chiefly for Federal officers. Frequently it was terribly overcrowded (by as many as 1200 prisoners at a time), the inmates often suffered great privations, and many died or were physically disabled for the remainder of their lives.
General Lee that General Grant had broken through the lines at Petersburg and that Richmond must be evacuated. Rosemary Library was given to the city by Thomas Nelson Page in memory of his wife, who died in 1888.

Richmond has many fine monuments and statues of historic interest and artistic merit, the most noteworthy of the former being the Washington Monument, in Capitol Square. In 1850 the commission accepted the model submitted by Thomas Crawford (1814–1857), an American sculptor, the corner-stone of the monument was laid in that year, and the equestrian statue of Washington, with sub-statues of Patrick Henry and Thomas Jefferson, was unveiled on the 22nd of February 1858. Thereafter were added sub-statues of Chief-Justice John Marshall and George Mason (1726–1792) by Crawford, and statues of Andrew Lewis (1730–1801) and Thomas Nelson (1738–1786), and six allegorical subjects, by Randolph Rogers (1829–1892), the monument being completed in 1869, at a cost of about $260,000, of which about $47,000 represented private gifts and the interest thereon. The greatest height of the monument is 60 ft., and the diameter of its base is 86 ft. In Capitol Square are also a marble statue of Henry Clay, by Joel T. Hart (1872–1877), a bronze statue of Stonewall Jackson, by John Henry Foley (1818–1874), an English sculptor, “presented to the city by English gentlemen” (Hon. A. J. Beresford-Hope and others) and unveiled in 1875; a statue of Hunter Holmes McGuire (1835–1900), a famous Virginia surgeon; and a statue of William Smith (1796–1887), governor of Virginia in 1846–49 and in 1864–65. In Monroe Park is a statue by E. V. Valentine of Brig.-General Williams Carter Wickham (1820–1888) of the Confederate army. Another noteworthy monument is the noble equestrian statue of General Robert E. Lee, surmounting a lofty granite pedestal at the head of Franklin Street. This statue, by Marius Jean Antonin Mercié (b. 1845), was unveiled in 1890. Adjacent is an equestrian statue of General J. E. B. Stuart, by Frederick Moynihan, and at the west end of Monument Avenue is the Jefferson Davis Monument, by W. C. Normand, in front of which is a statue of Jefferson Davis, by E. V. Valentine. On Libby Hill, in the south-eastern part of the city, is a monument to the private soldiers and sailors of the Confederacy.

In Hollywood Cemetery (dedicated in 1849) are the graves of many famous men, including presidents James Monroe and John Tyler; Jefferson Davis, John Randolph of Roanoke, the Confederate generals, A. P. Hill, J. E. B. Stuart and George E. Pickett; Commodore Matthew F. Maury (1806–1873); James A. Selden (1815–1886), Secretary of War of the Confederate States in 1862–64; and John R. Thompson (1823–1873), widely known in his day as a poet and as the editor of the Southern Literary Messenger in 1847–59. Here, too, are buried about 16,000 Confederate soldiers (to whose memory there is a massive pyramid of undressed granite, 40 ft. sq. at the base and 90 ft. high). In the north-eastern part of the city is Oakwood Cemetery, in which are the graves of about 16,000 Confederate soldiers, mainly those of Richmond, the National Cemetery, with graves of 6571 Federal soldiers (750 unknown) most of whom were killed in the actions near Richmond.

Richmond is the seat of Richmond College (opened in 1832; chartered in 1840; and co-educational since 1868), which in 1909–10 had 125 instructors and 341 students, of whom 85 were in the School of Law (established 1870; re-established 1890); the Woman's College (Baptist; opened in 1854), which in 1909–10 had 22 instructors and 275 students; the Virginia Mechanics' Institute (1856), including the School of Design; the Virginia Military Institute; the University of the South; and the Seminary in Virginia (Presbyterian; opened in 1824 and removed to Richmond in 1898 from Hampden-Sidney), which in 1909–10 had 7 instructors and 80 students; the Medical College of Virginia, (founded 1838; chartered 1862; and which in 1909–10 had 153 students; the Veterinary Medical College; the College of Jefferson; and the School of Veterinary Medicine); the University of Richmond, founded in 1830; the Virginia Military Institute, in 1839; and the Virginia Theological Seminary, founded 1817.

Many periodicals (including several religious weeklies) are published in Richmond. The principal newspapers are the Times-Dispatch (Democratic; Dispatch, 1850; Times, 1886; consolidated in 1903) and the News-Leader (Democratic, 1890). Among the city's clubs are the Westmoreland and the Commonwealth.

The city's charitable institutions include the Memorial (1905), Virginia Sheltering Arms, for the Aged) and Luke's hospital, the Retreat for the Sick (1877), the Eye, Nose and Throat Infirmary (1880), the Confederate Soldiers' Home (1898), supported jointly by the state and the city, a Home for Needy Confederate Widows (1900), the House of Assistance, and several orphanages and homes for the aged.

Richmond is the leading manufacturing city of Virginia, the value of its factory productions in 1905 being $28,202,607, an increase of 224% since 1900 and nearly 19% of the value of the state's factory productions. Among its distinct products is the manufacture of tobacco for smoking and chewing, of cigars and cigarettes and of snuff. There are large iron and steel works here, notably the Tredegar Iron Works. Other important manufactures, with their value in 1905, were: wooden boxes, $50,805; fancy and paper boxes and wooden packing boxes, $432,522; coffee and spices, $245,689; foundry and machine-shop products, $238,576; and saddlery and harness, $233,839.

Richmond is the port of entry for the District of Richmond; in 1907 its imports were valued at $131,334 and its exports at $158,275; in 1909, its imports at $69,822 and its exports at $24,990. The city has a large jobbing and retail trade.

Richmond is governed under a charter of 1876 with amendments. The mayor is elected for two years and has the powers and authority in criminal cases of a justice of the peace. The city council is composed of a common council (five members from each ward, elected for terms of six years) and members from each ward to be elected for four years). The city council appoints an attorney for the corporation, a city engineer, a police board, a fire board, a board of commissioners and a board of police commissioners, one from each ward, who have control of the fire and police departments, respectively, and a number of other officers. The city owns its gas works, water works, and all the principal public utilities and street lighting. The debt limit is set by the city charter at 18% of the assessed value of the taxable real estate of the city. In 1909 the taxable real estate and personal property was valued at $108,663,716, the city having no floating debt; on the 1st of February 1910, there were $10,706,318 worth of bonds outstanding, and the sinking fund was $2,011,857.

An exploring party from Jamestown, under command of Captain Christopher Newport (c. 1565–1617), and including Captain John Smith, sailed up the James river in 1607, and on the 3rd of June erected a cross on one of the small islands opposite the site of the present city. The first permanent settlement within the present limits of the city was made in 1609 in the district known as Rockett's. Later in the same year Captain Smith bought from the Indians a tract of land on the James river, and 3.5 miles west of this settlement, near the site of the present Powhatan. This tract be named "None-such," and here he attempted to establish a small body of soldiers who had occupied a less favourable site in the vicinity; but they objected to the change and, being attacked by the Indians, sought the protection of Smith, who made prisoners of their leaders, with the result, apparently, that the settlement was abandoned. In 1645 Fort Charles was erected at the falls of the James as a frontier defence. In 1676, during "Bacon's Rebellion," a party of Virginian under Bacon's command killed about 150 Indians who were defending a fort on a hill a short distance east of the site of Richmond in the "Battle of Bloody Run," so called because the blood of the slain savages is said to have coloured the brook (or "ru,") at the base of the hill. Colonel William Byrd, 1 who owned much land along the

1The Byrds and their ancestors, the Steggs, were conspicuous in the early history of Virginia. The first of the family was Thomas Byrde, who settled about 1620 near Virginia, northeast of the Indian trader on the James as early as 1637, and had his home near what is now the village of Westover, Charles City county. He left his estate to his son Thomas (d. 1670), who settled at the falls of the James in 1661, and was auditor-general in 1664-1670. He was succeeded by his nephew, William Byrd (1652–1704), who was born in London, went to Virginia about 1670, became a successful Indian trader, was a member of the House of Burgesses in 1677–1682, was a supporter of Nathaniel Bacon at the beginning of
James river, at the falls, visited the tract in September 1735, and decided to found there the town of Richmond, at the same time selecting and naming the present site of Petersburg. The name Richmond was suggested probably from the name of the land surveyor of the site to that of Richmond, in the Thames. The settlement was laid out in April 1737 by Major William Mayo (c. 1685–1744), and was incorporated as a town in 1742. The public records of the state were removed thither in 1777 from Williamsburg, and in May 1777 Richmond was made the capital. On the 5th of January 1781 the town was partly burned by a force of about 800 British troops under Gen. Benedict Arnold, the zoo or 300 Virginians offering little resistance, and much of the damage being done by Lieutenant-Colonel John G. Simcoe's celebrated Rangers. Richmond was first chartered as a city in 1782, and in 1788 it was allowed a representative in the House of Delegates.

The importance of Richmond during the Civil War was principally due to its having been made the capital of the Confederate States (by act of the Provisional Government on the 8th of May 1861). Its nearness to Washington, the military and manufacturing resources concentrated in it, and the moral importance attached to its possession by both sides, caused it to be regarded as the centre of gravity of the military operations in the east to which the greatest leaders and the finest armies were devoted from 1861 to 1865. (See American Civil War.)

The city's system of defences, which began to take form in May 1861, included a line of 17 heavy batteries, being at an average distance of about a mile, another line of smaller batteries and trenches, from about a mile (or less) to about 2 m. beyond the heavy batteries, and practically unbroken from the north bank of the James (west of the city) to about 1 m. west of that river (south of the city); and the outer works, approximately paralleling the inner line, at distances of from 2 to 3 m. from this line north and east of the city. There was much confusion and lawlessness in Richmond during the earlier stages of the war. The city's police force was unable to cope with the situation created by the influx of soldiers, gamblers and adventurers, and on the 1st of March 1862 President Davis (by authority of a secret Act of the Confederate Congress passed on the 2nd of February) declared martial law in the city and the country within a radius of 10 m., suspended the writ of habeas corpus, and appointed General John H. Winder (1800–1865) to enforce military rule.

General Winder's arbitrary exercise of his powers was, however, resented so vigorously by the citizens that on the 19th of April the Confederate Congress materially modified the law under which he received these powers from the president. The opening of McClellan's Peninsula Campaign (see Yorktown; Seven Days, &c.) in 1862 caused great apprehension in Richmond, and in May 1862 some of the government records were packed up and preparations made to ship them to a place of safety.

The approach of the "Monitor" and the Union gunboats up the James river caused a partial and temporary panic; President Davis appointed a day for prayer, and the families of some of the cabinet members and many citizens fled the city precipitately; but confidence, restored by "Bacon's Rebellion," was audit-general of the colony from 1687 until his death, and a member of the committee which founded the College of William and Mary. His residence, within the limits of the present city of Richmond, was preserved until about 1850. His son William (1674–1744), the founder of Richmond—above referred to—was educated in England; returned to Virginia, in 1716, succeeded his father as auditor-general of the colony, and was receiver-general in 1705–1716. In 1727 he was appointed one of the commission (of which William Fitzwilliams and William Dandridge were the other members) to report the boundary disputes with North Carolina, the determining which he wrote (probably in 1737) The History of the Dividing Line. This with his other publications, A Journey to the Land of Eden and A Progress to the Mines, was published in Petersburg, Va., 1841, and in New York, 1901) as The Writings of Colonial William Byrd of Westover in Virginia, edited by John S. Bassett, and including an extended sketch of the Byrd family. Concerning Byrd's style as a writer, Professor Bassett says: "It would be hard to find before Franklin a better master of the art of writing clear, forceful and charming English.

the checking of the fleet at Drewry's Bluff (Fort Darling), about 8 m. below the city, on the 15th of May 1862, was increased by the battle of Fair Oaks and the Seven Days, after which the Army of the Potomac retreated. Unsuccessful attempts were made in February and March 1864 to free the Federal prisoners in Richmond by means of cavalry raids. The most important of these was that of General H. Judson Kilpatrick, a portion of whose force, under Col. Ulric Dahlgren (b. 1842), was annihilated, Dahlgren being killed (2nd March).

General U. S. Grant began the final campaign against Richmond in May 1864 (see WILDERNESS AND PETERSBURG). Sheridan's cavalry, during the "Richmond Raid," carried the city's outer defences (May 12), but found the river line too strong to be taken by assault and moved away. In June Grant's army crossed the James and attacked Lee in Petersburg. Then followed many months of intermittent pressure upon both Petersburg and Richmond. General Benjamin F. Butler captured the southern outer line of the Richmond defences on the 29th of September 1864. On the 2nd of April 1865 Petersburg fell. Richmond was evacuated that night, after the ironclads, the bridges and many of the military and tobacco store-houses had been set on fire by order of General R. S. Ewell, so that when the Federal troops, under General Godfrey Weitzel (1835–1884) entered the city on the following morning (3rd April) a serious conflagration was under way, which was not extinguished until about one-third of the city, including several of its historic buildings, had been destroyed. During the war the principal iron foundry of the Confederacy (Tredegar Iron Works) was in Richmond, and here most of the cannon used by the Confederate armies were cast. In 1910 the city of Manchester was annexed.

See William W. Henry, "Richmond on the James" in Historic Towns of the Southern States (New York, 1900), edited by Lyman P. Powell; and Samuel Mordecai, Richmond in By-Gone Days (Richmond, 1856; 2nd ed., 1860).

RICHMOND AND DERBY, MARGARET, Countess of (1443–1506), mother of the English king, Henry VII, and foundress of St John's and Christ's colleges at Cambridge, was the daughter and heiress of John Beaufort, duke of Somerset, and was born on the 31st of May 1443. In 1455 she married Edmund Tudor, earl of Richmond, who died in the following year; she then took to her husband Henry (d. 1482), son of Humphrey Stafford, duke of Buckingham, and later Thomas Stanley, afterwards earl of Derby. She was in constant communication with her son, the future king, during his exile in Brittany, and with her husband, Lord Stanley, aided him to gain the crown in 1485. The countess was very pious and charitable, and under the influence of her confessor, John Fisher, afterwards bishop of Rochester, she founded the Lady Margaret professorships of divinity at the universities of Oxford and Cambridge. She completed the foundation of Christ's College, Cambridge, and after her death, in accordance with her wishes, much of her wealth was devoted to building and endowing St John's College in the same university. She survived her son, whose title to the English throne was derived from her, and died on the 29th of June 1509. The countess translated some devotional books into English, and Fisher said of her, "All England for her death had cause of weeping."

See C. H. Cooper, Memoir of Margaret, Countess of Richmond and Derby (1874).
time Miss Stewart resisted the king's importunities, though her behaviour was far from modest and "she had aversion to scandal." She had numerous suitors, including the duke of Buckingham and Francis Digby, son of the earl of Bristol, whose unrequited love for her was celebrated by Dryden. Her beauty appeared to her contemporaries to be only equalled by her childish silliness; but her letters to her husband, preserved in the British Museum, are not devoid of good sense and feeling. The king's infatuation was so great that when the queen's life was despaired of in 1663, it was reported that he intended to marry Miss Stewart, and four years later he was considering the possibility of obtaining a divorce to enable him to make her his wife. This was at a time when Charles feared he was in danger of losing her as his mistress, her hand being sought in marriage by Charles Stuart, duke of Richmond and Lennox. The duchess of Cleveland, who was losing her hold on the king's affections, is reported by Hamilton to have led the king to Miss Stewart's apartment at midnight when Richmond was closeted with her, and the duke was immediately expelled from court. In March 1667 the lady eloped from Whitehall with Richmond and married him secretly in the country. The king, who was greatly enraged, suspected Clarendon of being privy to the match, and, although he was not immediately suspected of this offence. The duchess of Richmond, however, soon returned to court, where she remained for many years; and although she was disfigured by small-pox in 1668, she retained her hold on the king's affections. Her husband was sent as ambassador to Denmark, where he died in 1672. The duchess was present at the birth of the prince of Wales, son of James II., in 1688, being one of those who signed the certificate before the council. She died in 1702, leaving a valuable property to her nephew the earl of Blantyre, whose seat was named Lennoxlove after her.

RICHTER, ADRIAN LUDWIG (1803-1884), German painter and etcher, was born at Dresden in 1803, the son of the engraver Karl August Richter, from whom he received his training; but he was strongly influenced by Erhard and Chodowiecki. He was the most popular, and in many ways the most typical German illustrator of the middle of the 19th century. His work is as typically German and homely as are the fairy-tales of Grimm. Richter visited Italy from 1823-26, and his "Thunderstorm in the Sabine Mountains" at the Staedel Institute in Frankfurt is one of the rare Italian subjects from his brush. In 1828 he worked as designer for the Meissen factory, and in 1840 he became professor and head of the landscape atelier at the Dresden Academy. The Dresden Gallery owns one of his best and most characteristic paintings in the "Bridal Procession in a Spring Landscape." He died at Loschwitz near Dresden in 1884.

RICHTER, ERNST FRIEDRICH EDUARD (1808-1879), German musical theoretician, was born at Grosschonau in Saxony, on the 3rd of October 1808. He first studied music at Zittau, and afterwards at Leipzig, where he attained so high a reputation that in 1843 he was appointed professor of harmony and counterpoint at the conservatoire of music, then newly founded by Mendelssohn. On the death of Hauptmann on the 3rd of January 1848, he was elected cantor of the Thomasschule, which office he retained until his death on the 9th of April 1879. He is best known by three theoretical works—Lehrbuch der Harmonie, Lehre vom Contrapunct und Lehre von der Fuge—valuable textbooks known to English students through the excellent translation by Franklin Taylor.

RICHTER, EUGEN (1839-1906), German politician, was born on the 30th of July 1839 at Dusseldorf. After attending the universities of Bonn, Heidelberg and Berlin, he entered the government service, being stationed in his native town. In 1864 he was chosen burgomaster of Neuwied; but he was already known for his Liberal political opinions, and the government refused to confirm the appointment. He was hereupon transferred to Bromberg, in East Prussia, which is an inhabitant of the Rhine-land was the worst form of exile, and in consequence he resigned his place in the public service. He now went to Berlin, where he earned his living as a journalist. He was the most consistent advocate of those doctrines of laises fare and individual liberty which the Germans call Manchestertum. He was also keenly interested in the attempts made at that period to create co-operative societies among the working men, and wrote a work on co-operative stores. It was not long before he came into conflict with the government; an electioneering pamphlet published in 1867 was confiscated; he was put on his trial but acquitted. In 1867 he was elected a member of the newly formed Reichstag, and in 1869 of the Prussian parliament. He soon became one of the most influential politicians in Germany. A member of the Progressive party, in 1880 one of the founders, and eventually the leader, of the Freisinnige, he was always in opposition. Next to Windthorst (q.v.) he was Bismarck's most dangerous opponent. After the great change of policy in 1878, he took no active part in politics, but devoted himself to the government; as a consistent adherent to free trade, he was the leader of the opposition to the introduction of protection, to the new colonial policy, and to State Socialism. It was after 1880 that he raised the cry Bismarck muss fort. He always took a great part in debates on the military and naval establishments, in vain opposing the constant increase of army and navy. It was his refusal to support the government proposals in 1893 for an increase of the army which led to the break up of his party: he was left with only eleven followers; and, except among the middle class of Berlin and some other Prussian cities, the old Radical party, of which he was the chief representative, from that time had little influence in the country. In 1885 he founded the Freisinnige Zeitung, which he edited himself; of his numerous brochures the most successful was his attack on Socialism, entitled Sozialdemokratische Zukunftsflecker (Berlin, 1891), a clever and successful satire on the Socialist state of the future. This has been translated into the English. He also wrote much on Prussian finance, and under the title Das politische A, B, C Buch company-wide, a work the influence of which he is supposed to have been a factor in bringing about the 1866 war. He also published in 1893 reminiscences of his youth (Jugenderinnerungen), and two volumes of parliamentary reminiscences (Im alten Reichstag, 1894-1896). He died at Jena on the 26th of January 1906.

RICHTER, HANS (1843- ), Hungarian musical conductor, born at Raab on the 4th of April 1843, was the son of the kapellmeister at the cathedral, and of his wife, née Josephine Czainsky, who was the first to perform Venus in Tannhäuser at Vienna. Young Hans sang either soprano or alto in the cathedral choir, according to requirement, and occasionally played the organ. But his public débüt was made as a drummer in Haydn's Poukenmesse. In 1853, at the age of ten, he appeared in a concert as pianist in Hummel's E flat quartet; and in 1854, after his father's death, went to the choristers' school, the Convik (where Schubert was educated) in Vienna, and there became chorister in the Court Chapel. For five years from 1860 Richter studied under Heissler and Sechter in the Vienna Conservatorium, and he learnt the horn under Kleinecke. A year and a half after his first concert in the middle of the year 1866, he devoted time to conducting. It was not till August 1868 that Richter made his first appearance as a conductor, at the Hof Theater, Munich (where he had just been appointed), in William Tell; but in the next year he resigned this post, went first to Paris, then to Brussels, and finally to Triebchen, where he copied Der Ring des Nibelungen for Wagner. In April 1871 Richter took up his new duties as conductor of the Hungarian National Opera at Budapest, where he remained four years, until he began in May 1875 his long connexion with the Vienna Opera, which terminated only with the century. In 1876 Richter
directed the rehearsals and performances of Der Ring at Bayreuth, and in 1877 paid his first visit to England to conduct the Wagner Festival at the Albert Hall. There in 1879 he founded the Richter Concerts, which were a revelation to London musical circles of the masterly personality of the conductor, and his influence upon the orchestra; in 1885 he became conductor of the Birmingham Triennial Festival, and was created Mus. Doc. Oxon. honoris causa. In 1882 Richter also conducted a famous series of performances of Wagner's works (including the first in England of Die Meistersinger and Tristan) at Drury Lane, and in 1900 became conductor of the Hallé Orchestra in Manchester. He had established his position as one of the most richly gifted and the most experienced of modern conductors, supreme in the interpretation of Beethoven, Wagner and Brahms.

RICHTER, JEREMIAS BENJAMIN (1762-1807), German chemist, was born at Hirschberg in Silesia on the 10th of March 1762, became a mining official at Breslau in 1794, and in 1800 was appointed assessor to the department of mines and chemist to the royal porcelain factory at Berlin, where he died on the 4th of April 1807. To him belonged the merit of pointing out some of the earliest determinations of the quantities by weight in which acids saturate bases and bases acids, and of arriving at the conception that those amounts of different bases which can saturate the same quantity of a particular acid are equivalent to each other. He was thus led to conclude that chemistry is a branch of applied mathematics and to endeavour to trace a law according to which the quantities of different bases required to saturate a given acid formed an arithmetical, and the quantities of acids saturating a given base a geometrical, progression. His results were published in his Anfangsgründe der Stöchiometrie oder Messkunst chemischer Elemente (1792-94), and Uber die neueren Gegenstände in der Chemie (1792-1802), but it was long before they were properly appreciated, or he himself was accorded due credit for them. This was partly because some of his work was wrongly ascribed to C. F. Wenzel by Berzelius through a mistake which was only corrected in 1841 by Germain Henri Hess (1793-1870), professor of chemistry at St Petersburg, and author of "the laws of constant heat-sums and of thermoneutrality" (see thermochemistry).

RICHTER, JANN PAUL FRIEDRICH (1763-1825), usually called Jean Paul, famous German humorist, was born at Wunsiedel, in Bavaria, on the 21st of March 1763. His father was a schoolmaster and organist at Wunsiedel, but in 1765 he became a pastor at Joditz near Hof, and in 1776 at Schwarzenbach, where he died in 1779. After attending the gymnasium at Hof, Richter went in 1781 to the university of Leipzig. His original intention was to enter his father's profession, but theology did not interest him, and he soon devoted himself wholly to the study of literature. Unable to maintain himself at Leipzig he returned in 1784 to Hof, where he lived with his mother. From 1787 to 1789 he served as a tutor at Töpen, a village near Hof; and afterwards he taught the children of several families at Schwarzenbach.

Richter began his career as a man of letters with Gründliche Ausführungen aus des Teufels Papieren, the former of which was issued in 1783-84, the latter in 1789. These works were not received with much favour, and in later life Richter himself had little sympathy with their satirical tone. His next book, Die unsichtbare Loge, a romance, published in 1793, had all the qualities which were soon to make him famous, and its power was immediately recognized by some of the best critics of the day. Encouraged by the reception of Die unsichtbare Loge, he sent forth in rapid succession Herzstoss (1795), Biographische Beleustigungen unter der Gehirnsache einer Riesin (1796), Leben des Quintus Fixelin (1796), Blumen- Frucht- und Dornenstücke, oder Ehestand, Tod und Hochzeit des Arnemadokuten Siebenhür (1796-97), Der Judenalien (1797), and Das Kampaner Tal (1799). This series of writings won for Richter an assured place in German literature, and during the rest of his life every work he produced was welcomed by a wide circle of admirers.

After his mother's death he went in 1797 to Leipzig, and in the following year to Weimar, where he had much pleasant intercourse with Herder, by whom he was warmly welcomed. He did not become intimate with Goethe and Schiller, to both of whom his literary methods were repugnant; but in Weimar, as elsewhere, his remarkable conversational powers and his genial manners made him a favourite in general society. In 1801 he married Caroline Meyer, whom he met in Berlin in 1800. They lived first at Meiningen, then at Coburg; and finally, in 1804, they settled at Bayreuth. Here Richter spent a quiet, simple and happy life, constantly occupied with his work as a writer. In 1808 he was fortunately delivered from anxiety as to outward necessities by the prince-primate, K. von Dalberg, who gave him a pension of a thousand florins. Before settling at Bayreuth, Richter had published his most ambitious novel, Titan (1800-3); and this was followed by Fliegelerjahre (1804-5), two works which he himself regarded as his masterpieces. His later imaginative works were Dr Katebensbergs Baderesise (1809), Der Feldpredigers Schmelze Reise nach Plauen (1809), Leben Fibels (1812), and Der Komet, oder Nikolaus Marias (1820-1). In 1812 he published Vorlesungen über die Gestirne, in which he expounded his ideas on art; he discussed the principles of education in Levana, oder Erziehungskun (1807); and the opinions suggested by current events he set forth in Friedenspredig (1868), Dämmerungen für Deutschland (1809), Mars und Phobus Throneuch in das Jahre 1812 (1814), and Politische Fastenpredigten (1817). In his last years he began Wahrheit aus Jean Pauls Leben, to which additions from his papers and other sources were made after his death by C. Otto and E. Förster. In 1821 Richter lost his only son, a youth of the highest promise; and he never quite recovered from this shock. He died of dyspny, at Bayreuth, on the 14th November 1825.

Schiller said of Richter that he would have been worthy of admiration "if he had made as good use of his riches as other men made of their poverty." And it is true that in the form of his writings he never did full justice to his great powers. In works of his later years he sometimes confused his ideas, and it might have been less difficult to resist the expression of any powerful feeling by which he might have been moved. He was equally unable to resist the temptation to bring in strange facts or notions which occurred to him. Hence every one of his works is irregular in structure, and his style lacks directness, precision and grace. But his imagination was one of extraordinary fertility, and he had a surprising power of suggesting great thoughts by means of the simplest incidents and relations. The love of nature was one of Richter's deepest pleasures; his expressions of religious feelings are also marked by a truly poetic spirit, for to Richter visible things were but the symbols of the invisible, and in the unseen realities alone he found elements which seemed to him to give significance and dignity to human life. His humour, the most distinctive of his qualities, cannot be dissociated from the other characteristics of his writings. It mingled with all his thoughts, and to some extent determined the form in which he expressed them. He was sometimes extravagant and grotesque cannot be disputed, but it is never harsh nor vulgar, and generally it springs naturally from the perception of the incongruity between ordinary facts and ideal laws. Richter's personality was deep and many-sided; with all his wilfulness and eccentricity he was a man of a pure and sensitive spirit, with a passionate scorn for pretence and an ardent enthusiasm for truth and goodness.

Richter's Sämtliche Werke appeared in 1826-28 in 60 vols., to which were added 5 vols. of Literarischer Nachlass in 1836-38; a second edition was published in 1840-42 (33 vols.); a third in 1860-62 (34 vols.). The last complete edition is that edited by R. Gottel (50 parts, 1879). Editions of selected works appeared in 16 vols. (1865), in Kürschner's Deutsche Nationalliteratur (edited by P. Nerrlich, 6 vols., 1884-87), &c. The chief collections of Richter's correspondence are: Jean Pauls Briefe an F. J. Jacobi (1828); Briefwechsel Jean Pauls mit seinem Freund C. Otto (1829-33); Briefwechsel zwischen H. von O. und Jean Paul (1833); Briefe an eine Jugendfreundin (1858): P. Nerrlich, Jean Pauls Briefwechsel mit seiner Frau und seinem Freund Otto (1902). See further
the continuation of Richter's autobiography by C. Otto and E. Förster (1826–33); H. Döring, J. P. F. Richter's Leben und Charak- teristik (1830–32); R. O. Spazier, J. P. F. Richter: ein biogra- phischer Kommentar zu dessen Werken (5 vols., 1853); E. Förster, Die Beziehungen aus dem Leben (1859); Felix von Luscher, P. Nerrlich, Jean Paul and seine Zeitgenossen (1876); J. Firmery, Étude sur la vie et les œuvres de J. P. F. Richter (1886); P. Nerrlich, Jean Paul, sein Leben und seine Werke (1889); F. J. Schneider, Jean Pauls Allersichtung (1901); by the same, Jean Pauls Jugend und seine erste Ästhetische Literatur (1906). All Richter's more important works have been translated into English, Quintus Fuscine and Schimdes Reise, by Carlyle; see also Carlyle's two admirable essays on Richter.

RICHTOFEN, PERNAND, BARON VON (1833–1909), German geographer and traveller, was born near Karlsruhe, Silesia, on the 4th of May 1833. He was educated at Breslau and Berlin, and in 1856 carried out geological investigations in the Tirol, subsequently extending them to Transylvania. In 1859 he accompanied as geologist the Russian diplomatic mission to the Far East and and visited Ceylon, Japan, Formosa, the Philippines and Java, subsequently making an overland journey from Bangkok to Moulimein and reaching Calcutta in 1862. No important work resulted from these travels, for much of Richtofen's records and collections was lost. China was at the time inaccessible owing to the Taiping rebellion, but Richtofen was impressed with the desirability of exploring it, and after a visit to California, where he remained till 1868, he returned to the East. In a remarkable series of seven journeys he penetrated into almost every part of the Chinese Empire. He returned home in 1872, and a work comprising three large volumes and an atlas, which, however, did not cover the entire field or complete the author's plan, appeared at Berlin in 1877–85 under the title of China; Ergebnisse eigner Reisen und darauf gegründeter Studien. In this standard work the author deals not only with geology but with every subject necessary to a general geographical treatment of the region he traversed; he wrote a valuable series of letters to the Shanghai Chamber of Commerce, and first drew attention to the importance of the coalfields of Shantung, and of Kiao-chow as a port. In 1875 Richtofen was elected professor of geology at Bonn, but being fully occupied with his work in China he did not take up professorial duties till 1879; in 1883 he became professor of geology at Leipzig, and in 1886 was chosen to the same office at Berlin, and held it till his death. His lectures attracted numerous students who subsequently became eminent in geographical work, and in order to keep in touch with them he established his weekly geographical "colloquium." Of his written works, besides that on China, there may be men- tioned "Die Kalkalpen von Vorarlberg und Nordtirol" in Jahrh Lynch. der geologischen Reichsanstalt (1859-1860); "Die Metallproduktion Kaliforniens" in Petermanns Mitteilungen (1859); "Natural System of Volcanic Rocks" (San Francisco, 1867); Aufgaben und Methoden der heutigen Geographie (an address delivered at Leipzig, 1883); Führer für Forschungs- reisende (Berlin, 1886); Triebkräfte und Richtungen der Erdbewegungen neunzehnten Jahrhunderts (address on his election as rector, Berlin, 1903). He was for many years president of the German Geographical Society, and he founded the Berlin Hydrographical Institute. He died on the 16th of October 1905.

RICIMER (d. 472), master of the Roman Empire in the West during part of the 5th century, was the son of a prince of the Suebi and the daughter of Wallia, king of the Visigoths. His youth was spent at the court of Valentinian III., and he won distinction under Aetius. In 436 he defeated the Vandals in a sea-fight near Corsica, and on land near Agrigentum in Sicily, and backed by the popularity thus acquired, Ricimer then gained the consent of the Roman senate to turn the imperial power against the emperor Avitus, whom he deposed in a bloody battle at Piacenza on the 16th of October 436. Avitus was taken prisoner and made bishop of Piacenza, and shortly afterwards sentenced to death. Ricimer then obtained from Leo I., emperor at Constantinople, the title patrician, but in 437 set up Majorianus as his own emperor in the West, and induced Leo to give his consent. When, however, Majorianus tried to rule by himself, Ricimer forced him to abdicate and caused his assassination on the 7th of August 461. The successor whom Ricimer placed upon the throne was Libius Severus, who proved to be more docile than Majorianus, but had to face the rivalry of Leo in the East and Aegidius in Gaul. Upon his death in 465—said to be due to the poison of Ricimer—this emperor-maker ruled the West for eighteen months without an emperor, and then accepted Leo's candidate Anastheus, diplomatically married his daughter, and for some time lived in peace with him. Before long, however, Ricimer moved to Milan, ready to declare war upon Anastheus. St Ephipanius, bishop of Milan, patched up a truce, but in 472 Ricimer was again before Rome with an army of Germans, proclaimed as emperor Olybrius, whom Leo had sent to pacify the two enemies, and after three months' siege took the city, on the 1st of July 472. Anastheus was massacred and Rome was a prey to Ricimer's soldiers. He himself, however, died on the 18th of August 472, of malignant fever.

RICINA, an ancient town of Picenum, Italy, 3 m. N.W. of the modern Macerata, on the banks of the river Potenza, in a fertile valley. It was probably a municipium until it was refounded by Pertinax and Septimius Severus, after which it bore the name Colonia Helvia Ricina Pertinax. The site is now deserted, but considerable ruins of a theatre and remains of baths and other buildings (all in brickwork of the imperial period) still exist; also the fragments of an ancient bridge over the Potenza.

RICKETS, a constitutional disease of childhood characterized chiefly by a softened condition of the bones and by other evidences of perverted nutrition. It was first described in 1649 by Arnold de Boor, a Frisian physician practising in Ire- land. It is caused by the imperfect calcification of the infant bones, Diseases. The name "rickets" is from the Old English wrickken, to twist; the more technical medical term, rachitis, which comes from Greek ῥάξιτος, the spine, was suggested by Francis Glisson in 1650, both from similarity of sound and from the part of the body which is one of the first to be affected. Rickets can seldom be recognized until several months after birth, and it most commonly attracts attention at about the end of the first year. The symptoms which precede the out- ward manifestation of the disease are marked disorders of the digestive and alimentary functions. The child's appetite is diminished, and there is frequent vomiting, together with diarrhoea or irregularity of the bowels, the evacuations being clay-coloured and unhealthy. Along with this there is a falling away in flesh. Importance is to be attached to certain other symptoms present in the early stages, namely, profuse sweating of the head and upper parts of the body, particularly during sleep, with sometimes the same time dry heat of the lower parts and a tendency in the child to kick off all coverings and expose the limbs. At the same time there is great tenderness of the bones, as shown by the pain produced on moving or handling the child. Gradually the changes in the shape of the bones become visible, at first chiefly noticed at the ends of the long bones, as in those of the arm, causing enlargements at the wrists, or in the ribs, producing a knobbled appearance at the junction of their ends with the costal cartilages. The bones also from their softened condition tend to become distorted and misshapen, both by the action of the muscles and by the superincumbent weight of the body. Those of the limbs are bent outwards and forwards, and the child becomes "bow- legged" or "in-kneed" often to an extreme degree. The trunk of the body likewise shows various alterations and deformities owing to curvatures of the spine, the flattening and the curvatures of the rib-cage of the ribs, and the projection forwards of the sternum. The cavity of the chest may thus be contracted and the development of the thoracic organs interfered with as well as their functions more or less embarrassed. The pelvis undergoes distortion, which may reduce its capacity to a
RICKMAN—RICOCHET

degree that in the female may afterwards lead to serious difficulties in parturition. The head of the rickety child is large, long, and flat, the upper part, the individual bones of the cranium sometimes remaining long ununited, while the face is small and ill-developed, and the teeth appear late and fall out or decay early. The constitutional conditions of ill-health continue, and the nutrition and development of the child are greatly retarded.

The disease may terminate in recovery, with more or less of deformity and dwarfishness, the bones although altered in shape, are generally ossified, and the cause common to the majority of instances. On the other hand, during the progress of the disease, various intercurrent ailments are apt to arise which may cause death, such as the infectious fevers, bronchitis and other pulmonary affections, chronic hydrocephalus, convulsions, laryngismus stridulus, &c.

An acute form of rickets of rare occurrence (really a form of scurvy, q.v.) has been described by writers on diseases of children, in which all the symptoms are of more rapid development and progress, the result in many instances being fatal.

The treatment of rickets is necessarily more hygienic than medicinal, and includes such preventive measures as may be exercised by strict attention to personal health and nutrition on the part of mothers, especially where there appears to be any tendency to a rickety development in any members of the family. Very important also is the avoidance of too prolonged nursing, which by its weakening effects upon the mother's health is calculated to engender the disease in any succeeding children. At the same time it must be admitted that, when the mother is healthy, her milk abundant, and nursing discontinued before the lapse of the first year, there is no better means of preventing the occurrence of rickets than this method of feeding an infant, the disease, as is well known, being far more frequently met with in children brought up by hand. The management of the child exhibiting any tendency to rickets is of great importance, but can only be alluded to in general terms. The digestive disorders characteristic of the setting in of the disease render necessary the greatest care and watchfulness as to diet. Thus, if the child be not nursed but fed artificially, fresh milk should be almost the only article of diet for at least the first year, and the chief element for the next. When not digested well, as may at times be shown by its appearance as a curd in the evacuations, it may be diluted with water or lime-water, or else discontinued for a short time, carefully-made gruel or barley water being substituted. Many of the so-called "infants' foods" which are now so extensively used appear to be well adapted for their purpose, but when employed too abundantly and to the exclusion of the due amount of milk are often productive of digestive and intestinal disorders, probably from their containing a greater amount of starchy matter than can be utilized. From the end of the first year light animal soups may occasionally be given with advantage. The medicinal remedies most to be relied on are those which improve the digestive functions and minister to nutrition, and include such agents as the preparations of iron, quinine, and especially cod-liver oil and phosphorus, and the cautious use of extract of thyroid gland has been advocated by Henoch. Of no less importance, however, are abundance of fresh air, cleanliness, warm clothing, and attention to the general hygiene of the child and to regularity in all its functions.

When the disease is showing evidence of advancing, it is desirable to restrain the child from walking, as far as possible. But this precaution may be to some extent rendered unnecessary by the use of splints and other apparatus as supports for the limbs and body, enabling the child to move about without the risk of bending and deformity of the bones which otherwise would probably be the result.

The condition formerly known as foetal rickets (achondroplasia or chondrodystrophy foetalis) is now classed as a separate disease. Its chief characteristics are dwarfishness with shortening of the limbs and enormous enlargement of the articulations.

RICKMAN, THOMAS (1776-1841), English architect, was born on the 8th of June 1776 at Maidenhead, Berkshire, where he assisted his father (a Quaker) in business as a grocer and druggist until 1797. He was then engaged in various businesses until 1818. All his spare time was spent in sketching and making careful measured drawings, till he gained a knowledge of architecture which was very remarkable at a time when little taste existed for the beauties of the Gothic styles. In 1811 alone he is said to have studied three thousand ecclesiastical buildings. When in 1818 a large grant of money was made by the government to build new churches, Rickman sent in a design of his own which was successful in an open competition; thus he was fairly launched upon the profession of an architect, for which his natural gifts strongly fitted him. Rickman then moved to Birmingham, and by 1830 became one of the most successful architects of his time. He built churches at Hampton Lucy, Ombesley, and Stretton-on-Dunsmore, St George's at Birmingham, St Philip's and St Matthew's in Bristol, two in Carlisle, St Peter's and St Paul's at Preston, St David's in Glasgow, Grey Friars at Coventry, and many others. He also designed the new court of St John's College, Cambridge, a palace for the bishop of Carlisle, and several large country houses. These are all in the Gothic style, but show more knowledge of the outward form of the medieval style than any real acquaintance with its spirit, and are little better than dull copies of old work, disfigured by much poverty of detail. Rickman nevertheless played an important part in the revival of taste for medievalism perhaps second only to Pugin. His Attempt to discriminate the Styles of Architecture in England shows pains-taking research, and ran through many editions. Rickman died at Birmingham on the 4th of January 1841. He was married three times: first to his cousin, Lucy Rickman of Lewes; secondly to Christiana Hornor; thirdly to Elizabeth Miller of Edinburgh, by whom he had a son and a daughter.

RICKMANSWORTH, an urban district in the Watford parliamentary division of Hertfordshire, England; 173 m. W.N.W. of London by the Metropolitan & Great Central joint railway; served also by a branch of the London & North Western railway from Watford. Pop. (1901) 5627. It lies in a pleasant valley at the junction of the Chess with the Colne, and on the Grand Junction canal. The church of St Mary, with the exception of the tower a modern reconstruction, contains some French stained glass of the 16th century. The chief industries are brewing and art-printing. The Colne here holds large trouts, which are carefully preserved. The grounds of Moor Park to the south-east are finely wooded, and the mansion, belonging to Lord Ebury, is a good example of the period of George I. The estate counts among its former owners such famous names as the Botlers; George Neville, archbishop of York; John de Vere, earl of Oxford in Henry VII's time; Wolsey in the next reign; Robert Carey, earl of Monmouth, and the duke of Monmouth.

RICOCHET, a military term expressing the rebound of a projectile that strikes on a hard surface. The origin of the French word ricochet is unknown. Its earliest known use (14th and 15th centuries) was in the sense of "repetition," e.g. chanson du ricochet, "an oft-told tale." Hence it came to be applied to the rebound of a flat stone skinned along the surface of water, known familiarly in English as "ducks and drakes," and so finally in the military sense defined above, which found its way into the English language.

The use of the now obsolete "ricochet fire" in war is well illustrated by "ducks and drakes." The shot, striking the ground at a small angle, described for the remainder of its course a succession of leaps and falls. The discovery of this species of fire, usually attributed to Vauban (siege of Ath in 1697), had the greatest influence both on sieges and on operations in the field. In siege warfare, ricochet, especially when combined with enfilade, i.e. when directed along the enemy's line of defence, soon became the principal weapon of the besieger, and with the system of parallels (q.v.) gave the attack a superiority so complete that a siege came to be considered as the most
certain operation of war. Enfilade fire by itself was neutralized by traverses (g.t.) in the defences, but by the new method a shot could be so aimed as to skip over each successive traverse and thus to search ground that was immune from direct fire. The application of ricochet fire to operations in the field came somewhat later. In the 18th century field artillery, which was not, before Napoleon's time, sufficiently mobile to close with the enemy, relied principally upon the ricochet of round shot, which, sweeping a considerable depth of ground, took effect upon several successive lines of hostile troops. But once artillery was able to gallop up to the enemy and to use its far more formidable close-range projectile, case-shot, ricochet fire came to be used less and less, until finally, with the general adoption of shell (which, of course, burst at the first contact with the ground), the round shot disappeared altogether from the battlefield. Similarly in siege warfare, as soon as high-angle fire with shells became sufficiently accurate, there was no further need of round shot and ricochet.

The term "ricochet" is now only applied, in modern nile shooting, to the graze of a bullet that has struck short. A modern bullet that has ricocheted inflicts a very severe wound, as its nickel or other hard material is torn and jagged on contact with the ground. With its high remaining velocity it is dangerous even after more than one ricochet, except at extreme ranges.

RICOLD OF MONTE CROCE (1247-1320), Italian Dominican missionary, was born at Monte Croce, near Florence. In 1267 he entered the Dominican house of Santa Maria Novella in Florence, and in 1272 that of St Catherine in Pisa. He started for Acre with a papal commission to preach in 1286 or 1287; in 1288 or 1289 he began to keep a record of his experiences in the Levant; this record he probably reduced to final book form in Bagdad. Entering Syria at Acre, he crossed Galilee to the Sea of Tiberias; thence returning to Acre he seems to have travelled down the coast to Jaffa, and so up to Jerusalem. After visiting the Jordan and the Dead Sea he quitted Palestine by the coast road, retracing his steps to Acre and passing on by Tripoli and Tortosa into Cilicia. From the Cilician port of Lajazzo he started on the great road to Tabriz in north Persia. Crossing the Taurus he travelled on by Sivas to Gopardia to Erzerum, the neighbourhood of Ararat and Tabriz. In and near Tabriz he preached for several months, after which he proceeded to Bagdad via Mosul and Tekrit. In Bagdad he stayed several years, studying the Koran and other works of Moslem theology, for controversial purposes, arguing with Nestorian Christians, and writing. In 1301 Ricold again appeared in Florence: some time after this he proposed to submit his Confutatio Alcorani to the pope, but did not. He died on the 31st of October 1320. As a traveller and observer his merits are conspicuous. His account of the Tartars and his sketch of Moslem religion and manners are especially noteworthy. In spite of strong prejudice, he shows remarkable breadth of view and appreciation of merit in systems the most hostile to his own.

RICOTTI-MAGNANI, CESARE (1822-1897), Italian general and knight of the Annunziata, was born at Borgo Lavezzaro on the 30th of June 1822. As artillery lieutenant he distinguished himself and was wounded at the siege of Peschiera in 1848, and in 1852 gained further distinction by his efforts to prevent the explosion of a burning powder magazine. After serving from 1856 to 1859 as director of the Artillery School, he became general of division in 1864, commanding the 4th division at the battle of San Martino. In the war of 1866 he stormed Borgoforte, to open a passage for Cialdini's army. Upon the death of General Govone in 1872 he was appointed minister of war, and after the occupation of Rome bent all his efforts to arm reform, in accordance with the lessons of the Franco-German War. He shortened the period of military service; extended conscription to all able-bodied men; created a permanent army, a mobile militia and a reserve; commenced the renewal of armaments; and placed Italy in a position to put 1,500,000 men on a war footing. Ricotti fell from power with the Right in 1876, but returned to office with Depretis in 1884, and amended his previous scheme of reform. Resigning in April 1887, he became a member of the senate in 1890, but took little part in public life until 1896, when, after the battle of Adowa, he was entrusted by King Humbert with the formation of a cabinet. Having constructed his ministry, he made over the premiership to the marquis di Rudini, retaining for himself the portfolio of war, and seeking to satisfy public demands for the reduction of military expenditure by consolidating the tactical structure of the army without weakening its fighting power. Rudini, however, finding that Ricotti's ideas, which he himself shared, were not acceptable at court, obliged him to resign office. His prestige as creator of the modern Italian army remained unimpaired, and his views on army organization enjoyed a large measure of technical and public favour.

RIDDING, GEORGE (1828-1904), English headmaster and bishop, was born at Winchester College, of which his father, the Rev. Charles Ridding, vicar of Andover, was a fellow, on the 16th of March 1828. He was educated at Winchester and at Balliol College, Oxford. He became a fellow of Exeter College and was a tutor from 1853 to 1863. In 1853 he married Mary Louisa Mobberly, who died within a year of her marriage. He was appointed second master of Winchester College in 1863, and on the retirement of his father-in-law, Dr Mobberly, he succeeded to the headmastership. During the tenure of this oflice (1867-1884) he carried out successfully a series of radical reforms in the organization of the school, resulting in a great increase both in its reputation and numbers. In 1884 he became the first bishop of Southwell, and brought his powers of organization and conspicuous tact and moderation to bear on the management of the new diocese. He took an active share in its educational and social work, and was materially assisted in these respects by his second wife, Lady Laura Palmer, daughter of the 1st earl of Selborne. He resigned his see a short time before his death, which took place on the 30th of August 1904. See Church Quarterly Review (July 1905).

RIDDLES (A.S. raedan, to interpret), probably the oldest extant form of humour. They spring from man's earliest perception that there are such things as analogies in nature. Man observes an example of analogy, puts his observations in the form of a question, and there is the riddle ready made. Some Boeotian humorist, for example, detected the analogy between the life of a man and the life of a bean; he then enunciated the analogy that on all fours, the men erect on two legs, old age with its staff—one on side, and on the other the conception of an animal with a varying number of limbs. Put this in a question and it is the riddle of the Sphinx. Another instance is the question, "What we caught we threw away, what we could not catch we kept." Homer is said to have died of vexation at not being able to discover the answer to this riddle, still current on the coast of Brittany, in Germany and in Gascony. After inventing the riddle, men began to use it in a kind of game; bets were staked on the answer and sides were made, each side backing its champion. These sports in Marriner's time were common in Tonga; they are no less popular among the African Wolofos. Samson's riddle set to the Philistines is an instance of the sport in a Semitic country. In märchen and ballads, the hero's chance of
Winning his beloved, or of escaping threatened punishment, is often made to turn on his power of answering riddles. It follows from the artless and primitive character of the riddle that regular popular riddles (Destinées) are widely distributed, like popular tales, popular songs and popular customs. The Wolfs ask, “What flies for ever, and rests never?” Answer, The wind. The Basutos put this riddle, “What is wingless and legless, yet flies fast and cannot be imprisoned?” Answer, The voice. The German riddle runs, “What can go in face of the sun yet leave no shadow?” Answer, The wind. In riddles may perhaps be noticed the animistic or personalizing tendency of early human thought, just beginning to be conscious of itself. The person who asked these riddles had the old sense of wind, for example, as a person, yet probably, unlike the bushmen, he would never expect to see the personal wind. He knew the distinction between the personal and impersonal well enough to be sure that his enigma would present some difficulty. The riddle, to be brief, is an interrogatory form of the fable, and like the fable originates among rude people, and is perpetuated in the folklore of peasantry.

The only best book on the riddle (a subject less frequently studied than the riddle or enigma) is Eugène Rolland, Destinées ou enigmes populaires, with a preface by M. Gaston Paris. The power of answering riddles among the people who invented the legend of Solomon and the queen of Sheba seems to have regarded as a proof of great sagacity. The riddle proper is all but extinct outside folklore and savage life, and has been replaced by the conundrum, which is a pun in the interrogative form.

Old English Riddles.—A number of interesting poetical riddles in old English are contained in the Exeter Book, written about A.D. 1000. According to the numbering in the only complete edition (in Lipps’s Einhorn, Berliner der Anglistischen Zeitschrift, vol. iii., pp. 184–238), there would appear to be 95 of them; but No. 1 is the monodramatic lyric Wulf and Eadweard, which was included among the riddles by a mistake of the first editor of the Exeter Book; but No. 25 is not in Old English, but in Latin; and several others are mere unintelligible fragments. There remain about 85 that have been preserved either entire or with sufficient approach to completeness for their general drift to be perceived.

The riddles Nos. 2–60 occupy 15 folios in the middle of the MS.; Nos. 62–95 occupy the last 7 folios, and No. 61 and a mutilated and divergent copy of No. 31 are placed by themselves among poems of a different kind. Attempts have been made to show that the two groups are not homogeneous. The supposed homogeneity of the other characteristics that may indicate difference of authorship or date; but there seems to be no good reason for attaching any significance to the arrangement of the MS. Some of the riddles almost certainly were composed in Anglo-Saxon England in the 10th century, a copy of one of them (No. 36), in Anglian dialect, has been preserved in a MS. at Aberdeen. Whether all the riddles are the work of one author, or whether they belong to different periods and districts, remains at present uncertain. For the reasons stated in the article Cynwulf, the attribution of the whole collection to that poet, once universally accepted, is now no longer tenable; and there is no overwhelmng probability that he is the author of any portion of it.1

The investigations of F. Dietrich and A. Ebert have established the fact that a few of the riddles are imitated from the Latin enigmas of Symposius and Aldhelm. No. 36 is a translation of Aldhelm’s riddle De Lortca, and No. 41 is founded on the same writer’s riddle De Bicuda. Many of the Irish Christian riddles of the earliest writers has, however, been greatly exaggerated, especially by A. Prehn (Komposition und Quellen der Rätsel des Exeterbuches, 1883), who goes so far as to maintain that every one of them contains reference to some or other of the episodes of the lives of Saints or Apostles, of the times or of the writings of Symposius, Aldhelm, Tatwine and Eusebius. The correspondences alleged are in most cases slight, if not purely fanciful, and it is even doubtful whether the two writers last named were known at all to the authors of the Exeter Book. All the more remarkable is the number of the 8th and following centuries, whether they wrote in their native tongue or in Latin, may be said to belong to one school, and their work has many features in common. But except in a few instances the riddle is an innovation in the mid-Early English, but more original than those written in Latin. In poetic merit they are generally superior. A good notion of their character and style may be gained from Mr Stoford Brooke’s spirited and not minutely accurate) translations of many of them in his History of Early English Literature, vol. i. (1892). Mr Brooke’s interpretation of No. 11 (the Barnacle Goose) is original, and no doubt correct: in some other instances the solutions he has adopted are somewhat more questionable than they would appear to be from his translation.

Unlike the Latin riddles of Aldhelm, the riddles of the Exeter Book are unaccompanied with solutions. In some of them, however, the answer is indicated by an anagram, usually in runic letters. The Exeter Book leaves written within the word “Agos” my name reversed,” where the Welsh Saxon scrawled an inscription with the phonetic laws of his own dialect, has substituted F for the final B of his Anglian original; the word is an anagram of boga.

In No. 25 the mimic skill of the magpie is described, and at the conclusion the name of the bird (bingo) is indicated by the six letters G, A, R, O, H, I.

The solution of nearly all the riddles was attempted by F. Dietrich, in the 11th and 12th volumes of Haupt’s Zeitschrift für deutsches Alterthum (1887–97). In many cases Dietrich was certainly right, in many others his conjectures are strangely perverse, having to misleading comparisons with supposed Latin originals. Subsequent scholars have been much more successful in refuting Dietrich’s palaeography than in replacing them by others more satisfactory. The most copious contributor of new interpretations has been Prof. M. Trautmann, in several articles in Anglia, and also in Bommer, Beiträge zur Anglistik, No. 19 (1905): but very few of his interpretations can be considered even plausible, and he sometimes rejects the solutions of his predecessors when they are probably right.

One riddle (No. 51, Fire) was independently solved by Prof. Trautmann and G. Herbst (Die Rätsel des Exeterbuches und ihr Verfasser, 1890), who was also the first to translate and illustrate some of the modern riddles, with remarks on their derivation in Modern Philology, vol. ii. (1903), and in Modern Language Notes for 1903 and 1906, are extremely valuable, though the author’s original explanations do not appear convincing. After all that has been done, there remains a large number of riddles that are still uncertain. In some instances this may be due to the corrupt state of the text; in others the terms in which the object is described are so vague that several solutions are equally plausible. (H. Br.)

RIDGE, William Pett (1864– ). English author, was born at Chatham, near Canterbury, and was educated at Marden, Kent, and at the Birkbeck Institute, London. He was for some time a clerk in the Railway Clearing House, and began about 1891 to write humorous sketches for the St James’s Gazette and other papers. He secured his first striking success, in volume form, with Moral Emly (1898), an excellent example of his ability to draw his portraits of lower class life.

His later books include A Son of the State (1899), A Break of Laws (1900), Lost Property (1902), Erb (1903), Mrs Caler’s Business (1905), The Wickhams (1906), &c.

Ridge (a word, common to many Teutonic languages, meaning “back,” whether of a man or an animal, cf. German Rücke), the word applied to many objects resembling the projecting line of an animal’s back, such as the strip of soil thrown up by a plough between furrows, the elevations or protuberances on bones which serve for the attachment of muscles or ligaments, &c. In architecture the ridge (Fr. faise, crible; Gr. First; Ital. asinello) is the highest portion of a roof, which is covered with lead, slate, or tiles, and sometimes decorated with a cresting in terra-cotta or metal-work. The term is also applied to the meeting of the common rafters on each side of a roof, which are sometimes butted against an upright board known as the ridge-piece. For the ridge-nyb see Ridge.

Riding, the art or practice of locomotion on the back of an animal or in a vehicle (the verb to ride originally meant “to travel,” or “go,” as the derived noun road means “a way”). Where no vehicle is specified (e.g. “riding a bicycle”), the word is associated with horseback riding, for exercise or pleasure.

The origin of the use of the horse as a means of transport goes back to prehistoric times. The fable of the centaurs, if the derivation from hercynia to goat, pynos, bull, he is accepted (but see Centaur), would indicate the early existence of pastoral peoples living on horseback, like the modern cowboys (cf. cow-punchers) or gauchos of North and South America. Archaeological discoveries in India, Persia, Assyria and Egypt show that in the polished stone age quarterary man had domesticated the horse, while a Chinese treatise, the Goei-leostate, the fifth book of the Vouking, a sort of military code dating from the reign of the emperor Huang-Ti (2637 b.c.), places the cavalry on the wings of the army. The Hebrews understood

1 For the linguistic arguments against Cynwulf’s authorship of the Riddles see especially A. Madert, Der Sprachat der allernigsten Rätsel des Exeterbuches und die Cynwulffrage (1900).
the use of the horse in war (Job xxxix. 18–25), as did the Persians (Cyrus at the battle of Thymbra), Greeks and Romans. The Greeks and Romans, especially the former, were skilled horsemen, and feats on horseback were a feature of their games. They used no stirrup, but had both bridle and bit. They rode bareback, or on a cloth or skin strapped to the horse.

When roads were poor and vehicles cumbersome horseback was almost the only method of travel for both sexes. With the introduction of steam-locomotion and the improvement of roads, however, riding has become to a large extent a sport, rather than a necessity. There are different styles of riding adapted to the different purposes for which horses are ridden—on the road, in the school, hunting, racing, steeple-chasing and in the cavalry service—just as there are different horses more suitable by conformation, breeding and training for each.

In western civilization there is a traditional difference between the riding of men and women, in this particular, that men ride astride and women on a side-saddle. But in the following observations we deal generally with the more important features of riding as practised astride.

After securing an animal of the right height, weight and disposition, with a saddle of a length and breadth of seat that fits the rider and that is lined to fit the back of the horse, with a bridle bitted to his mouth, the first step is to mount. Having taken up the reins, the rider should stand at his horse’s near (left) shoulder, facing towards the tail, and in that position hold the stirrup with his right hand for the reception of his left foot. By standing at the shoulder the rider is out of harm’s way in the event of the horse kicking while he mounts. Ladies generally have the aid of a block or a groom’s or escort’s hand beneath the left foot. But a woman should be able to mount without aid, by lowering her stirrup, so that she can reach it from the ground, and then raising it again when she is seated in the saddle. Riding astride is sometimes recommended for women. The chief argument in its favour—symmetrical development of the figure—is, however, lost if the growing girl becomes a side-saddle woman, for in the side-saddle position the pommels can be shifted to the off side on alternate days.

Having gained the saddle, the necessity arises for seat and hands. Here good instruction is imperative at the outset. The great desideratum in a seat on horseback is that it should be firm. A rider with an insecure seat is apt to be thrown by any unexpected movement the horse may make; and, without a firm seat, the acquisition of good hands is well-nigh hopeless, because, when the balance is once disturbed the insecure rider will have to depend on something else for the maintenance of his seat, and this generally takes the shape of “riding on the horse’s mouth,” a practice as cruel as it is ugly.

Having gained the saddle, the rider should adjust the stirrups to the proper length, depending on the kind of riding, the length of his leg and the roughness of the horse’s trot. Sitting well in the middle of the saddle, the thighs turned in, and the heels drawn somewhat back, the stirrup leathers may be let out or taken up to the position that the bottom of the stirrup is on a level with the inner ankle bone, and at this length, when the rider stands up, his fork will easily clear the pommel of the saddle. For maintaining his seat the horseman should depend upon his thighs and knees only, and not upon the knee and calf; a proper seat should be a mixture of balance and grip; a man riding by balance only is sure to be thrown, while to grip with all one’s might during an hour’s ride is to undertake as much exertion as should last for a whole day. The position of the foot exercises much influence on the security of the seat; it should be opposite the girth, parallel with the barrel of the horse, with the heels depressed. A good seat on a horse should not be strong merely; it should be graceful; above the loins the body should be loose, so as readily to adapt itself to every motion of the horse, but it should be upright.

Beginners are advised to practise riding with and without stirrups; thus, let the pupil who has ridden half an hour in a saddle without stirrups have a cloth substituted for the saddle for about ten minutes, care being taken to observe the rules already laid down for the position of the legs; in this way the proper seat will be strengthened.

The proper adjustment of the reins is the next thing to be attended to, and as the management of these depends so much upon the seat being firm and independent of the bridle the acquisition of a firm seat is certainly half-way towards the acquisition of good hands. An excellent way to start a pupil is on a sure-footed horse without bridle, the master governing him by a leading rein until the pupil has acquired a firm seat and can be trusted with reins. Assuming that a double-reined bridle is used, the third finger of the left hand should be first inserted between the snaffle reins; then the little, third and second fingers should be between the curb reins, the two outside reins being the curb, and the two inside ones the snaffle. In this manner of holding the reins the snaffle is not so likely to slip, while the curb can be easily slackened or drawn tighter. As military riders use the curb only the position of snaffle and curb as just explained is reversed in the cavalry service. The snaffle reins should be drawn up gently until the rider feels that he has an equal and light hold of his horse’s mouth on both sides, with just so much pressure that the slightest movement of the left or right rein would cause him to turn to the left or right respectively. The arms from the shoulder to the elbow should hang naturally, close to the sides, and the arms from elbow to wrist should be about parallel to the ground, the wrist being kept loose, so as to yield gently with every motion of the horse. The rider sitting in the position described, square to the front, with his shoulders well back, will be riding with fairly long reins, one of the secrets of good hands.

When the horse is in motion the hands should not be held rigid; as the horse’s mouth would thereby become dead, and the horse would lean unpleasantly on the hand; but the rider should give and take, without, however, entirely relaxing the hold.

In order to encourage the horse to walk the head must not be confined, but a light feeling of the horse’s mouth must be kept up. Should the horse, unasked, break into a trot, never snatch at his mouth, but restrain him gently. To trot, press the legs to the saddle, and raise the bridle hand a little, and, after a moment’s sitting close, begin to rise (“pose”) in cadence with the action of the horse. The rising to the trot should be performed easily; the legs must not swing backwards and forwards, nor should the hands be jerked up and down. To start the canter, which should always be done from the walk and not the trot, take up the curb rein a little and turn the horse’s head slightly to the right, at the same time pressing the left leg behind the girth; the horse will then lead with the off (right) fore leg, which is generally preferred; but a well-broken hack should lead with either leg at command, and if he be cantered in a circle to the left he must lead with the near leg, as otherwise an ugly fall is likely to result from the leg being crossed. Galloping is a pace not to be generally indulged in by park riders; when it is used, the hands should be kept low, the body thrown back, and an extra grip taken with the knees, as nearly all horses pull more or less when galloping.

Hitherto only road or park riding has been considered. When a person has become a fair road rider he has made some progress towards being a hunting man. But if first principles are disregarded, and a follower of hounds believes in the system “it doesn’t matter how you ride so long as you stick on,” he will not only always be a “sight” but a menace in the hunting field. Few self-taught riders attain to excellence; they may keep a good place in hunting, if possessed of plenty of courage, and mounted on a bold and not too tender-mouthed horse, but they never will be riders in the proper sense of the word.

Hunting and Riding to Hounds.—For practical purposes the chief difference between a park seat and a hunting seat consists in the shortening of the stirrups some two or three holes. The seat of the hunting man is the most important of any connected with amusement; he must sit firm, so as not to be thrown off when his horse leaps, or makes a mistake, and he must be able to save his horse under all circumstances, and to make as much of him as possible. As with road riding, so with hunting, the actual
length of the stirrups will depend a good deal upon the shape and action of the horse, but the nature of the animal and the peculiarities of the country ridden over will also have something to do with their adjustment. A puller will compel the rider to shorten his leathers one or perhaps two holes—a course that may also be rendered necessary in a hilly country, for, in going down hill, the stirrups, if kept at the ordinary length, will generally feel a great deal too long. The rider's body must always close to the saddle in leaping, for if he were jerked up, the weight of say only a stone on the stirrup-iron, which is supposed to be carried in the hind leg, on the other hand, if he has negotiated a large fence is sufficiently to throw the animal down. Nothing but actual practice with hounds can teach a man how to ride where all kinds of going and obstacles of various sorts, natural and artificial, can be met and overcome. For example, the country gone over is seldom level springy turf; it is up hill and down dale, across ride and furrow, over ground studded with ant-hills (which, unlike mole-hills, are often very hard), over piles of earth; in such a case the method of riding over, and nearly every horse will require different handling under similar circumstances. It will therefore be seen that much depends on the rider having good hands. This qualification, though generally understood, is difficult to define. A man with good hands never depends upon his reins for retaining his seat; nor does he pull at the horse's mouth so as to make him afraid to go up to his bit; nor again does he use more force than is necessary for the accomplishment of what he desires.

But besides all this, there is an unaccountable sympathetic something about the man with good hands that cannot be described. Riders appear to renounce pulling, refuseers take to jumping and clearing obstacles more nearly as handy as a trick horse in a circus. Though hands can be greatly improved by regular and judicious practice, yet in the highest form this is a gift and cannot be learned.

There are different kinds of "fences," as all obstacles are generally called. First, there is timber, such as gates, stiles and rails; this is the first and most common out of which any hunt will be made. Timber, or, to speak more properly, a fence, is either poached by cattle, or else is on the ascent or descent. Hedges vary according to the custom of the country in which they are found: they either grow in the solid field, and are protected by a ditch on one side, or are planted on a bank. There is a level with the field through which it flows, or there may be a space of some 6 or 7 ft. from the bank to the water. For the successful negotiation of brooks a bold horse is required, ridden by a bold man. Now, a timber of any size is the largest proportion of the field as water; even a clear 6 ft. of it will prove too much to some, while anything over 10 or 12 ft. will in general be crossed only by a very few. Some horses, good performers over any description of fence, will not jump water under any circumstances, while the converse is true of other horses; and, however bold the horse may be, he will soon refuse water if his rider be perpetually in two minds when approaching it.

The pace at which a hunter should be ridden at his fences depends upon the fences themselves, the number of them, and the ability of the hunter. With some very good jumpers—they can hardly be called good hunters—to steady them is to bid for a fall, while with some very clever hunters to hurry them is to bring them to grief. With ordinary horses a canter at a trot is a general rule to ride at all fences. A run at the pace can be managed. So, too, with places that have to be crawled over between trees, or with dykes to be crawled down. In jumping an ordinary hedge or ditch at moderate speed, there is of course a moment of time during which the horse is on his hind legs, and in theory the rider should then lean forward, but, in practice, this position is so momentary, and the bash out of the hind legs in the spring is so powerful, that it is best not to lean forward at all, because of the difficulty, if not impossibility, of, getting back in time for the return movement, when the rider should be prepared to render the horse some assistance with the bridle as his feet touch the ground.

When a line of willows indicates the whereabouts of a brook, the horse should be well collected, a clear place selected, so as circular water should be surrounded and the horse, if necessary, polished up short in strides, up to the very brink. If the horses jump at the brook, even though they fail to clear it, the rider may take it for granted that at that place the leap is within the capacity of any ordinary hunter in his stride; hence, in the order of events, the horse's feet come just right to take off, the mere momentum of his body would take him over a place 15 ft. wide.

The experience of a single day's hunting will teach the novice that horses are for large fences, or they are not. It is therefore necessary that a hunter should be handy at defending them if any accidents have arisen from horses rushing through a gateway directly the latch is released, or from their jumping a gate at which they have been pulled up to enable the rider to open it. The horse should be taught to obey the leg as well as the hand, and, by a slight pressure of the leg, should throw his haunches round to the left or right as occasion may require.

RIDINGS—(see also Horse-Racing).—The qualities possessed by a good jockey, either on the flat or across country, show value of early instruction in riding. After having been some time in a training stable, a lad is put on a quiet horse at exercise; his stirrups are adjusted, and the reins knotted for him at a proper length. Hesubsequently rides him over fences; he is taught to keep his seat, and, to keep his place in the string, a sluggish must be kept going, and an impetuous one restrained; they cannot both be ridden alike, but they must both be ridden as a jockey should ride them. In this way the lad learns the principle of defensive handling, gaining pace out of a lazy one, and leaving well alone with a nice firm but temperate mover; he learns to do everything in a horsemanlike manner, and when he has raised himself to the pitch of a "fashionable jockey, he will frequently see three parts speed, a horse's feet a day at race meetings. A jockey must therefore more than any other civilian rider, have a hand for all sorts of horses, and in the case of two and three year olds a very good hand it must be. Then, too, whatever his age, all his circumstances must be possessed by the steady-chase jockey, who should, above all things, be able to ride him to handle his horse while going at his fences at three-quarter speed. In most details the nearer a hunting man approaches to a "complete jockey" his horse, better; but in the matter of the seat it must be remembered that a jockey is not called upon to play the game, while none can tell when the hunting man may finish his day's work; the jockey can therefore ride with more absolute grip during his hunting than the rider to hounds.

divisions of Lindsey were known as the north, south and west ridings respectively.

RIDLEY, NICHOLAS (c. 1500-1555), English bishop and martyr, was descended from an old Northumberland family. The second son of Christopher Ridley of Unthank Hall, near Willemoteswick, in that county, he was born in the beginning of the 16th century. From a school at Newcastle-on-Tyne he was sent about 1518 to Pembroke Hall, Cambridge, being supported there by his uncle, Dr Robert Ridley (d. 1536), and specially distinguishing himself in Greek. Having graduated Master in 1531, he went to study at the Sorbonne in Paris and at Louvain, and on his return to Cambridge he was appointed junior treasurer of his college. In 1534 he was one of the university proctors, and he signed the decree of the university against the jurisdiction of the pope in England. About this time Ridley, who was now chaplain to the university, began to distinguish himself as an orator and a disputant, and to show leanings to the reformed faith. Having proceeded B.D. in 1537, he was appointed by Thomas Cranmer, archbishop of Canterbury, one of his chaplains, and in April 1538 the same prelate instituted him to the vicarage of Herne in Kent. In 1540 he was chosen master of Pembroke Hall; in 1541 he became chaplain to Henry VIII. and canon of Canterbury. In 1543 he was accused of heretical teaching and practices, but he managed to allay the suspicions of the royal commissioners, although just after his excision he finally abandoned the doctrine of transubstantiation.

In 1547 Ridley was presented by his college to the Cambridgeshire living of Soham, and in September of the same year he was nominated by Dr John Whitgift of Rochester for the bishopric. He was now on the throne and the new bishop was in high favour. He was one of the visitors who were appointed to establish protestantism in the university of Cambridge; in 1548 he helped to compile the English prayer book; and in 1549 he was one of the commissioners who examined Bishops Gardiner and Bonner. He concurred in their deprivation and succeeded Bonner in the see of London. Having signed the letters patent settling the English crown on Lady Jane Grey, Ridley, in a sermon preached at St. Paul's cross on the 9th of July 1553, affirmed that the princesses Mary and Elizabeth were illegitimate and that the succession of the former would be disastrous to the religious interests of England. When Lady Jane's cause was lost, however, he went to Framlingham to ask Queen Mary's pardon, but at once he was arrested and sent to the Tower of London. From his prison he wrote in defence of his religious opinions, and early in 1554 he, with Cranmer and Latimer, was sent to Oxford to be examined. He defended himself against a number of divines, but was declared a heretic, and this was followed by his excommunication. He refused to recant, and in October 1555 he was tried for heresy under the new penal laws, being degraded and sentenced to death. With Cranmer and Latimer he met his end at the stake in Oxford on the 10th of October 1555.

Ridley was a voluminous writer, but many of his writings have been lost. The Works of Nicholas Ridley D.D. were edited for the Parker Society by the Rev. Henry Christmas in 1841. His Life was written by his Oxford contemporary Thomas Baret in 1565, and there is a memoir of him in H. C. G. Moule's edition of the bishop's Discourses and Supper (1865). See also John Foxe's Acts and Monuments (new ed., 1877); J. Strype's Memorials of Cranmer (new ed., Oxford, 1840); G. Binski's History of the Reformation (new ed., Oxford, 1840); J. A. Freyer's History of England (1881 fol.); and J. Lingard's History of England (1854-55).

RIDOLFI, or RIDOLFO, ROBERTO DI (1531-1612), Italian conspirator, belonged to a famous family of Florence, where he was born on the 18th of November 1531. As a banker he had business connections with England, and about 1557 he settled in London, where he soon became a person of some importance, and consorted with William Cecil and other prominent men. During the early years of Elizabeth's reign he began to take a more active part in politics, associating with the discontented Roman Catholics in England and communicating with their friends abroad. In 1570 he set to work on the plot against the queen which is usually associated with his name. His intention was to marry Mary, queen of Scots, to the duke of Norfolk and to place her on the English throne. With the aid of John Lesley, bishop of Ross, he gained the consent of these high personages to the conspiracy, and then in 1571 he visited the duke of Alva at Brussels, Pius V. at Rome, and Philip II. at Madrid to explain to them his scheme and to gain their active assistance thereto. His messenger, by name Charles Baillie (1542-1625), was, however, seized at Dover, and in other ways the English government heard of the intended rising. Consequently, Norfolk and Lesley were arrested, the former being condemned to death in January 1572. Ridolfi, who was then in Paris, could do nothing when he heard this news, and his scheme collapsed. Afterwards he served the pope, but much of his later life was spent in Florence, where he became a senator and where he died on the 18th of February 1612.

RIEGE, PHILIPP FRIEDRICH VON (1818-1903), Bohemian politician and publicist, was born on the 18th of December 1818 at Semil in the circle of Jindl, Bohemia. He first came into prominence as one of the Czech leaders in the revolution of 1848. He was returned by seven constituencies to the Reichstag at Vienna, where he was the leader of the Czech party. In 1849 he married a daughter of the historian Palacky. In 1858 he started the Slovensky sbornik, the first national encyclopaedia, the first volume of which was published in 1859, the 11th and last in 1874. He was also instrumental in founding the first Czech political daily newspaper published in Prague, which appeared on the 1st of January 1861, and of which he was for a while the editor. After the issue of the “October diploma” of 1860, Rieger, with his father-in-law, Palacky, undertook the leadership of the reconstituted Czech party, and after the decision of this party in 1863 no longer to attend the Austrian Reichsrath, he led the agitation in favour of the restoration of the Bohemian kingdom. In 1871 he conducted the negotiations with the Hohenenwarth ministry for a federal constitution of the empire, which broke down owing to his extreme attitude in the matter of Bohemian independence. On the reappearance of the Czechs in the Bohemian diet (1878) and the Austrian Reichsrath (1879) Rieger was one of the leaders of the federalist majority supporting Count Taaffe's government. He became a member of the so-called “Old Czechs.” On his seventieth birthday (December 10, 1888) he received a national gift of 100,000 gulden; but, in spite of this evidence of his patriotism, his conservatism, his close connexion with the Bohemian nobility and his clerical tendencies brought him into conflict with the growing influence of the radical “Young Czech” party, and in 1891, together with the other “Old Czechs,” he was defeated at the poll. In March 1897 he was created a baron (Freiherr) and given a seat in the Upper House. He continued occasionally to interfere in politics; but his influence was now at an end, though when he died, on the 3rd of March 1903, his funeral at Prague was made the occasion of a magnificent demonstration of respect.

RIOÑUEZ, RAFAEL DEL (1784-1823), Spanish army officer, who has the melancholy distinction of having begun the long series of political military mutinies—pronunciamentos—in Spain, was born at Santa Maria de Tuna in Asturias on the 2nd of April 1874. He was educated for the legal profession in Oviedo, and passed the necessary examinations. But in 1808 he enlisted in the guard. When the French invasion took place in 1808 he was employed by the junta of Asturias and placed in command of a newly raised battalion. He was taken prisoner at the battle of Espinosa de los Menteros, on the 10th and 11th of November 1808, and was sent to France. During his years of imprisonment he, like many others of his countrymen, was converted to liberalism on the French model. Riego had the good fortune to escape and to reach England after various wanderings in Switzerland and Germany. In England
he was incorporated with other rescued or escaped Spaniards, in a corps equipped by the British government, and was sent to Spain in 1814. He continued in service as a military officer, and was commandant of the garrison and a division of the regiment "As a part which formed part of the army collected at Cadiz to be sent to South America in 1819. Service in America was unpopular with the soldiers, and there was much discontent in the country with the government of King Ferdinand VII. A conspiracy was formed among the officers to use the army for the purpose of forcing the king to grant a constitution. They were betrayed by a general who at first professed to sympathize with them, and many were arrested. Riego was apparently not suspected, and he decided to act on his own account. On New Year's Day 1820 he made his pronunciamiento with his regiment at the village of Cabezades de San Juan. He proclaimed for the constitution drawn up by the Cortes in 1812, which was unworkable, and which the chiefs of the conspiracy did not propose to restore. He hoped to seize Cadiz, but it was held by a loyal officer, and for a time no popular movement took place. Riego now started on a revolutionary propaganda through Andalusia at the head of his regiment. The couplet, "The statesman or hostler or at the best indifferent. His following gradually melted away, and he was about to flee to Portugal when Galicia revolted. The rebellion extended rapidly, and the king was compelled to yield. When the liberals were in possession of power they would gladly have kept Riego in a subordinate place. But he came to the capital, where he was soon the most popular spokesman of the extreme parties. There he discredited himself by his vanity, and shocked even the populace of Madrid by appearing drunk at the theatre. He was at last persuaded to accept the military command in Aragon, which he thought below his merits. He began intrigues and agitations. The government was strong enough to put him under arrest at Lérida. When the new Cortes was elected in 1822, he was chosen deputy for his native city Oviedo, and the radicals selected him as president of the chamber on the 17th of February 1823. The unceasing intrigues of the king, the inactivity of the moderate parties and the hysterical excitement of the mob combined to make anarchy worse daily. Riego was the noisiest shouter of all. When the French intervention took place, he helped to carry the king to Cadiz, and fought a few unsuccessful skirmishes with the invaders. He was last captured at a farmhouse near Arquillos in the province of Jaén. Unfortunately for him, he fell into the hands of the royalist volunters, by whom he was carried to the capital. On his way he was repeatedly mobbed and had many narrow escapes from being torn to pieces. He was hanged at Madrid in the Plaza de la Cebada on the 7th of November 1823. At the end he professed abject repentance for his impiety and disloyalty. The popular revolutionary tune of Spain, the "himno de Riego," is named after him, and his picture is hung in the Cortes, but he was a poor creature, and a bad example of the light-headed military agitators who have caused Spain much misery.

H. Baumgarten, Geschichte Spaniens (Berlin, 1865-1871).

RIEHM, EDUARD KARL AUGUST (1830-1888). German Protestant theologian, was born at Diersburg in Baden on the 20th of December 1830. He studied theology and philology at Heidelberg and later at Halle under Hermann Hupfeld, who persuaded him to include Arabic, Syriac and Egyptian. Entering the ministry in 1853, he was made vicar at Durlach soon afterwards, and became a licentiate in the theological faculty at Heidelberg. In 1854 he was appointed garrison-preacher at Mannheim; and in 1858 he was licensed to lecture at Heidelberg, where in 1861 he was made professor extraordinarius. In 1862 he obtained a similar post at Halle, and in 1866 was promoted to the rank of professor ordinarius. Throughout his life he followed Hupfeld's plan in his scientific treatment of the Old Testament—that of reconciling the results of a free criticism with a belief in divine revelations. His practical experience of pastoral work also proved of service to him when he became a professor of theology, for "if there is one quality more striking than another in the writings of Riemh, it is that of sympathy with orthodox believers" (T. K. Cheyne). In 1865 Riehm was made a member of the commission for the revision of Luther's translation of the Bible, and became one of the editors of the quarterly review, Theologische Studien und Kritiken. He died on the 5th of April 1888.

His works include: Die Gesetzgebung Mosis im Lande Moab (1854), in which the Deuteronomistic law book is assigned to the second hand of the reign of Manasseh; Die Laegende, die Hervor, 1858, ed. by F. Buehner, Lebens- und Charakter- bild eines deutschen Professors (1867); Die Messianische Weissagung (1875, 2nd ed. 1883; Eng. trans. 1901); Religion und Wissenschaft (1881); and the well-known Handwörterbuch des biblischen Altertums (1881-94). After his death were published the Einleitung in das Alte Testament (1889, ed. by A. Brandt), in which the date of the Deuteronomistic law book is placed earlier than in his book on the legislation of Moses—shortly before or at the beginning of the reign of Haschalia; and his Alttestamentliche Theologie (1889, ed. by Pahncke). See Herzog-Hauck, Realencyklopädie, and T. K. Cheyne, Founders of Old Testament Criticism.

RIEL, LOUIS (1844-1885). Canadian agitator, son of Louis Riel and Julie de Lagemanquière, was born at St Boniface, on the 23rd of October 1844, according to his own account, though others place his birth in 1847. Though known as a half-breed, he was of the old Acadian stock. His mother was of French blood and his father was a Red River Metis, his family was French. From 1866 he worked for two years at various occupations in Minnesota, returning in 1868 to St Vital, near St Boniface. In 1869 the transfer of the territorial rights of the Hudson's Bay Company to the dominion of Canada gave great uneasiness to the Métis, and in October 1869 a party led by Riel turned back at the American frontier the newly appointed Canadian governor; in November they captured Fort Garry (Winnipeg), the headquarters of the Company, and called a convention which passed a bill of rights. In December a provisional government was set up, of which the 29th of December Riel was made president, and which defeated two attacks made on it by the English-speaking settlers of the vicinity. So far the Métis had been within their rights, but Riel was frightful, vain and mystical, and his judicial murder on the 4th of March 1870 of Thomas Scott, an Orange-man from Ontario, roused against him the whole of English-speaking Canada. An expedition was equipped and sent out under Colonel Garnet, later Lord, Wolseley, which captured Fort Garry on the 24th of August 1870, Riel decamping. (See STRATTON, LOR.) He was not arrested, and on the 4th of August 1871 urged his countrymen to combine with the Canadians against a threatened attack from American Fenians, for which good service he was publicly thanked by the lieutenant-governor. In 1872 for religious reasons he changed his name to Louis David Riel. In October 1873 he became member of the Dominion parliament for Provencher, came to Ottawa and took the oath, but did not sit. On the 10th of April 1874 he was expelled the House, but in September was again elected for Provencher; on the 10th of February 1875 he was outlawed, and the seat thereby againvacated. In 1877-78 he was for over a year a patient in the Beaufort asylum for the insane, but from 1879 to 1884 he lived quietly in Montana, where in 1881 he married and settled. Later he moved to the village of St. Vital, where he had settled in 1881. From 1884 to 1885 he returned to Canada to win redress for their wrongs. His own rashness and the ineptitude of Canadian politicians and officials brought on a rising, which was crushed after some hard fighting, and on the 15th of May 1885 Riel surrendered. He was imprisoned at Regina, was tried and on the 1st of August found guilty of treason, and on the 10th of November was hanged at Regina, meeting his fate with courage. His death was the signal for a fierce outburst of racialism in Quebec and Ontario, which nearly overthrew the Conservative government of the Dominion.

RIEMANN, GEORG FRIEDRICH BERNHARD (1856-1866). German mathematician, was born on the 17th of September
RIEMANN

1826, at Breselenz, near Dannenberg in Hanover. His father, Friedrich Bernhard Riemann, came from Mecklenburg, had served in the war of freedom, and had finally settled as pastor in Quickborn. Here with his five brothers and sisters Riemann spent his boyhood and received, chiefly from his father, the elements of his education. He showed at an early age well-marked mathematical powers, and his progress was so rapid in arithmetic and geometry that he was soon beyond the guidance not only of his father but of schoolmaster Schulz, who assisted in the mathematical department of his training.

In 1840 he went to Hanover, where he attended the lyceum, and two years later he entered the Johanneum at Lüneburg. The director, Schmalfuss, encouraged him in his mathematical studies by lending him books (among them Leonhard Euler's works and Adrien Marie Legendre's *Theory of Numbers*), which Riemann read, mastered and returned within a few days. In 1846 Riemann entered himself as a student of philology and theology in the university of Göttingen. This choice of a university career was dictated more by the natural desire of his father to see his son enter his own profession, and by the poverty of his family, than by his own preference. He attended lectures on the numerical solution of equations and on definite integrals by M. A. Stern, on terrestrial magnetism by Goldschmidt, and to some extent to K. F. Gauss. It soon became evident that his mathematical studies, undertaken at first purely as a relaxation, were destined to be the chief business of his life. He proceeded in the beginning of 1847 to Berlin, attracted thither by that brilliant constellation of mathematical genius whose principal stars were P. G. L. Dirichlet, C. G. J. Jacobi, J. Steiner and F. G. M. Eisenstein. He appears to have attended Dirichlet's lectures on theory of numbers, theory of definite integrals, and partial differential equations, and Jacobi's on analytical mechanics and higher algebra. It was during this period that he first formed those ideas on the theory of functions of a complex variable which led to most of his great discoveries. One striking social incident at least marked this part of his life, for, during the revolutionary insurrection in March 1848, the young mathematician, as a member of a company of student volunteers, kept guard in the royal palace from 9 o'clock on the morning of the 24th of March till 1 o'clock on the afternoon of the following day.

In 1850 he returned to Göttingen and began to prepare his doctor's dissertation, busy ing himself meanwhile with "Naturphilosophie" and experimental work. The subject he had chosen for his Habilitationsschrift was the "Representation of a Function by Means of a Trigonometrical Series," a subject which Dirichlet had made his own by a now well-known series of researches. It was fortunate, no doubt, for Riemann that he had the kind advice and encouragement of Dirichlet himself, who was then on a visit at Göttingen during the preparation of his essay; but the result was a memoir of such originality and refinement as showed that the pupil was fully the equal of the master. Of the customary three themes which he suggested for his trial lecture, that "On the Hypotheses which form the Foundation of Geometry" was chosen at the instance of Gauss, who was curious to hear what so young a man had to say on this difficult subject, on which he himself had in private speculated so profoundly (see Geometry, Non-Euclidian).

In 1855 Gauss died and was succeeded by Dirichlet, who along with others made an effort to obtain Riemann's nomination as extraordinary professor. In this they were not successful; but a government stipend of 300 thalers was given him, and even this miserable pittance was of great importance, so straitened were his circumstances. But this small beginning of good fortune was embittered by the deaths of his father and his eldest sister, and by the breaking up of the home at Quickborn and his moving in with a warm-hearted Newmarch (Borchardt's *Journal*, vol. iv., 1857) in which he applied the theory developed in his doctor's dissertation to the Abelian functions. It is amusing to find him speaking jubilantly of the unexpectedly large audience of eight which assembled to hear his first lecture (in 1854) on partial differential equations and their application to physical problems.

Riemann's health had never been strong. Even in his boyhood he had shown symptoms of consumption, the disease that was working such havoc in his family; and now under the strain of work he broke down altogether, and had to retire to the Harz with his friends Ritter and R. Dedekind, where he gave himself up to excursions and "Naturphilosophie." After his return to Göttingen (November 1857) he was made extraordinary professor, and his salary raised to 300 thalers. As usual with him, misfortune followed close behind; for he lost in quick succession his brother Wilhelm and another sister. In 1859 he lost his friend Dirichlet; but his reputation was now so well established that he was at once appointed to succeed him. Well-merited honours began to reach him; and in August he visited Paris, and met with the great men. He married Elise Koch in June 1862, but the following month he had an attack of pleurisy which proved the beginning of a long illness that ended only with his death. His physician recommended a sojourn in Italy, for the benefit of his health, and Weber and Sartorius von Waltershausen obtained from the government leave of absence and means to defray the cost of the journey. At first it seemed that he would recover; but on his return in June 1863 he caught cold on the Splügen Pass, and in August of the same year had to go back to Italy. In November 1865 he returned again to Göttingen, but, although he was able to live through the winter, and even to work a few hours every day, it became clear to his friends, and clearest of all to himself, that he was dying. In order to husband his few remaining days he resolved in June 1866 to return once more to Italy. Thither he journeyed through the confusion of the first days of the Austro-Prussian War, and settled in a villa at Selasca near Intra on Lago Maggiore. Here his strength rapidly ebbed away, but his mental faculties remained brilliant to the last. On the 19th of July 1866 he was working at his unfinished investigation on the mechanism of the ear. The day following he died. Few as were the years of work allotted to him, and few as are the printed pages covered by the record of his researches, his name is, and will remain, a household word among mathematicians. Most of his memoirs are masterpieces—full of original methods, profound ideas and far-reaching imagination.

The collected works of Riemann were published by H. Weber, assisted by R. Dedekind (8vo, Leipzig, 1876; 2nd ed., 1892).
At the end of this volume there is a touching account of his life by the latter.  

RIENZI, COLA DI (c. 1313–1354), tribune of the Roman people, was born in Rome, being the son of a tavern-keeper named Lorenzo Gabrini. His father's Christian name was shortened to Rienzo, and his own, Nicholas, to Cola; hence the Cola di Rienzi, or Rienzo, by which he is generally known. His early years were passed at Anagni. Having devoted much time to the study of the Latin writers, historians, orators and poets, and filled his mind with stories of the glories and the power of ancient Rome, he turned his thoughts to the task of restoring his native city to its pristine greatness, his zeal for this work being quickened by the desire to avenge his brother, who had been killed by a noble, a member of the ruling class. He became a notary and a person of some importance in the city, and was sent in 1343 on a public errand to Pope Clement VI. at Avignon. He discharged his duties with ability and success, and although the boldness with which he denounced the aristocratic rulers of Rome drew down upon him the enmity of powerful men, he won the favour and esteem of the pope, who gave him an official position at his court. Returning to Rome about April 1344 he worked with the men at a greater object of his life, the restoration of the city to its former position of power. He gathered together a band of supporters, plans were drawn up, and at length all was ready for the rising. On the 19th of May 1347 heralds invited the people to a parliament on the Capitol, and on the 20th, the day being Whitsunday, the meeting took place. Dressed in full armour and attended by the papal vicar, Cola headed a procession to the Capitol; here he addressed the assembled crowd, speaking "with fascinating eloquence of the servitude and redemption of Rome." A new series of laws was published and accepted with acclaim, and unlimited authority was given to the author of the revolution. Without striking a blow the nobles left the city or went into hiding, and a few days later Rienzi took the title of tribune (Nicholas, severus et demens, liberatis, pactis justiciaeque tribunus, et sacre Romane Reipublce liberator).  

His authority quickly and quietly accepted by all classes, the new ruler governed the city with a stern justice which was in marked contrast to the recent reign of licence and disorder. In great state the tribune moved through the streets of Rome, being received with the applause of the crowd. While in a letter the poet Petrarch urged him to continue his great and noble work, and congratulated him on his past achievements, calling him the new Camillus, Brutus and Romulus. In July in a sonorous decree he proclaimed the sovereignty of the Roman people over the empire, but before this he had set to work upon his task of restoring the authority of Rome over the cities and provinces of Italy, of making the city again caput mundi. He wrote letters to the cities of Italy, asking them to send representatives to an assembly which would meet on the 1st of August, when the formation of a great federation under the headship of Rome would be considered. On the appointed day a number of representatives appeared, and after some elaborate and fantastic ceremonies Rienzi, as dictator, issued an edict citing the emperor Louis the Bavarian and his rival Charles, afterwards the emperor Charles IV., and also the imperial electors and all others concerned in the dispute, to appear before him in order that he might pronounce judgment in the case. On the following day the festival of the unity of Italy was celebrated, but neither this nor the previous meeting had any practical result. Rienzi's sovereignty was recognized in Naples, whence both Queen Joanna and her bitter foe, King Louis of Hungary, appealed to him for protection and aid, and on the 15th of August he was crowned tribune with great pomp, wreaths of flowers being placed on his head. Gregorovius says this ceremony "was the fantastic caricature in which ended the empire of Charles the Great. A world where political action was represented in such guise was ripe for overthrow, or could only be saved by a great mental reformation." He then seized, but soon released, Stephen Colonna and some other barons who had spoken disparagingly of him. But his power was already beginning to wane. His extravagant pretensions only served to excite ridicule. His government was costly, and to meet its many expenses he was obliged to lay heavy taxes upon the people. He offended the pope by his arrogance and pride, and both pope and emperor by his proposal to set up a new Roman empire, the sovereignty of which would rest directly upon the will of the people. In October Clement gave power to a legate to depose him and bring him to trial, and the end was obviously in sight. Taking heart, the exiled barons gathered together some troops, and war began in the neighbourhood of Rome. Rienzi obtained aid from Louis of Hungary and others, and on the 20th of November his forces defeated the nobles in a battle just outside the gates of Rome, a battle in which the tribune himself took no part, but in which his most distinguished foe, Stephen Colonna, was killed. But this victory did not save him. He passed his time in feasts and pageants, while in a bull the pope denounced him as a criminal, a pagan and a heretic, until, by a slight disturbance on the 15th of December, he abdicated and fled from Rome. He sought refuge in Naples, but soon he left that city and spent over two years in a small monastery.  

Emerging from his retirement, Rienzi journeyed to Prague, which he reached in July 1350, and threw himself upon the protection of the emperor Charles IV. Denouncing the temporal power of the pope he implored the emperor to deliver Italy, and especially Rome, from their oppressors; but, heedless of his invitations, Charles kept him in prison for more than a year in the fortress of Raudnitz, and then handed him over to Clement, who had been clamouring for his surrender. At Avignon, where he appeared in August 1352, Rienzi was tried by three cardinals, and was sentenced to death, but this judgment was not carried out, and he remained in prison in spite of appeals from Petrarch for his release. Freedom, however, was at hand. In December 1352 Clement died, and his successor, Innocent VI., anxious to strike a blow at the baronial rulers of Rome, and seeing in the former tribune an excellent tool for this purpose, pardoned and released his prisoner. Giving him the title of senator, he sent him to Italy with the legate, Cardinal Alborno, and having collected a few mercenary troops on the way, Rienzi entered Rome in August 1354. He was received with great rejoicing, and quickly regained his former position of power. But this latter term did not last long, for even shorter than his former one had been. Having vainly besieged the fortress of Palestrina, he returned to Rome, where he treacherously seized the soldier of fortune, Fra Monreale, who was put to death, and where, by other cruel and arbitrary deeds, he soon lost the favour of the people. Their passions were quickly aroused and a tumult broke out on the 8th of October. Rienzi attempted to address them, but the building in which he stood was fired, and while trying to escape in disguise he was murdered by the mob. Rienzi was the hero of one of the finest of Petrarch's odes, Spirito gentil, and also of some beautiful verses by Lord Byron. He was a man of vivid, but disordered, imagination, without possessing any conception of statesmanship. In 1887 a statue of the tribune was erected at the foot of the Capitoline Hill in Rome.  

Rienzi's life and fate have formed the subject of a famous novel by Bulwer Lytton, an opera by Wagner and of a tragedy by Julius Mosén. His letters, edited by A. Gabrielli, are published in vol. vii. of the Fonti per la storia d'Italia (Rome, 1896). See also Gregorovius, Cola di Rienzo und seine Zeit (Hamburg, 1841); Auriac, Etude historique sur N. Rienzi (Amiens, 1885); E. Rodocanachi, Cola di Rienzi (Paris, 1885); Kühn, Die Entwicklung der Bundes- und Staatsgewalt in Italien im 13. Jahrhundert (Berlin, 1905); A. von Rumohr, Geschichte der Stadt Rom (1867–70); and F. Gregorovius, Geschichte der Stadt Rom im Mittelalter, vol. vi. (Eng. trans., by A. Hamilton, 1898).  

RIESA, a town of Germany, in the kingdom of Saxony, pleasantly situated on the left bank of the Elbe, 30 m. N.W. of Dresden, on the main line of railway to Leipzig, and at the junction of lines to Chemnitz, Elterwerk and Nossen. Pop. (1905) 14,073. The river is here crossed by a fine bridge, a
RIESENGEbirge

sandstone and iron structure, carrying both railway and road, and replacing the one carried away by floods in 1875. The town contains two Evangelical churches, a castle, formerly a convent and now used as a town hall, and several schools. There is a harbour with quays and a dockyard, also rolling-mills and saw-mills, ironworks and sandstone quarries. Other industries are the manufacture of furniture, beer, soap, carriages and bricks. The most important shipping station on the Elbe in Saxony, Riesa is the landing-place for goods to and from Bavaria, and a mart for herrings, petroleum, wood, coal and grain. A constant passenger steamboat communication is maintained with Meissen and Dresden; and, owing to the artillery practice ranges at Zeithain, on the right bank of the Elbe, Riesa has become of recent years one of the chief depots of the Saxon army. Riesa received municipal rights in 1632; and after a period of decay was again raised to the rank of a town in 1859.

RIESENER, JEAN HENRI (1734-1806), French cabinet-maker of the Louis XVI period, was born at Gladbach near Cologne. At an early age he went to Paris, where he entered the workshop in the Arsenal of Jean François Oeben (q.v.). When that great master died, in 1770, he was left with him, and later married Mme. Oeben, and in 1768 was admitted "maître menuisier-ébéniste." His wife died in 1776, and in 1782 he espoused, as his second wife, Anne Grezel, daughter of a bourgeois of Paris. The union was unhappy, and when, under the first Republic, divorce was legalized, the marriage was dissolved. When Riesener contracted his first marriage he possessed little or nothing; his second contract of marriage recited that in cash and in the money due to him by Louis XVI he was worth more than £20,000, without counting the finished work in hand, bronze models, jewels and personal effects and invested funds. Thus in fifteen years he had accumulated a fortune amounting in all to about £40,000. By that time there had been conferred upon him the title, formerly enjoyed by Oeben, of "Ébéniste du Roi." He died on the 6th of January 1806, in the Enclos des Jacobins, leaving an only son, Henri François (1797-1828), a distinguished portrait-painter of the First Empire. Riesener was unquestionably the greatest of the Louis Seize cabinet-makers. His name is stamped upon the Bureau du Roi in the Louvre, and, although the original conception of the work was with Oeben, to Oeben, it cannot be doubted that its consummate finish and perfect achievement must in great measure be attributed to the man who completed it. Occasionally there may, perhaps, be some lack of spontaneity in his forms, but his work is generally at once bold and graceful. His marquetry presents an extraordinary finish; his chiselled bronzes are of the first excellence. He was especially distinguished for his cabinets, in which he employed many European as well as exotic woods. Wreaths and bunches of flowers form the centres of the panels; on the sides are often diaper patterns in quiet colours. Yet despite his distinction as a maker of cabinets his high-water mark was reached in the Bureau du Roi, finished in 1769 and consequently belonging rather to the Louis Quinze than the Louis Seize period, and a not altogether dissimilar cylinder bureau believed to have been made for Stanislas Leszczynski, king of Poland, now in the Wallace Collection. Stanislas died in 1766, but the desk was not completed until February 20, 1769, apparently by the inspection accompanying the maker's signature. Upon its completion it passed into the possession of the French crown and was included in a sale of the royal furniture which took place in Holland. It was purchased by Sir William Hamilton, then British Minister at the Hague, and appears to have passed out of his hands when he left Naples, where it was purchased by Sir Richard Wallace. At Buckingham Palace there is a third bureau on the same lines. These pieces are triumphs of marquetry. They are inlaid with trophies of musical instruments, doves, bouquets and garlands of flowers; the bronze vases and "galleries" are exquisite—they may possibly be the work of Gouthière, but are more probably from the hands of Duplessis. For several years this great artist appears to have used the models of his master Oeben, but there was a gradual transition to a style more individual, more delicately conceived, with finer but hardly less vigorous lines. By the time he had been working alone for ten years he had completely embraced the Louis Seize manner—he had, perhaps, some responsibility for it. One of the most distinguished of his achievements for the court was the famous flat writing-table now at the Petit Trianon, for which he received only £200. The extent of these royal orders may be gauged from the fact that between 1775 and 1785 Riesener received 500,000 livres from the Garde Meubles, notwithstanding that during the whole of this period Gondouin the architect was the official designer for furniture for the royal palaces. Like so many other artists he was condemned in the end to sacrifice to the false taste of his day, and a certain number of his creations, otherwise delightful, were vitiated by being mounted with panels of Sèvres, Wedgwood and other china. The beautiful little secretaire in the Jones collection in the Victoria and Albert Museum suffers seriously by this lapse.

RIESENgebirge (Bohemian Krkonose), or Giant Mountains, a lofty and rugged group on the boundary of Silisia and Bohemia, between the upper courses of the Elbe and the Oder. They form the highest portion of the Sudetic system which stretches along the upper course of the Elbe from the Austrian empire, and finds its natural continuation towards the N.W. in the Erzgebirge, the Thuringian Forest and the Harz Mountains. Adjoining the Isargebirge and the Lausitzergebirge on the W., and the Eulengebirge and the Adlergebirge on the E. and S.E., the Riesengebirge proper run S.E. and N.W. between the sources of the Zäken and the Bober, for a distance of 23 m., with a breadth of 14 m. They cover an area of about 425 sq. m., three-fourths of which is in Austrian, and the remainder in Prussian territory. The boundary line follows the crest of the principal chain or ridge (Riesenkamm), which stretches along the northern side of the group, with an average height of over 4000 ft. The principal peaks are the Reifträger (4430 ft.), the Hohe Rad (4068 ft.), the Great Stormhaube (4862 ft.), the Little Stormhaube (4864 ft.), and, near the east extremity, the Schnee koppe or Riesken koppe (3566 ft.), the loftiest mountain in northern or central Germany. Roughly parallel to this northern ridge, and separated from it by a long narrow valley known as the Siehengründe, there extends on the S. a second and lower chain, of bronze mountains, "saw-knees," with comparatively few peaks. The chief heights here are Kesselkoppe (4708 ft.), the Krkonose (4819 ft.), the Ziegenrücken and the Brunnenberg (5072 ft.). From both ridges spurs of greater or less length are sent off at various angles, whence a magnificent view is obtained from Breslau to Prague; the lowlands of Sillesia, watered by the Oder, and those of Bohemia, intersected by the Elbe and the Moldau, appearing to lie mapped in relief. The summit is crowned by a chapel dedicated to St Lawrence, which once also served as a traveller's shelter. Since 1868 the chapel has been restored to its religious use, and a hotel for the accommodation of tourists is built close by. A remarkable group of isolated columnar rocks are those known as the Adersbacher Felsen in a valley on the Bohemian side of the Riesengebirge, 6 m. W.N.W. of Brannau.

On its northern side this mountain group rises ruggedly and precipitously from the Hirschberg valley; but on its southern slope the Silseian chain is very much more gradual. The scenery is in general bold and wild. The Bohemian ridge is cleft about the middle by a deep gorge through which pour the headwaters of the river Elbe, which finds its source in the Siehengründe. The Isar, Bober, Aupa, Zacken, Queiss, and a great number of smaller streams also rise among these mountains on their skirts; and small lakes and tarns are not infrequent in the valleys. The Great and Little Schneegruben—two deep rocky gorge-like valleys in which snow remains all the year round—lie to the north of the Hohe Rad.

Nearly the whole of the Riesenkamm and the western portion of the southern chain are granite; the eastern extremity of the main ridge and several mountains to the south-east are formed of a species of gneiss; and the greater part of the Bohemian chain, especially its summits, consists of mica-slate. Blocks of these minerals lie scattered on the sides and ridges of the mountains and
RIETI—RIFLE

RIETI (anc. Reate), a city and episcopal see of Italy, in the province of Perugia, 25.5 km by rail and 15.5 km direct S.S.E. of Terni, which is 70 km by rail from Rome. Poq. (1901) 14,145 (town), 17,716 (commune). It occupies a fine position 1318 ft. above sea-level on the right bank of the Velino (a torrent sub-articiped to the Tibre), which at this point issues from the limestone plateau; the old town occupies the declivity and the new town spreads out on the level. While with its quaint red-roofed houses, its old town walls (restored about 1250), its castle, its cathedral (13th and 15th centuries), its episcopal palace, its several churches and convents Rieti has no small amount of medieval picturesque ness; it also displays a good deal of modern activity in vine and olive growing and cattle-breeding. The fertility of the neighbourhood is celebrated both by Virgil and by Cicero. A Roman bridge over the Tiber, and the Palazzo Vincentini by Vignola deserve to be mentioned.

Reate was reached from Rome by the Via Salaria (g.v.), which may originally have ended there, and a branch road ran from it to Interamna. While hardly mentioned in connexion with the Punic or Civil Wars, Reate is described by Strabo as exhausted by these wars; the inhabitants of the town fled to the mountains and at the same time with the rest of the Sabines (290 b.c.), but it appears as a praefectura and not as a municipium down to the beginning of the empire. It was never made a colonia, though veterans of the Roman army in the mountain districts of Umbria and of the Sabine district were settled there by Vespasian, who belonged to a Reatine family and was born in the neighbourhood. For the contests of the Reatines with the people of Interamna see TERNI. In 1149 the town was besieged and captured by Roger I. of Sicily. In the struggle between church and empire it always held with the former; and it defied the forces of Frederick II. and Otho IV. Pope Nicholas IV. long resided in Rieti, and it was there he crowned Charles II. of Anjou King of the Two Sicilies. In the 14th century Robert, and afterwards Joanna, of Naples managed to keep possession of Rieti for many years, but it returned to the States of the Church under Gregory IX. About the year 1500, the liberties of the town, long dependent on the monarchs of the House of Anjou, were confirmed to it, but were afterwards abolished. An earthquake in 1785 was in 1790 followed by the much more disastrous pillage of Rieti by the papal troops for a space of fourteen days.

RIETSCHEL, ERNST FRIEDRICH AUGUST (1804-1861), German sculptor, was born at Pulsnitz in Saxony. At an early age he became an art student at Dresden, and subsequently a pupil of Rauch in Berlin. He there gained an art studentship, and studied in Rome in 1827-28. After returning to Saxony he soon brought himself into notice by a colossal statue of Frederick II. of Prussia, which was accepted by the academy of Dresden, and henceforth became one of the chief sculptors of his country. In 1832 he was elected to the Dresden professorship of sculpture, and had many foreign orders of merit conferred on him by the governments of different countries. He died at Dresden in 1862.

Rietschel's style was very varied; he produced works imbued with much religious feeling, and to some extent he occupied the same place as a sculptor that Overbeck did in painting. Other important works by him were purely classical in style. He was especially famed for his portrait figures of eminent men, treated with much idealism and dramatic vigour; among the latter class his chief works are colossal statues of Goethe and Schiller for the town of Weimar, of Weber for Dresden and of Lessing for Brunswick. He also worked a great deal for the imperial government, and he produced many graceful pieces, particularly a fine series of bas-reliefs representing Night and Morning, Noon and Twilight, designed with much poetical feeling and imagination.

For a good biography of Rietschel and account of his works see Appenmann, Ernst Rietschel (Leipzig, 1865). (J. H. M.)

RIEU, CHARLES PIERRE HENRI (1850-1902), Swiss Orientalist, was born at Geneva in 1850. He studied at Bonn University, where he received his doctor's degree in 1843. He entered the British Museum in 1847, and after twenty years of service, a new post, that of keeper of Oriental manuscripts, was created for him. He completed in 1871 the second part, dealing with Arabian MSS., of the Catalogus codicum manuscriptorum orientalium, which had been begun by William Cureton, and he issued a supplementary volume in 1894. He also drew up a Catalogue of the Turkish Manuscripts (1888) and a Catalogue of the Persian Manuscripts (4 vols., 1879-95), the latter being a storehouse of information on the books and their authors. In 1895 he was made professor of Arabic in the university of Cambridge in succession to Robertson Smith. He died in London on the 19th of March 1902.

RIEVAUX, a village in the North Riding of Yorkshire, England, 3 m. W. by N. of the small town of Helmsley, which is served by a branch of the North-Eastern railway. Here, exquisitely situated in a deep wooded valley, are the ruins of Rievaulx Abbey, a foundation by Walter l'Espec in 1135 for a society of Cistercian monks, the first to be founded in the north of England. The principal remains are those of the cruciform church, mainly Early English in character, and the monastic buildings. There are considerable fragments of the refectory, and all the important domestic buildings may be traced. A beautiful prospect over the ruins and the valley is seen from the terrace on the eastern flanking hill.

RIFFIANS, the name given to the Berbers of the Rif district of Morocco, the mountain region bordering the north coast from Ceuta eastward nearly to the borders of Algeria and forming part of the Atlas range. The name, it has been suggested, is identical with Libyan or Libi. A peculiarity of the Rif dialect is the change of the Arabic "I" to "r," and this would seem to support this derivation, "b" and "f" being interchangeable through "v." The Rifians are only nominally subject to the sultan of Morocco, against whose authority they are in constant revolt. They are typical Berberbs in physique, tall, well made and sturdy, with European features and fair skins bronzed by the sun. In morality they are singularly superior to their neighbours. In order to prevent the spread of infidels, marriages are contracted between children of eight years old, the girl being brought home to live with the lad at his parents' home till a child is born, when a separate dwelling is provided for the youthful couple. The women are noted for their beauty. The Rifians understand and speak Arabic very little. They were among the fiercest and most cruel of the pirates of the north coast of Africa. Even now they are entirely untrustworthy in this respect. See further BERBERS, MOROCCO, MOORS, KABYLES, MAZARITES.

RIFLE, a firearm which may be shortly defined as a musket in which, by grooves (cf. Ger. rifflen, to groove) in the bore or otherwise, the projectile is forced to rotate before leaving the barrel. This rotatory motion, maintained during flight, tends to produce a bias of the projectile. Designs which introduce irregularities in the form or weight of the bullet, and so lessen the tendency to depart from a straight line, and also in a measure overcome the chief shortcoming of the smoothbore musket. Rifling was invented about 1520, by Gaspard Koller or Kolliner, a gunmaker of Vienna, according to some authorities; by August Kotter of Nuremberg, according to others. It has been said
that at first the grooves were made straight, with the object of admitting a tight-fitting bullet and relieving the effects of fouling, and that the virtue of spiral grooving was subsequently discovered by accident. But this theory is unsupported. The earliest known rifle barrels have spiral grooving. The amount of turn varied in old rifles from a half or three-quarters turn to one turn in two to three feet. The form and depth of the grooving and the number of grooves also greatly varied.

Historical Development of Military Rifles.—For the chief infantry firearms that preceded the modern military rifle, see GUN, ARMS AND ARMOUR (firearms), ARQUEBUS, &c. Rifles were at first used for amusement. There are, however, instances of their occasional employment in war in the 17th and 18th centuries. In 1631 the landgrave of Hesse had a troop of riflemen. Ten years later Maximilian of Bavaria had several troops armed with rifled arquebuses. Louis XIII. armed his bodyguard with rifles. Napoleon withdrew the rifle from those of his troops to whom it had been issued during the wars of the Republic, nor did the French make any considerable use of it again until 1830, when the Chasseurs d’Orléans were armed with it for the invasion of Algeria. The British learnt the value of rifles during the American War of Independence, when the government subsidized continental jägers armed with rifles to oppose the American riflemen. After the war these corps disappeared, and though they are now represented by the 60th (King's Royal) Rifles, the senior rifle corps in the British Army is the Rifle Brigade, raised in 1800 as the 95th Regiment and armed with a flint-lock weapon known as “Baker's Rifle,” which weighed 9½ lb. The barrel was 2½ ft. long, its calibre 20-bore, with seven grooves making a quarter-turn in its length. A small wooden mallet was at first supplied with this rifle to make the ball enter the barrel, and it was loaded with great difficulty. In 1826 Delvigne, a French infantry officer, invented a breech with abrupt shoulders on which the spherical bullet was rammed down until it expanded and filled the grooves. The objection was that the deformed bullet had an erratic flight. Delvigne’s system was subsequently improved upon by Thouvenin, who introduced into the breech an iron stem, upon which the bullet, now of conical form, rested, and was expanded by a sharp blow with the iron ramrod when loading. In William IV.’s reign the Brunswick percussion rifle was introduced into the British rifle regiments. Its weight with bayonet was 11 lb 5½ oz.; length of barrel, 2 ft. 6 in., with two grooves making one turn in the length of the barrel; weight of spherical belted bullet, 557 grs.; diameter, .704 in.; charge of powder, 23 drs. This rifle was not easily loaded, soon fouled, and shot wild beyond 400 yds.

In 1835 W. Greener produced a new expulsive bullet, an oval ball, a diameter and a half in length, with a flat end, perforated, in which a cast metallic taper plug was inserted. The explosion of the charge drove the plug home, expanded the bullet, filled the grooves and prevented windage. A trial of the Greener bullet in August 1835 proved successful. The range and accuracy of range were improved while the loading was made as easy as with a smooth-bore musket. The invention was, however, rejected by the military authorities on the ground that the bullet was a compound one. In 1852 the Government awarded Minie, a Frenchman, £20,000 for a bullet of the same principle adopted into the British service. In 1857 Greener received a belated reward of £1000 for “the first public suggestion of the principle of expansion.” The Minie bullet contained an iron cup in a cavity at the base of the bullet. In 1851 a rifled musket of the Minie pattern was introduced into the British army, and, though not generally issued, was used in the Kaffir War of 1851, and in the Crimean. Its weight with bayonet was 10 lb 8½ oz., length of barrel 3 ft. 3 in., with four grooves making one turn in 72 in.; diameter of bore .702 inch; charge of powder 23 drs., and sighted from 100 to 1000 yds. The form of its bullet was at first conoidal, afterwards changed to cylindrical-conoidal, with a hemispherical iron cup. In 1855 the Enfield rifle, having in a series of trials competed favourably with the Minie and Lancaster rifles, was introduced into the British army; it was used during the latter part of the Crimean war, when there replaced the Minie rifle and the percussion musket, and remained the general weapon of the entire infantry until the introduction of the breech-loader in the year 1867. This rifle weighed, with bayonet, 9 lb 3 oz., barrel 39 in.; diameter of bore .577 in.; three-grooved, with one turn in 78 in. It fired a bullet of cylindrical-conoidal form with hollow base, weighing 350 grains, made up into cartridges and lubricated as for the Minie rifle, adapted to this rifle by Pritchett, who was awarded £1000 by the Government. This bullet was wrapped in greased paper round the cylindrical part half-way up its length. Short rifles of the same pattern, with five-grooved barrels 2 ft. 9 in. long and a sword bayonet, were supplied to the 60th Rifles and to the Rifle Brigade. Two small carbines of the same principle were at this time introduced for the cavalry and artillery, also a rifled pistol.

In 1854, on the suggestion of General Lord Hardinge, Sir Joseph Whitworth, the first mechanician of the day, began to consider the subject of rifling, and after a long series of experiments the Whitworth rifle was produced with hexagonal bore, .45-in. calibre, and with one turn in 20 in. It was tried at Hythe in 1857, and completely defeated the Enfield rifle up to 1800 yds. upon a fixed rest. This trial and Whitworth’s experiments proved the advantages of a sharp twist, a smaller bore, and elongated projectile; but Whitworth’s rifle was never adopted into the Government service, probably because the hexagonal rifling wore badly, and owing to the difficulty of equal mechanical perfection in all similar rifles and ammunition. Several improvements were subsequently made in the sighting, grooving and some other details of the Enfield rifle. In 1855 a boxwood plug to the bullet was used.

Between 1857 and 1861 four breech-loading carbines were experimentally introduced in the cavalry—viz. Sharp’s, Terry’s, Green’s, and Westley-Richards’. Sharp’s and other breech-loading carbines and also Spencer repeating carbines were used by the Federal cavalry in the American Civil War. The general adoption of the breech-loading principle may be said to date from 1867. The Prussians were the first to see its great advantages, and about 1841 had adopted the celebrated needle-gun (q.v.), a bolt-action weapon. In 1864 and 1866 committees were appointed by the British War Office to report on breech-loading arms, and after protracted experiments, Jacob Snider’s method of conversion of the muzzle-loading Enfield to a breech-loader (fig. 1) was adopted, with the metallic cartridge case improved in 1867 by Colonel Boxer, R.A. All available Enfield rifles were thus converted, and new arms made with steel barrels instead of iron. Great Britain was the first to adopt for her army a breech-loading...
rifle with metallic cartridge-case, which secured the perfect obturation of the breech. The Snider breech was a hinged block, a type much in favour at the time. The French similarly converted their muzzle-loaders, the converted weapon being known as the Tabatière or snuff-box. Other breech actions on the same principle were the Austrian Wenden and the Bavarian Podewils and Werder rifles. But these were only transitional arms. In 1866 France adopted the bolt-action Chassepot (q.v.); in 1867 Sweden the Hagström, and Russia the Carte; in 1868 Italy the Carcano. All these were breech-loaders firing paper cartridges containing their own means of ignition. After further experiments by a fresh committee the Martini-Henry rifle (fig. 2) was definitely adopted by the British army in 1871, with the short chamber Boxer-Henry ammunition. This rifle was a combination of Martini's block-action breech mechanism with Henry's barrel of .45-in. calibre, firing a papered bullet of 480 grains from Boxer cases with a wad of wax lubrication at base of bullet, as proposed by Henry. The Henry rifling had seven grooves with one turn in 22 in.; the lands and the centres of the grooves were contained in the same circle. About the same time or a little later the various powers re-armed their infantry with breech-loaders of different patterns and names, all of which were of about 11 mm. (.433 in.) calibre, and nearly all of the bolt-action type.

The next stage in the history of military firearms was the introduction of the repeating or magazine system. The Winchester rifle, an American invention which appeared in 1865, was one of the earliest magazine rifles. This weapon was used by Turkey to some extent in the Russo-Turkish War of 1877-78, but Germany was the first great power to provide its army with a magazine rifle. In 1884 it converted the 1871 pattern Mauser of .453 in. bore into a magazine rifle, holding eight cartridges in a tube magazine in the fore end. In 1885 France followed with the Lebel, which had an enormous advantage in its smokeless powder. In 1886 the question of the best calibre for small arms was reopened in England. In this year, 1886, Austria had adopted a Mannlicher rifle, .433 bore, with a straight-pull bolt. This rifle was the first adopted by any European nation embodying Lee's box magazine, an invention patented in 1879 and 1882, and consisting of a box, in rear of and below the entrance to the chamber, containing the cartridges. Another important improvement, the steel clip loader containing five cartridges, was also introduced with this rifle. In 1888 these rifles were converted to .315 bore, firing black powder cartridges; and in 1890, on the introduction of smokeless powder, the sights were re-graduated. In 1887 the British Small Arms Committee, after experiments with the small-calibre rifle invented in 1883 by the Swiss Major Rubin, director of the Federal laboratory at Thun, recommended the small calibre for adoption into the British service. The essential features of Rubin's system were the employment of a compound bullet with a leaden core in a copper envelope, and the use of a compressed charge of black powder. In 1888 a pattern of .303-in. calibre rifle, fired on the Metford system and with the improved Lee bolt and magazine, was approved for trial by British troops. The Metford rifling is as follows—diameter of bore, .303 in.; depth of rifling, .004 in.; width of lands, .023 in.; twist of rifling, one turn in 10 in. (left-hand); radial grooves, seven in number. About 1892, and later, W. E. Metford had carried out an exhaustive series of experiments on bullets and rifling. He invented the important system of light rifling, with increasing spiral with a hulked bullet. The Metford match rifle was prominent in all N.R.A. competitions from 1877 to 1894. In 1887 he laid down for the Small Arms Committee the proper proportions for the grooving, spiral and cartridge chamber of the .303 military rifle. This weapon proved satisfactory and was adopted by the War Office as the Lee-Metford rifle, Mark I., in December 1888. It had a magazine of eight cartridges. In 1891 the Mark II. pattern was approved, with a ten-cartridge magazine, a simplified bolt, and many minor improvements. A magazine carbine with barrel 21 in. long and a six-cartridge magazine, otherwise identical with the Lee-Metford Mark II., was also approved. The Lee-Metford Mark II. rifle was subsequently further improved in its rifling to resist the wear of smokeless powder, and also in its bolt action, and became known as the Lee-Enfield rifle and under that name was officially adopted as the rifle of the British army. The number of grooves were reduced from seven to five. Neither the Lee-Metford nor the Lee-Enfield has increasing spiral grooves, which are found inconvenient for military arms from a manufacturing point of view.¹ The L.M. and L.E. carbines are similar to the shorter models of the rifles, but are covered for the whole length of the barrel by a wooden handguard and take only six cartridges; the fore-sights are protected by wings on the nose-cap, and the long-range sights are omitted. These, as also the Martini-Metford and Martini-Enfield carbines (falling-block action small-bore), have practically been replaced by the "short" rifle described below.

The efficiency of the modern small-bore magazine rifle is largely due to the production of smokeless nitro-compound powder. France was the first country to adopt, about 1885, a smokeless powder with the Lebel magazine rifle. It was known as "Vieille" powder, or "Poudre B" (after General Boulanger). Since then smokeless explosives have been universally adopted in all small-bore magazine military rifles. The smokeless explosive known as "Cordite" or "Cordite M.D." (see Cordite) is used for the cartridges of the Lee-Metford and Lee-Enfield rifles and rifle-calibre machine guns.

¹Of all modern military rifles, the Italian 1891 weapon alone has an increasing twist.

**RIFLE**
single-loader, and to reserve the magazine (which held ten cartridges, or twice as many as the multiple-loading Mausers, Mannlachers, &c.) for emergencies. But from about 1903 this equivalence of infantry weapons began to be disturbed by two new influences: the tendency towards a "short" rifle, and the introduction of the pointed bullet.

In the first, Switzerland took the lead with the short Schmidt-Rubin in 1900. But amongst the greater powers, England and the United States alone have followed her example. At the close of the South African War Great Britain issued 1000 short Lee-Enfield rifles experimentally, and in 1903 the "short rifle" was actually approved and issued generally. Since then it has been improved in details. The barrel was shortened by 5 in., multiple-loading by charger was introduced, and by the Musketry Regulations of 1909 magazine fire was laid down as the normal, single-loading being forbidden. The change met with very considerable opposition, especially from target-shooting experts, who maintained that a long rifle, so perfected in details as to be equal to the short in every point except in length, must be more accurate. The view of the military authorities, which was maintained in spite of criticism, was that for service purposes, and especially for prolonged snap-shooting, the handler weapon was preferable. One important factor in the decision was the desire to give the cavalry a weapon with which, when dismounted, it could fight the infantry rifle on equal terms. A more serious objection than that of want of superfluous accuracy in bull's-eye shooting was the loss of 5 in. of reach in bayonet fighting. This objection was met in 1907 by the introduction of a new pattern bayonet with a blade 5 in. longer. In 1908 the long Lee-Enfield and Lee-Metford rifles in store were converted for charger-loading (fig. 3), fitted with safety catches and new sights, and issued to the infantry of the Territorial Force in 1909 and 1910. For target purposes many rifle shots prefer this converted weapon to the short rifle (fig. 4).

**FIG. 3.—Charger-loading L.E. (Text Book of Small Arms, by permission.)**

The United States in 1904 replaced the Krag-Jürgensen (handloading horizontal magazine) by the short Springfield. A sort of spring bayonet was at first fitted to this rifle, but it was soon replaced by an ordinary sword bayonet.

The pointed bullet ("Spitz-geschoss" or "S") was introduced by Germany in 1905, and her example was quickly followed by France (balle D) and other powers. Its advantage is a considerable flattening of the trajectory, chiefly on account of the lessened resistance of the air. This latter allows of a reduction in the sectional density and consequently in the weight of the bullet. Thus velocities up to 2900 feet-seconds are realized, which enables the "dangerous space" to be very greatly augmented (see fig. 20). The "fixed sight" range with the "S" bullet is 700 yds., as against the Lee-Enfield's 500. It was announced in the House of Commons in 1910 that a modified bullet was being experimented with, and that some increase in the fixed-sight range was expected to be obtained, but the relatively weak breech action of the Lee-Enfield—which is due chiefly to the rearward position of the locking lugs—does not allow designers such freedom in the matter of increasing velocities, as the chamber pressure has to be kept low. It will be seen from the table that other rifles are constructed to stand a much higher pressure.

But both these improvements are destined to be eclipsed by the adoption of the automatic rifle. The application of the automatic principle to the modern high-velocity small-arm of precision has been occupying the attention of the small-arms experts of all armies and of numerous private inventors for some years past. These numerous attempts have, in the case of the rifle, been largely doomed to failure because of the necessary limitations of space and weight; although the automatic principle has been successfully applied both to machine guns (q.v.) and to pistols (q.v.). In these weapons the work of extracting the empty cartridge-case, re-loading and re-cocking, is accomplished either by the motive power of the recoil or of the gas generated by the explosion of the powder, thus enabling a rapid and continuous fire to be maintained to the full capacity of the weapon's magazine. In the case of machine guns the firing also is automatic, but self-firing rifles are not very desirable as infantry weapons and in addition are so heavy as to approximate to machine guns.

Of the recoil-operated class of automatic rifles there are two subdivisions, "short-recoil" and "long-recoil." In the former, which is most favoured by inventors, the barrel, body and bolt recoil together for a short distance, about \( \frac{1}{2} \) in., in which space the bolt is unlocked, and the bolt then recoils freely in the body. The bolt is run forward in reloading by a spring. In the long-recoil type the barrel, body and bolt are all inhibited (fig. 10) in the body, and the barrel and bolt are run up by one spring, the bolt by another. Several such rifles have been shown at the N.R.A. meetings at Bisley; the Rexer, Mauser and Woodgate rifles being on the long-recoil, the Hallé on the short-recoil principle. Gas-operated rifles, like the Hotchkiss and Colt machine guns, have fixed barrels and are worked by a portion of the powder-gases which is allowed to escape from the barrel through a small hole near the muzzle, thence entering a cylinder and working a piston in connexion with the breech mechanism. No automatic rifle has as yet (August 1910) been issued as a service weapon by any power, the problem of ensuring certainty in action under service conditions—i.e. with dirt and dust in the working parts—being the principal difficulty.

**Great Britain.**—There are two principal types of Lee-Metford and Lee-Enfield rifles in the service, the "short" and the "charger-loading." The former is carried by all units (cavalry included) of the regular army, by the yeomanry cavalry of the Territorial Force, and by units of the Rifle Volunteer Force. The latter is used by the infantry of the Territorial Force. There exist, further, the older, non-charger-loading Lee-Metford and Lee-Enfield rifles, a few carbines of the same type, and some Martini-Metford and Martini-Enfield carbines which have the .303 barrel and cartridge with the falling-block Martini action. 45 Martini-Henry rifles and carbines, and even Sniders, are still used by local police forces in some of the smaller colonies.

The long charger-loading Lee-Enfield is converted from earlier patterns by the addition of a charger guide, the stripping of the bolt-cover, and improvements in the sighting. The action of the breech mechanism \(^1\) is as follows (the breech mechanism of the short rifle being practically the same): The breech is closed automatically by the head (10) in a bolt; and the bolt-head (10) abuts against the base of the cartridge when the rifle is loaded, and when the knob is turned the whole is locked. On the right side of the bolt is a solid rib, and on the left side a lug; the lug (8) catches the locking lug (12) in the receiver, and the rib (9) fits the seating lug (11) in the receiver. Underneath the bolt there are two recesses and a stud. The bolt-head is screwed to the bolt and is fitted with an extractor claw. The bolt-head, instead of being rigidly attached to the bolt, is so designed that the extractor swings outwards while the bolt is revolved. Inside the bolt is the arrangement of striker (V) and spring (W), and at its rear end, forming the working connexion between trigger and striker, is the "cocking-piece" (X) which is a safety catch (not in the old pattern rifle illustrated). This cocking-piece (which cannot turn) has a long tongue projecting to the front, lying along the under side of the bolt, and the front end of this tongue (Y), called the "full-bent, \(^1\) The annexed figures show the old pattern weapon. In both the existing patterns a safety catch is fitted, the magazine spring is of a different shape and there is no bolt-cover. But the essential parts of the action remain the same.
engages the nose of the trigger sear when the weapon is loaded. A groove in the tongue, called the "half-bent" (Z), serves as a half-cock arrangement, and could be used as a safety-catch if the proper safety-catch were damaged. The trigger sear (K) is a bell-crank lever, the upper long arm of which is put in and out of contact with the "full-bent," and the lower or short arm is connected to the trigger. The magazine holds ten cartridges, which rest on a platform, under which is the magazine spring that pushes the platform and cartridges up. A cut-off is fitted in the "long," and in some marks of the "short" rifle. This is as follows: enabling the magazine to be kept full while the rifle is being used as a single loader. But the present musketry regulations forbid single-loading, and the cut-off is now only closed for special purposes, such as unloading a single cartridge (muzzle, &c.) without unloading the magazine. The magazine is loaded by inserting a charger in the "charger guides" (these, attached to the body, form a sort of bridge over the bolt) and forcing down the strip of cartridges into the magazine (charger guides not shown in diagrams). The action of the trigger sear, and the bolt-head remain unaltered. Single cartridge (muzzle, &c.) without unloading the magazine. The magazine is loaded by the right of the body and the extractor attached to it flings out the fired cartridge-case. Another cartridge then comes up from the magazine and lies in front of the bolt-head ready to be pushed home.

At this moment (the beginning of loading) the stud on the cocking-piece engages the nose of the trigger sear, and as the bolt is pushed forward the tongue or full-bent comes against the nose of the trigger sear and is held there, while the rest of the bolt mechanism goes on. Thus between the moving bolt and the fixed cocking-piece the spring is greatly extended, and when the bolt head, in the front of the ribs engage the resisting portions of the body a last forward push is given to the bolt and the spring is completely compressed, ready to propel the striker forward when the full-bent is released from the nose of the sear. Figs. 5-8 of the "short" rifle are arranged to show this mechanism.

Figs. 5 and 6.—Lee-Metford.

Instead of the older single pull-off of the trigger, the "short" rifle, like many Continental weapons, has a double pull-off. This is provided for by suitably shaping the portion of the trigger which is in contact with the arm of the sear. The "short" rifle has also a somewhat different pattern of safety-catch.

The sights of British service rifles up to 1903 were of a peculiar type, called the "eyecorn" of triangular shape, and the back-sight a plain leaf with sliding bar into which a V was cut, the tip of the fore-sight seen in the middle of the V being brought on to the mark. In the long charger-loader this form of back-sight has been greatly modified, and in the "short" rifle it has been altogether abolished. The eyecorn fore-sight has been replaced in both cases by an upright blade, protected from injury by two ears or wings, and the V by an U aperture. For elevation the long rifle has a short slide to slide the head, but the movement of this slide is controlled no longer merely by its tight fit but by a clamping screw. The sight of the short rifle is larger and also quite different in appearance and principle. There is a leaf on it, and on a slide, but the sliding principle, and the clamping mechanism, have been abandoned in the short rifle, as the vibration of the barrel on discharge is more or less checked by the extra weight of the bayonet, and the accuracy of the rifle differs accordingly as it is fired with or without the bayonet fixed. With the short rifle the bayonet is fixed to two metal fastenings, a plug for the ring and a catch for the handle.

Continental European Rifles. These are for the most part of the Mauser and the Mannlicher types. The Mauser is a bolt action rifle with box magazine. The bolt is simple, without separate bolt-head, and is held by two bolt-lugs at its front end engaging with recesses in the body (the German Mauser has an extra lug near the rear end). Near the rear end there is a cam-shaped recess, which, engaging with a stud on the cocking-piece, initially forces back the cocking-piece and spring when the bolt is removed. When the bolt lever is turned up and the bolt begins to rotate, the cocking-piece and bolt plug, which together form the connexion between the bolt and the trigger, do not rotate, but are forced back slightly, hence the compression of the spring again begins. Then, the bolt lever being so shaped as to bear against an inclined plane edge on the body, the bolt comes back a little, and with it the extractor jaw and the empty cartridge-case. Lastly, when the bolt has turned through a right angle, all studs are opposite their slots and ways in the body, and the bolt can be drawn back. At the farthest rearward position of the bolt the cocking-stud on the cocking-piece is well behind the nose of the trigger sear, and is thus held when the bolt is turned back, the spring being entirely compressed.

All Mauser rifles have a safety-catch and a double pull-off. None have cut-offs except the Turkish pattern. All are constructed for clip or charger loading, but the box magazine contains only five cartridges against the Lee-Enfield's ten. Mauser rifles, which are nearly universal in the world's armies, are used in the German, Belgian, Spanish, Portuguese and Turkish armies, and were also used by the Boers in the South African War.

The type adopted by each of these nations differs from the rest in details only. The German rifle is a long guardless sword bayonet fixed to the fore-end only and not connected with the barrel, and a peculiar form of back-sight, which bears some resemblance to the
slide and bed arrangement of the British "short" rifle. The special feature of the Belgian Mauser is a thin steel casing for the barrel, to the change of leverage, power at the commencement and rapidity at the end of the pull. The weapon is a clip loader. The Dutch.

Fig. 9.—Belgian Mauser. (Text Book of Small Arms, by permission.)

Fig. 9a.—Spanish Mauser. (Text Book of Small Arms, by permission.)

which is supposed to act as a hand-guard or cooler and to free the barrel from disturbing influences due to its connexion with the fore-end; but it is expensive, and if strong adds unduly to the weight of the weapon. The older German magazine rifle, pattern 1889, had a barrel casing, but this was given up when the new 1898 pattern was introduced. The bayonets of the Belgian and Spanish patterns are very short knives.

The Mannlicher rifle, which is extensively used for sporting and target work, has been adopted for military purposes by various states, notably Austria-Hungary. Both the 1890 and

Fig. 10.—German Mauser, 1898. (Text Book of Small Arms, by permission.)

1895 patterns of Austrian Mannlicher have "straight-pull" bolts; that is, bolts which are not turned for locking. The bolts are in two parts, which "telescope" into each other. In the 1890 pattern (see fig. 12), when the bolt I is home against the cartridge and the "lever cylinder" Y, which carries the bolt knob, is further pushed forward, the hinged block R is caused to drop in front of the resistance-piece Q, and so locks the bolt I against the cartridge. In the 1895 pattern (see fig. 13), the final pushing forward of the lever cylinder causes the head of the bolt I to turn and projections on its head to lock into recesses SS just in rear of the breech. The turning is due to helical feathers (20) on the inside of the lever cylinder Y working in grooves in the rear of the bolt I. The 1890 pattern has a double pull-off. It will be seen from the figure that as the trigger is pulled the bearing is taken first at (8) and then at (9). This gives, owing

Fig. 11.—Austrian Mannlicher, 1895. (Text Book of Small Arms, by permission.)

United States.—Up to 1904 the U.S. army had the Krag-Jørgensen rifle, in which, as shown in fig. 17, the magazine was placed horizontally under the breech action. At this time most of the second line troops had still the old-fashioned (black powder) Springfield rifle, a single loader with a hinged block similar to the rifles of the "sixties" in Europe, such as the Snider, the Tabatière and the Werndl.1 Since 1904, however, the regular army has been re-armed with a short rifle (fig. 18) which in its action has a general resemblance to a Mauser. As at first issued, the new Springfield had a rod bayonet which, when not in use, lay within the fore-end of the stock, and when required was run forward and fastened by a catch. This novelty was, however, soon discarded in favour of a sword bayonet 16 in long. The United States navy had until about 1900 the Lee "straight-pull" rifle. The Russian "3-line" and the Japanese

Fig. 12.—Mannlicher, 1890.

Rumanian and other Mannlichers have not straight-pull bolts, but the usual turn-over levers and locking-lugs.

Fig. 13.—Mannlicher, 1895.

France.—The breech mechanism of this rifle (see fig. 15) calls for no special remark. Its bolt is very similar to that of the British rifle. Its special peculiarity is the once popular tube magazine under the fore-end. This has many defects as compared with the box magazine. It is more cumbersome for the same number of cartridges; its feed and cut-off mechanism is very complicated; the balance of the rifle is altered as the magazine empties; the placing of the cartridges base to point, even when the bullet has a flat point, is not unattended with danger, especially when the magazine is full and the spiral spring strongly compressed; lastly, loading by any form of charger is practically impossible.

Fig. 15.—Lebel Rifle.

1 The Springfield was, however, a much improved model of this kind of weapon, dating from 1884 only.
"30th year" (1900) and "38th year" (1907) rifles are bolt-action weapons, with no special peculiarities. The Swiss rifle (Schmidt-Rubin) is a remarkable weapon of the straight-pull type, short, and possessing a relatively low velocity.

The Use of the Rifle in War.—
The study of "musketry" as distinct from target shooting may be said to date from the Franco-German War. Previously military students and practical soldiers concerned themselves with the tactical question of fire-power—fire versus shock, bullet versus bayonet, and so on—than with the technical question of its application. This was natural enough in the days of short-range fighting. But when bullets began to cause losses at 1000 yds. and more from the firing point, formations that presented the least vulnerable target had to be discovered and tested, aiming grew more difficult as the range increased, and firing by word of command in large units became practically impossible. The very accuracy and range of modern weapons involved new problems. The necessity, in the larger area of effective fire, of setting the sights to the distance of the mark made further demands on fire-discipline and brought up the difficult problem of judging distance. The possibilities of varying the rate of fire conferred by the magazine rifle also demanded close study. Each war, as it came, produced fresh evidence as to what was possible and what was not in matters of fire-control, the best rate of fire for effect, the range at which fire should be opened, and other half-tactical, half-technical problems. Thus, although many points still remain in the region of controversy, certain ideas and principles are almost universally accepted as the basis of service musketry.

The leading idea is that of the "cone of dispersion." A modern rifle, even fired from a fixed rest under good conditions, will not place shot after shot in the same spot, but the shot-marks on the target form a more or less close "group." When to this error of the rifle and the ammunition there is added the personal error of the marksman, the group is larger, and in the collective fire of a squad it is larger still. Now the trajectories of bullets that do not strike in the same place naturally do not coincide, and the group on the target is represented in the air by a cone or sheaf of trajectories. The bullets of this sheaf striking the ground on either side of the target form on the ground a much elongated ellipse. The ellipse containing 90% of the bullets fired is called the beaten zone. It is usual, however, to calculate from the "effective" zone, or that which contains 75% of bullets. Within the "effective" zone, and at its centre, is found the closely grouped "nucleus" of 50% of bullets. With the British .303 rifle in collective fire, the depths of these zones are:

<table>

<td>140</td>
</tr>
</tbody>
</table>

The target aimed at and sighted for is at the centre of the zone (see fig. 19). The height of the grouping on a vertical target compared to the depth of the groupings on the ground is of course proportionate to the tangent of the angle of descent; hence, small as is the group on a vertical target at 500 yds., the beaten zone is no less than 320 yds. deep. For the same reason, the range, and consequently the angle of descent, increases, the beaten zone diminishes in depth. Another factor is the "dangerous space." This is the space between "first catch," i.e., the point at which the bullet (in a sheaf, the lowest bullet) comes low enough to catch a man's head, and "first graze," that at which it strikes the ground. The extent of this dangerous space varies of course with the height of the man's head. In the case of a mounted man, at 1000 yds., it is 105 yds., while in that of a sharp-shooter lying down, it is only 13 yds. (in addition of course to the beaten zone). As nowadays nearly all targets, on service, are lying or three-quarters concealed figures, the dangerous space as compared with the beaten zone is at such a range too small to count as a factor. It is, however, important at shorter ranges, 500 yds. and under (700 and under with the new pointed bullets). Here the advantages of flat trajectory make themselves felt. Within this distance the bullet is at no point in its career too high to be dangerous to a standing man or a horseman. A lying figure is in danger at any distance beyond 350 yds. if the sights are set to 500 yds. (front half of effective zone 105 yds., dangerous space 52 yds.). This is the theory underlying the 500 yds. "fixed sight" or "battle-sight," a setting which holds good for all less ranges, and can be put on the rifle instantly and without looking at the back-sight graduations.

These facts, taken in conjunction with the imperfections of the most skilful individual marksmanship and the chances of wrong estimation of distance, are the basis of the musketry training and practice of to-day. At the School of Musketry, Hythe, the standard of judging distance is "not more than

Note.—C.N. = Cupro-nickel. N.G. = Nitro-glycerine.

100 yds. wrong at any range." Now at 1000 yds. an error in judging distance of 13 yds. above or below the true range will cause all the shots of a particular rifle to fall away from the target, and the better the marksman—i.e. the closer his group—the more necessary is perfection in judging distance, a perfection which in reality seems unattainable. The British musketry regulations therefore lay it down that the individual marksman's fire at service targets is unprofitable at ranges of more than 600 yds. Beyond that distance collective fire, controlled and directed by an officer or non-commissioned officer, is the rule. The question as to whether fire is to be opened in any given set of circumstances is decided by the fire-director, who considers first whether the probable error in judging distance is greater than half of the effective zone for the estimated range. If it is so, he must order "combined sights," i.e. half of the units under his command use one elevation, the rest another, which method artificially increases the dispersion of the bullets and thereby the probability of the target being included in the zone. This, however, makes the fire less effective, and in practice cannot be profitably used by any body of rifles of less than 80 or 100. The commander of only a single section, therefore, however tempting the target, must refrain from opening fire at all. At medium ranges, however, controlled and directed fire is effective, and at such ranges troops should still be sufficiently in hand to execute the fire-director's orders. Within decisive ranges fire-direction has to give place to fire-control. All that the strongest commander can enforce is the opening and ceasing of fire when he gives the order, and success is sought through making the individual soldier skilful at rapid and snap shooting. Black bull's-eyes on white targets are now used only to teach men to make uniformly good shooting, which is shown by the closeness of the shot-grouping. The rest of the musketry course is fixed against grey-green "head and shoulders" targets or brown silhouettes, and consists of slow, rapid and snap shooting, from behind cover, at disappearing or running targets, &c. In 1909 special attention began to be paid to visual training, both as an aid to judging distance and as an actual ingredient of fire-discipline. A method of indicating targets which originated in the French army was adopted and improved upon, consisting essentially of giving two or three conspicuous "auxiliary marks," in artillery language, and naming the target with reference to them. Judging distance is generally associated with fire-discipline practices, and men are frequently exercised in locating and ranging upon a hidden skirmisher, 300-800 yds. away. Perhaps the most important modification of musketry training, within recent years, has been the adoption of rapid fire in "bursts," as the normal procedure for infantry, instead of slow continuous fire. The complete cessation of fire at intervals enables the leaders to observe the
progress of the engagement, to change their target, to economize ammunition, to select the ground for the next rush and the next burst of fire, and to regain control of the men, whom a prolonged fire-fight hypnotizes and rivets to the ground. The chief use of "slow" fire, which is generally employed by skirmishers working in pairs, is to keep the enemy under; the storm of well-directed "rapid fire" the fire-director should hold in his own hands, ready to release it at the right moment. Slow fire averages 3 rounds a minute, rapid (aimed) 8–12. The configuration of the ground has often a great influence on fire effect.

If the target is on a sharp forward slope, the beaten zone is greatly diminished in depth, ranging errors are no longer neutralized by the flatness of trajectory and (the bullets meeting the ground at a steeper angle) the dangerous space is reduced; if, on the other hand, the slope descends gently in rear of the target so that the falling bullets instead of making a pattern upon the ground, skim along parallel to the surface, the zone is increased. For instance, at 1500 yds., if there is a reverse slope of about 5° in rear of the target the depth of the beaten zone is tenfold that of the same range on level ground. Similarly if the target is on the crest of a hill and the firers below, the "over" half of the cone of fire may graze the reverse slope or pass far above, according as the reverse slope is gentle or sharp with respect to the line of sight.

The normal position for the firing infantryman in action is kneeling; the kneeling position is used for firing from behind cover, the sitting for firing down hill. Standing, formerly the usual position, is now employed chiefly for firing behind cover with the rifle rested, and for snap-shooting during an advance when it is undesirable to halt and lie down. As regards cover, it may be mentioned that well-covered or intrenched troops generally shoot less accurately than troops in the open, the soldier in security being loth to expose himself long enough to take careful aim. This was particularly noticeable in the Russo-Turkish War, and its effect is to create a zone of unaimed fire behind the assailants' fighting line, which sometimes causes serious losses to his supports and reserves. The relation between the cone of dispersion of peace-time experiments, even when these are specially designed to establish that relation (for example, series fired in France by third-class shots, after a long march without food), has never been satisfactorily established. An arbitrary figure of one-tenth or one-twentieth of peace-time effect has generally been assumed as representing war results, but some think that however the normal zone may be multiplied or divided, no relation can be found between peace and war effect, and that in battle the brave men aim and fire as if on the practice range, and the rest fire absolutely at hazard. From a musketry point of view, this brings again into the foreground the question of distance-judging, as, if the sights be wrongly set, the more accurate the fire the less its effect; and
RIFLE

mistake would nullify even the small amount of aimed fire that can be reckoned upon. Peace-time experiments have their value—and it is very great—in establishing data as to the effect of fire on troops in different formations, the limits of permissible error in ranging, &c., on the principle that of two methods, that which is proved to be better in peace would in much the same proportion be found better in war. (C. F. A.)

See T. F. Fremantle, The Book of the Rifle; W. W. Greener, The Gun and its Development; the British official Text Book of Small Arms (1906); and Muzzle Regulations (1909); C. B. Mayne, Infantry Fire Tactics; and Taffin, "Tir de Combat" (Revue d'infanterie, 1909).

**Match or Target Rifle.**—The sport or pastime of target shooting has many times changed its character, owing to the steady improvement in the rifle and the different ranges or distances at which shooting is practised. Range usually governs the construction of the target rifle, long-range rifles not being necessarily the best weapons for a short range of, say, 200 yds. Limitations—such as the amount of powder charge, weight of bullet and rifle—are also usually imposed in order to place all competitors on equal terms. The long-range match rifle, therefore, is the superior and most satisfactory shooting instrument. The ordinary target rifle is a hybrid arm, combining the points of the long-range match, modern military and best sporting rifles. The miniature match rifle is used for short-range practice.

Shooting at fixed marks has been practised continuously in Switzerland from medieval times. A club ("Société de l’arquebuse et de la Navigation") has existed in Geneva since 1474; and the Zürich "Schützen-Gesellschaft" since about the same date. It is not clear at what period rifles were introduced in these clubs. From the beginning of the 19th century up to 1844 the rifle generally used in Great Britain had a polygrooved barrel -630 in. in diameter, with spherical ball, and the arm weighed from 11 to 15 lb. It was not fired in military fashion, but had a handle extending downwards fixed in front of the trigger-guard, which was grasped by the left hand, the left arm being steadied against the body. This method of shooting is still sometimes followed by Swiss and German riflemen. Target shooting as a sport or business was rarely practised in Great Britain until after the formation of the Volunteer Force in 1859. The inauguration of the "National Rifle Association" in 1860 opened a new and most important era in the history and development of the rifle. This institution was established "for the encouragement of rifle clubs and the promotion of rifle shooting throughout Great Britain. . . . As a national pastime to make the rifle what the bow was in the days of the Plantagenets, the familiar weapon of those who stand forth in the defence of their country." The first meeting of the N.R.A. was held at Wimbledon in 1860. The first shot was fired by Queen Victoria 1 from a Whitworth rifle on a machine rest, at 400 yds., and struck the bull's-eye. The Whitworth muzzle-loading rifle won many of the important prizes at this and subsequent meetings prior to 1871. Its most important features, arrived at after exhaustive experiments, were a smaller bore of -450 in., with a twist of rifling of one turn in 20 in., and an elongated mechanically fitting projectile. Long-range rifle construction is also largely indebted to Whitworth for the highly accurate and superior tools and processes introduced by him in this branch of manufacture.

In 1866 and after, Metford's system of hardened expanding bullets and shallow rifling gradually superseded the mechanically fitting system of Whitworth, and the Whitworth rifle gradually lost its position. In 1861, the Henry grooving for a cylindrical bullet, a modification of the Whitworth, first appeared. In 1864, Rigby, with a five-grooved rifle and a mechanically fitting bullet, tied with the Whitworth rifle in the preliminary rifle trial of the N.R.A. at 1000 yds., and in a subsequent trial took the first place. By 1871 the Whitworth rifle had given place to the Metford system with hardened cylindrical bullets, shallow rifling and increasing spiral. In 1867 the modern breech-loading rifle with a metallic cartridge was first introduced. The Metford system of rifling greatly assisted its development.

In this year Rigby also produced a new model long-range rifle designed on the lines followed by Metford. In 1869 the Henry barrel came to the front. In 1870 the Martini-Henry, the new service arm, won the duke of Cambridge's prize, the extreme range in this competition being 800 yds. In 1871 the Snider breech-loader replaced the Enfield muzzle-loader, and the Martini-Henry replaced the Whitworth in the later stages—800, 900 and 1000 yds.—of the Queen's prize. The Metford barrel was also used in breech-loaders, and the duke of Cambridge's prize—for the first time fired at 1000 yds.—fell to it. During the twenty-three years from 1871 to 1894 the Metford military match rifle only four times failed to win this prize, while it took the first place two times. In 1872 and 1873 marked a decided advance in the military breech-loader, though for fine shooting the muzzle-loader still seemed hard to equal. In 1875 a team of American riflemen first visited Wimbledon with "army-pattern" breech-loading rifles, which were cleared out after every shot, and met with considerable success. A feature of their shooting was the "back position," then a novelty. In 1877 the superiority of the cleansable and cleansed breech-loader over the increased fouling of the muzzle-loader was clearly demonstrated, though the muzzle-loader did not at once disappear. In 1878 the highest scores ever made with the muzzle-loader in Great Britain were recorded, greater care in cleaning the rifle after every shot being observed.

In 1883 the N.R.A. Council altered the conditions, wiping out after every shot was forbidden, but muzzle-loaders were not disqualified. The result was that the American type of rifle disappeared. The poor shooting of the Martini at 1000 yds. induced the Council to take the retrograde step of reducing the maximum range for the Queen's prize to 900 yds. In 1890 the N.R.A. Council met at Bisley. This year was noticeable for the excellent shooting made in the "any" rifle competitions by the Gibbs-Metford match rifle, particularly at 1000 yds. range. The accepted type was -461 calibre; 7 grooves -0045 in. in depth; 80 grains of special black gunpowder, and a bullet of 570 grains. In 1892 and 1893 the Lee-Metford -303 rifle with cordite ammunition was first used by the army teams. In 1890 and later the Hon. T. F. Fremantle, Captain Gibbs and some others used Metford's copper-coated bullets in the Gibbs-Metford rifle with success. In 1895 many match rifle shots followed their example. In 1895 and 1896 the -303 was equaled, and in some instances beaten, by the smaller-calibre Mannlicher rifle. This was partly due to faulty Lee-Metford ammunition. The -303 now proved its superiority to the -450 Martini, especially at the longer ranges. The Bisley meeting of 1896 practically closed the series of contests with both the Martini and the military match rifles. The Volunteers were thenceforth armed with the -303.

The results of the Bisley meetings since 1895 have proved that rifles of the -303 class, the British -303 rifle particularly, are not so good for match rifles pure and simple as the larger bores using black powder. The light bullets are more subject to deflection by the wind at long ranges than the heavier speed-retaining bullets of the larger bores. No nitro-powder used appears to have equalled the black powder in regularity of shooting. At the same time the object of the N.R.A. competitions is to encourage the use of the military service rifle in the first place, and in the case of the "any" rifle competitions to encourage the production of weapons of the highest efficiency for military purposes. Acting on these principles the rifles allowed by the N.R.A. regulations (1907) are classed as follows—

Class I.—Service rifle (S.R.): government pattern -303 magazine rifles;

---

1 The "Queen's" or "King's" prize is the highest distinction to which a rifle cannot attain. The competition is one of three stages, the first and second eliminating all but the best 100 competitors. The bronze medal of the N.R.A. is awarded to the highest scorer in the first stage, the silver medal to the leader in the second, and the King's prize and N.R.A. gold medal to the winner in the last stage: 71 shots in all are fired at distances up to 1000 yds., and the winners' scores of late years have been 320 to 325 out of a possible 355. Only the service rifle is allowed.
sights strictly in accordance with service pattern.\textsuperscript{1} \textbf{Class II.}—Match rifles (M.R.): any breech-loading rifle complying with the following conditions: maximum weight of barrel, 3/4 lb.; maximum calibre, 325; stock sufficiently strong for service purposes, and without pad or shoe on the heelplate; minimum pull of trigger, 4 lb.; sights, of any description. \textbf{Class III.}—Military breech-loading rifles (M.B.L.): any rifle, that is either (a) the regulation military rifle of any country; or (b) a breech-loading rifle complying with the following conditions: maximum weight, exclusive of bayonet, 8 lb.; maximum calibre, 315; minimum pull of trigger, 4 lb. Sights may be of any description except telescopic or magnifying, but must be fixed to the barrel and must be strong enough for military purposes. \textbf{Class IV.}—Sporting rifles: calibre, any; minimum pull of trigger, 3 lb.; sights, open or such as are sanctioned by the council or committee. The Lyman back-sight and the Beech combination fore-sight have been sanctioned. No lateral adjustment of fore- or back-sight is permitted. The miniature rifles allowed fall into two classes, "military," with open sights, only, and "any," with no restrictions as to sights except that magnifying and telescopic sights are forbidden.

\textbf{Modern American Type of Rifles.} In America, according to some authorities, there are three recognized departments of target shooting—namely off-hand shooting; shooting from a simple rest; and shooting from a machine rest, with telescopic or any other sight. For the first two classes small-bore rifles of 380 calibre or under only are used. The usual weight is from 8 to 10 lb., with 28- or 30-in. barrel. Light charges for the shorter ranges are used. In the 380 bore only 55 grains of powder with a 330-grain bullet is employed. In the second-class contests, from a simple rest, the barrel is longer and the weight increased to just under 12 lb. The bore is generally 380. The usual range is 200 yds. The third-class shooting from a machine rest, generally with telescopic sights, is not much practised. Every kind of rifle is employed, usually of large bore and weighing from 20 to 60 lb. The long-range breech-loading match rifle, with which so much fine shooting was done when wiping out after each shot was allowed, weighed about 10 lb.; the breech mechanism, any falling block, as the Sharp, Farquharson, Deely, and Edge or Wiley, that admitted the insertion of the cleaning rod at the breech; length of barrel, 32 to 34 in.; seven or more grooves -003 to -005 in depth with a complete turn in 20 in. A sharp continual spiral and very shallow grooves constituted the feature of the American plan. Rigby's plan was similar, with one turn in 18 in. and eight grooves, the lands being about half the width of the grooves. In the Wiley the grooves were fewer and wider. The Metford is an increasing twist, starting with one turn in 60 in. and finishing with one in 20, or sharper. The usual bore of the American long-range rifle was -458 or -461; powder, 76 grains of special "fouling" rifle powder; elongated cylindrical bullet of 340 grains. The pull-off was under 3 lb. During recent years smaller-bore smokeless-powder rifles have also been used.

\textbf{Continental Match Rifles.}—The target rifle used by continental marksmen for medium ranges is a modification of the old pattern Swiss rifle, with scroll guard, hallowed butt plate and hair trigger. This latter, a mechanical device to free the trigger from the sear without sufficient pull on the trigger to influence the aim, is disallowed in military arms.

\textbf{Sporting Rifles.}—Prior to 1845 smooth-bore guns with double charge of powder and an ounce spherical ball were generally preferred to rifles for sporting purposes and for large game; 16-bore muzzle-loading rifles were occasionally used by British sportsmen in the East Indies before that date, firing 13 drs. of powder with a spherical ounce ball. These rifles were sighted to 200 yds., but the trajectory was high and the penetration weak; they were also difficult to load when foul. The twist of the rifling was also too rapid, causing the bullet to strip with heavy charges of powder. According to Captain Forsyth and others, up to 1860 there was no known rifle suitable for sporting purposes in India. Rifles of 12-bore gauge, firing a spherical ball, were subsequently made, with broad and shallow grooves of arms about 10 in. of the same diameter as the bore, was loaded with a thin patch that took the grooving. These rifles proved very successful, possessing velocity equal to a smooth-bore of the same calibre, accuracy for sporting distances, flat trajectory and great striking power. In 1855 W. Greener produced the "Cape rifle" for South African sport, calibre -450 or -500; rifling, two deep grooves with one turn in 26 in., with a flanged bullet to fit the grooves; weight, 12 lb.; sighted up to 1200 yds. This rifle was successful, and others were built by Purdey, who in 1856 named the pattern "Express Train." Since that date the word "express" has been generally used to denote a rifle possessing high velocity, flat trajectory and long fixed-sight range.\textsuperscript{2} In America small-bore rifles were used earlier in the 19th century. The celebrated Kentucky rifles were of various sizes, firing spherical balls of 30, 60 and 40 to the lb., and were renowned for their accuracy and fixed-sight range up to 100 yds. Some maintain that the express rifle was developed from the Kentucky mode of the small-bore rifles. The term may be defined as a breech-loading rifle with a height of trajectory not exceeding 4½ in. at 150 yds., with a muzzle velocity of at least 1750 f.s. These rifles are usually 5- to 7-grooved, double-barrelled, with 26- to 28-in. barrels of -360, -400, -450, -500 and -577 grains, weighing respectively from 6½ to 7 lb., 7 to 8 lb., 7½ to 9 lb., 8½ to 10 lb. and 10½ to 12½ lb. The respective average charges are bullet, 150 grains; powder, 50 grains; 200 and 82; 270 and 110; 340 and 130; 520 and 160; the fixed-sight ranges, 130, 160, 150, 130 and 120 yds. Double and single express rifles of -303 bore with 26-in. barrels are also made.

Since the invention of cordite powder and the advent of the small-bore high-velocity rifle for military purposes, the variety of sporting rifles with different-sized bores has increased. Sporting cordite express rifles are now made, both single- and double-barrelled, of the following calibres: -256, -265, -276, -303, -310, -360, -370, -375, -400, -450, -500, -577 and -600. Some of these calibres, such as -300, -577 and -600, are seldom used with cordite. The -450 cordite express is the largest bore high-velocity rifle recommended.

The modern small-bore military rifle already described possesses all the best qualities of an express sporting rifle—namely accuracy, flat trajectory, high muzzle velocity and long point-blank or fixed-sight range up to 200 yds. The muzzle velocity of the -303 bore with black powder is 1850 f.s.; with cordite, 2100 f.s. The hollow-pointed or sliq expanding bullet is generally used in these high-velocity rifles, as in the black-powder express, for ordinary sporting purposes, with the solid metal cartridge-case. The pointed bullet is also sometimes used, generally with the -375 and -475 calibre rifles, and gives an increased muzzle velocity of 2500 f.s. The trajectory of the cordite rifle is stated to be 10 in. flatter at 200 yds. than that of a black-powder rifle of similar calibre and corresponding charge. The variety of bores in sporting rifles is due largely to restrictions on the importation of arms, and to the military calibres (especially -303) into India and South Africa.

The sights of sporting express rifles are of some variety, and are usually designed and made with special care. The open V

\textsuperscript{1} The term "point-blank range" is often used in this connexion. Strictly speaking, there is no such thing as "point-blank range," the bullet commencing to drop immediately it leaves the muzzle of the rifle. The point-blank trajectory of the bullet if fired horizontally is therefore always a downward curve. The higher the muzzle velocity the flatter is this curve. The "fixed-sight," or so-called "point-blank" range, is usually taken at such range, generally an inch or two, where although the bullet is still expanding, and with such elevation as renders the amount of drop of the bullet or curve of its path practically immaterial for sporting purposes, say a maximum of 4½ in. At shorter range this curve would therefore take the bullet so much above the line of fixed-sight aim, and must where necessary be allowed for. With the high-velocity small-bore rifle the fixed-sight range can be increased to 200 yds. for the sporting rifle; and for military purposes in the field to 500 yds. and (with pointed bullets) even more.
back-sight on an ivory pyramid with two or three leaves up to 300 yds., and the enamelled bead fore-sight; are the most usual form. The more elaborate Lyman and Beech peep-sights are also popular. One or two varieties of telescope sight, attachable to the barrel, are also made by some leading gunmakers, and have been used with success in the field. Solid-drawn brass cartridge-cases are now always used for sporting rifles, except occasionally for some of the larger bores, in which paper cartridges may be used. The peculiarity of the express bullet is its hollow point, which is intended to ensure the expansion of the projectile on impact. This diminishes its penetration, but translates its velocity or energy into "shock." If greater penetration is needed, the leaden bullet is hardened with mercury or tin, or the military nickel-coated bullet is used. Explosive bullets filled with detonating powder were at one time used in express and large-bore rifles for large game. These are now practically abandoned, owing to their uncertainty of action and the danger in handling them. The use of the large 4- and 8-bore black-powder rifles is restricted to the hunting of large and dangerous game. These are usually double-barrelled. The 4-bore weighs from 14 to 16 lb with 20-in. barrels, and fires a charge of 12 to 14 drs. of powder, with a spherical bullet of 1500 grs. The great weight of this rifle is against its general use. The 8-bore rifle weighs from 17 to 15 lb with 20 to 24-in. barrels, with a charge of 8 to 12 drs. of powder, with a spherical ball. These rifles are accurate and effective up to 150 yds. Rook and rabbit rifles are usually single-barrel breech-loading rifles of from .220 to .380 bore, hammerless, ejectors. The range is ordinarily restricted to 200 yds.

Combined rifles and shot-guns are generally used in countries where the kind of game to be met with is not known beforehand, and by emigrants who can only afford one gun. These weapons are double-barrelled (.450 rifle barrel and 16-bore short barrel; or .500 rifle and 12-bore shot). Such a gun has many drawbacks, being too heavy for a shot-gun and too light for a rifle, with a bad balance. More modern combinations of the rifle and shot-gun are Holland's "Paradox," a smooth bore with the last three inches of the barrel ratchet-rifled, Lancaster's "Colindian" twisted oval bore, and Bland's "Europa" with "invisible," undulating rilling. All these weapons fire heavy bullets more or less accurately up to 100 yds., are also used as shot-guns, and are made double- or single-barrelled and of various calibres, 12-bore being the most common. There is also Greener's "under, and over," the rifle barrel being topmost (usually 16-bore shot-guns barrel and .450 rifle barrel). The Morris tube also employs a shot-gun to be fired either as a rifle or a large-bore as a special rifle for gallery practice. The automatic principle has not yet been applied to sporting rifles.

Miniature Rifles.—In 1905 a War Office miniature or cadet rifle for instruction purposes was officially adopted by the British military authorities. The details of this rifle were determined by a committee, upon which the National Rifle Association and the Society of Miniature Rifle Clubs were represented. It is a single-loading bolt-action rifle of .22 calibre with military sights (the aperture sight being barred), shooting a rim-fire cartridge having a 40-gr. bullet propelled by 5 grs. of black gunpowder or its equivalent in some smokeless explosive. It is used at ranges from 25 yds. up to a maximum of 200 yds. The official adoption of such a rifle was largely due to the civilian rifle club movement, which was the outcome of the South African War, and in which the Society of Miniature Rifle Clubs has played an important part. Until the recent official adoption of the miniature rifle, the council of the N.R.A. regarded marksmanship with the service rifle as its main object of encouragement, and the service rifle itself as the orthodox weapon. The Society of Miniature Rifle Clubs, on the other hand, makes this the chief object of the use of low-power rifles its special object, with few restrictions as to type of sights, rifle or ammunition. Numerous civilian rifle clubs have adopted the .22 calibre rifle, in many cases with aperture sights, with marked success, and British rifle-makers were encouraged to cater for this new demand for low-power rifles. Such weapons can be far more widely and generally used than the ordinary service weapon, owing to their smaller cost, cheaper ammunition, absence of recoil, and their convenience for use at short covered ranges in crowded centres of population. In many parts of Great Britain there is practically no alternative between low-power short-range practice and no shooting at all. The N.R.A. has now admitted the miniature .22 calibre rifle upon equal terms with the service rifle. The miniature rifle has, to some extent, taken the place of the Morris tube and "adaptors" previously used for rifle practice at short ranges.1 The Morris tube consists of a small-rifled barrel, usually chambered for the 297/320-bore cartridge, and capable of being fitted inside the barrel of the ordinary service weapon, which thus becomes available as a miniature rifle for short-range practice. The Morris tube has been adopted by the British War Office, and affords an excellent means of training the recruit. "Adaptors" are dummy cartridge-cases fitted into the breech of the ordinary rifle, by means of which a shorter cartridge firing a lighter charge of powder, but with a bullet of the same calibre as the rifle, can be used for short-range practice. One of the first English miniature target rifles was the "Sharpshooters' Club" rifle, on the Martini principle, of .310 calibre, manufactured and introduced by W. W. Greener, and suitable for ranges from 50 to 300 yds. This rifle was adopted by many rifle clubs, and also established a record in the miniature rifle competition at Bisley. Miniature rifle shooting has been much encouraged throughout the United Kingdom by the establishment of the Light Rifle Championship competition under the auspices of the Society of Miniature Rifle Clubs. In 1907 Queen Alexandra presented a cup for this event. (H. S.-K.)

RIFLEMAN-BIRD, or Rifle-Bird, names given by the English in Australia to a very beautiful inhabitant of that country,2 probably because in coloration it resembled the well-known uniform of the rifle-regiments of the British army, while in its long and projecting hypochondriac plumes and short tail a further likeness might be traced to the hanging pelisse and the jacket formerly worn by the members of those corps. The cock bird is clothed in velvety-black generally glossed with rich purple, but having each feather of the abdomen broadly tipped with a chevron of green bronze, while the crown of the head is covered with scale-like feathers of glittering green, and on the throat gleams a triangular patch of brilliant bluish emerald, a colour that reappears on the whole upper surface of the middle pair of tail-quills. The hen is greyish-brown above, the crown streaked with dull white; the chin, throat and sides are light grey, the back and upper tail coverts are tawny yellow, and the outermost tail feathers are black with white outer webs. "Rifleman-Bird" is a name given by W. Wilson (Ili. Zoology, pi. xi.), specimens of both sexes were obtained by Sir T. Brisbane at Port Maquarie, whence, in August 1823, they were sent to the Edinburgh Museum, where they arrived the following year; but the species was first described by W. Swainson in January 1825 (Zool. Journal, i. 481) as the type of a new genus Ptilorhynchus,3 more properly written Ptiloris, and it is generally known in ornithology as P. paradisaea. It inhabits the northern part of New South Wales and southern part of Queensland as far as Wide Bay, beyond which its place is taken by a kindred species, the P. victoriae of J. Gould, which was found by John Macgillivray on the shores and islets of Rockingham Bay. Farther to the north, in York Peninsula, occurs what is considered a third species, P. alberti.

1 In the military forces short-range practice now takes two forms—practice with Morris tube or miniature rifle, and practice with the full-sized rifle and ammunition on specially protected 30-yd. ranges.

2 Curiously enough, its English name seems to be first mentioned in ornithological literature by Frenchmen—R. P. Lesson and Garnot—in 1828, who say (Voy. "Coquelle," Zoologie, p. 669) that it was applied "pour rappeler que ce fut un soldat de la garnison [of New South Wales] qui le tua le premier"—which seems to be an insufficient reason, though the statement as to how the first specimen was obtained may be true.

Some writers have amended Swainson's faulty name in the form Ptiloris, but that is a mistake.
very closely allied to and by some authorities thought to be identical with the *P. magnifica* (Vieillot) of New Guinea—the "Promerops" of many writers. From that country a fifth species, *P. wilsoni*, has also been described by Mr Ogden (Proc. Acad. Philadelphia, 1875, p. 451, pl. 25). Little is known of the habits of any of them, but the rifleman-bird proper is said to get its food by thrusting its somewhat long bill under the loose bark on the boles or boughs of trees, along the latter of which it runs swiftly, or by searching for it on the ground beneath. During the pairing-season the males mount to the higher branches and there display and trim their brilliant plumage in the morning sun, or fly from tree to tree uttering a note which is syllabled "yass" greatly prolonged, but at the same time making, apparently with their wings, an extraordinary noise like that caused by the shaking of a piece of stiff silk stuff. Verreaux informed D. G. Elliot that he believed they breed in the holes of trees and lay white eggs; but on that score nothing is really known. The genus *Philornis*, thought by Gould to be allied to *Climateris*, has been generally placed near *Epimachus*, which is now considered, with *Drepanornis* and *Seleucidas*, to belong to the Passerinae, or birds of passage, and in his *Monograph of that Family* all the species then known are beautifully figured from water-colours. (A. N.)

**RIGA (Esth. Ria-Lin), a seaport of Russia, 336 m. by rail S.W. of St. Petersburg, the capital of the government of Livonia. The Gulf of Riga, 100 m. long and 60 m. in width, with shallow waters of considerable salinity (greatest depth, 22 fathoms), freezes to some extent every year. The town is situated at the southern extremity of the gulf, 8 m. above the mouth of the Divna, which brings Riga, by means of inland canals, into water communication with the basins of the Dnieper and the Volga. Below the town the river divides into several branches, among islands and sandbanks, receiving before it enters the sea the Bolderaja river, and expanding towards the east into wider lacustrine basins. Having direct railway communication with the fertile parts of southern and south-eastern Russia, Riga has become the second port for foreign trade on the Baltic, ranking next after St. Petersburg. The port freezes on an average 127 days every year. The larger ships cannot reach Riga, and are unloaded at Ust-Dvinsk (formerly Dunamünde). By no means all the trade with the interior is transported by the railways; no inconsiderable portion of the goods is carried by water.

Riga consists of four parts—the old town and the St. Petersburg and Moscow suburbs on the right bank of the Divna, and the Mitau suburb on the left bank, the two sides being connected by a floating bridge, which is removed in winter, and by a viaduct, 820 ft. long. The old town still preserves its Hanseatic features—high storehouses, with spacious granaries and cellars, flanking the narrow, winding streets. The only open spaces are the market-place and two other squares, one of which, facing the citadel, is adorned with a granite column erected (1818) in commemoration of the defeat of Napoleon I. in 1812. The suburbs, with their broad and quiet boulevards on the site of the former fortifications, are steadily growing. The St. Petersburg suburb is the seat of the German aristocracy and merchant community.

Few antiquities of the medieval town remain. The oldest church, the Dom (St. Mary's), founded in 1215, was burned in 1547, and the present building dates from the second half of the 19th century, but has been thoroughly restored since 1883. Its organ, dating from 1883, is one of the largest in the world. St. Peter's church, with a beautiful tower 412 ft. high, was erected in 1406-9. The castle, built in 1494-1515 by the master of the Knights of the Sword, Walter von Plettenberg—a spacious building often rebuilt—is the seat of the Russian authorities. The "House of the Black Heads," a corporation or club of foreign merchants, was founded in 1330, and subsequently became the meeting-place of the wealthier youth of the place. Of the recent erections, the polytechnic, the exchange, the monument of the German writer, Johann Gottfried von Herder, who lived at Riga towards the end of the 18th century, the gymnasia (schools) of Lomonosov and Alexander I. and the large bonded warehouse are worthy of notice. The esplanade where the Greek cathedral built in 1877-84 now stands, the Währmann Paul, and the Prussian Pauli, the recently visited Riga gives name to an archiepiscopal see of the Orthodox Greek Church and to an episcopal see of the Roman Catholic Church, and is the headquarters of the XX. army corps. In the environs, Dubbeln and the sea-bathing resorts of Bildershofs and Majorenhof have numerous visitors in summer.

The population, which was 102,590 in 1867, increased to 168,728 in 1881 and to 282,943 in 1897, so that Riga now ranks seventh in the empire in order of population; 47% of the inhabitants are Russians, 25% Germans and 23% Latvians, with a small admixture of Esthonian Jews. The city has a commercial school (1903), a municipal library, an art museum with picture gallery (1904-5), technical and theological middle schools and a pilot and navigation school. Industrial activity has developed and includes railway-carriage works, works for the manufacture of machinery, oil mills and breweries. Owing to its communication by water and rail with the forests of White Russia and Volhynia, Riga is a great mart for timber. Flax and linseed also occupy a prominent place, Riga being the chief Russian port for the extensive flax-producing region of north-west Russia. Owing to the great railway which crosses the country from Riga to Smolensk, afterwards dividing into two branches, to Orenburg and Moscow, Riga is the natural centre of the export-trade and place of export for hemp coming by rail from west central Russia, and for corn, Riga merchants sending their buyers as far east as Tarnobrzeg, Ostrava, in particular, are extensively exported to Riga. The port trades mainly in flax, hemp, hempseed, barley, eggs, butter, oilcakes, hides, tallow, leather, tobacco, rags, bleaching and other items and add considerably to the total value of the exports, which increased from 12 million sterlings in 1851-60 to 8-14 million sterlings in 1901-5. The imports, consisting chiefly of salt, fish, wine, cotton goods, machinery, coal, oil, fruits and tobacco, are also rapidly increasing: whereas in 1851-60 they were valued at about 1½ million sterlings, in 1901-5 they reached 6-11½ millions sterlings.

History. — Riga was founded in 1158, as a storehouse at the mouth of the Duna (Divna), by a few Bremen merchants. About 1190 the Augustinian monk Meinhard erected a monastery there, and in 1199-1201 Bishop Albert I. of Livonia obtained from Pope Innocent III. permission for German merchants to land at the new settlement, and chose it for his seat, exercising his power over the neighbouring district in connexion with the Territory of the Knights. As early as the first half of the 15th century the young uncles of Albert, with elevating its own magistracy, and enlarged the walls erected during Albert's reign. It joined the Hanseatic League, and from 1323 refused to recognize the rights of the bishop and the knights. In 1420 it fell once more under the rule of the bishop, who maintained his authority until 1566, when it was abolished in consequence of the Reformation. Sigismund II., king of Poland, took Riga in 1547, and in 1558 the Russians burned its suburbs and many ships in the river. In 1561 Gotthard Ketteler publicly abdicated his mastership of the order of the Teutonic Knights, and Riga, together with southern Livonia, became a Polish possession; after some unsuccessful attempts to reintroduce Roman Catholicism, Stephen Bathory, king of Poland, recognized the religious freedom of the Protestant population. Throughout the 17th century Riga was a bone of contention between Sweden, Poland and Russia. In 1621 Gustavus Adolphus, king of Sweden, took it from Poland, and held it against the Poles and the Russians, who besieged it in 1656. During the Northern War between Sweden and Russia it was courageously defended (1700), but after the battle of Parnawa it succumbed, and was taken in July 1701 by the Russians. After the fall of Poland, Russia the capital of the Riga viceroyalty, but fifteen years later, when finally having been abolished, it was made the capital of Livonia. In 1812, the approach of the French being apprehended, the suburbs were burned.

(R. A. K.; J. T. Bk.)

**RIGAUD, HYACINTHE** (1659-1743), French painter, born at Perpignan on the 20th of July 1659, was the descendant of a line of artists. Having early lost his father, he was sent by his mother to Montpellier, where he studied under Petet and was helped by Ranc, then to Lyons, and in 1681 to Paris. There, whilst following the regular course of academical instruction,
Rigaud produced a great number of portraits so good that Le Brun advised him to give up going to Rome and to devote himself wholly to the class of work. Rigaud, who had already obtained the Grand Prix, followed this advice, and for sixty-two years painted at the rate of thirty to forty portraits a year, all carried through with infinite care by his own hand. His portraits of himself, of the sculptor Desjardins (Louve), of Mignard and of Le Brun (Louve) may be cited as triumphs of a still more attractive, if less imposing, character than that displayed in his grand representations of Bossuet (Louve) and Louis XIV. (Louve), while his beautiful portraits of his mother, Marie Serre (Louve), must for ever remain amongst the masterpieces of French art. Rigaud, although the great successes to which he owed his fame were won without exception in portrait-painting, persisted in pressing the Academy to admit him as an historical painter. This delayed his reception, and it was not until January 1700 that he succeeded in obtaining his desire. He presented as his diploma works a St Andrew (Louve) and the portrait of Desjardins already mentioned, exhibited at the salon of 1704, and filled in turn all the various posts of academic distinction. He died on the 27th of December 1774, having never recovered from the shock of losing his wife in the previous year. He had many pupils, and his numerous works had the good fortune to be reproduced by the greatest of French engravers—Edelinck, Drevet, Wille, Audran and others.

RIGBY, RICHARD (1722-1788), English politician, was the only son of Richard Rigby (d. 1730) of Mistley Hall, Essex, a merchant who made a fortune through his connexion with the South Sea Company. Young Rigby became an associate of Frederick, prince of Wales, and entered parliament in 1745. He is chiefly known to fame through his connexion with John Russell, 4th duke of Bedford, and the “Bloomsbury gang,” his audacity earning for him the title of the “brazen boatswain” of the “crew.” In 1735 he became secretary to Bedford, who was lord lieutenant of Ireland, and in the following year he was given the sinecure office of master of the rolls for Ireland. Following the political fortunes of the duke he became paymaster of Ireland in 1765, and in 1768 he obtained the lucrative position of paymaster-general of the forces. Rigby often spoke in parliament, and in 1769 he shared in the opposition to Wilkes. In 1774 he was obliged to resign his position as paymaster-general, and he was somewhat surprised and embarrassed when he was requested to pay over the large sum of public money which was in his possession. He left a great fortune when he died at Bath on the 8th of April 1788. A rapacious and unscrupulous politician, Wraxall says Rigby “possessed talents for addressing a popular assembly which were sustained by a confidence that nothing could abash.”

RIGG, JAMES HARRISON (1831-1900), English Nonconformist divine, was born at Newcastle-on-Tyne on the 16th of January 1831. His father was a Wesleyan minister and sent his son to the Old Kingswood School, Bristol, and afterwards he became an assistant teacher. In 1845 he entered the Wesleyan ministry, and during the agitation of 1849-52 with the laying aside of the traditional connexion and defence of the policy of Methodism. In 1857 he published Modern Anglican Theology, an acute criticism of the writings of Coleridge, Hare, Maurice, Kingsley and Jowett. The book was timely and well received, and though Kingsley at first commented the criticism he afterwards became a cordial friend of the writer. Rigg had now become a leading figure in his own church, and in 1868 was appointed principal of the Westminster Wesleyan Training College for day-school teachers, a post which he held with growing distinction for 35 years. In 1870 he was elected on the first School Board for London, one of the most remarkable assemblies of modern times, and took an important part in providing the syllabus of religious instruction and framing the religious settlement for teachers.

In 1873 he wrote National Education in its Social Conditions and Aspects. A resolute opponent of secular education, he maintained that the state ought not to compete with the churches, but welcome their aid in the work of national education. He was also strongly against the adoption of a rigid universal code. In 1886 he sat on the Royal Commission of Education, and was brought into close contact with Matthew Arnold, and with Dean Stanley, Bishop Temple and other Anglican prelates, who held him in high esteem. In 1877 he became chairman of the second London district of Methodism, and for fourteen years helped to make the history of his church in the home counties. In 1878 he was elected president of conference—and again in 1892. From 1881 he was ministerial treasurer of the Wesleyan Missionary Society, taking an active part in its work. He resigned his principalship in 1903 and died at Brixton on the 17th of April 1900. Dr Rigg was universally honoured as the Nestor of Wesleyan Methodism, in the development of which he had taken a foremost part for over 60 years. His Connexional Economy is a standard work, and his Living Wesley a most discriminating study of the character and work of its subject. His Oxford High Anglicanism (1853) showed how keenly he followed modern developments in the Church of England. His lifelong principle was that Methodism is “a church friendly to all, but owing allegiance to none.”
constitute the "running rigging," since they are "in constant use, to trim yards, and make or shorten sail" (Admiral Smyth, _op. cit._). The rigging must also provide the crew with the means of going aloft, and with standing ground to do their work when aloft. Therefore the shrouds (see below) are utilized to form ladders of rope, of which the steps are called ratlines, by which the crew can mount. Near the heads of the lower masts are the tops—platforms on which men can stand—and in the same place on the topmasts are the "cross-trees," of which the main function is to extend the topgallant shrouds. The yards are provided with ropes, extending from the middle to the extremities or arms, called horses, or footropes, which hang about 2 or 3 ft. down, and on which men can stand. The material of which the cordage is made has differed, and still differs greatly. Leather has been used. must be adapted to resist two kinds of pressure, the longitudinal, whether applied by the wind or by the motion of the vessel when pitching (i.e. plunging head and stern alternately into the hollow of the sea), and the lateral, when the wind is blowing on the side and she is rolling. The longitudinal pressure is counteracted by the bobstays, stays and backstays. A reference to fig. 1 will show that the bobstays hold down the bowsprit, which is liable to be lifted by the tug of the jibs, and of the stays connecting it with the fore-topmast. If the bowsprit is lifted the fore-topmast loses part of its support. In the case of a small vessel, the lifting of a bowsprit would wreck her whole system of rigging in an instant. If fig. 1 is followed from the bow to the mizzenmast, it will be seen that a succession of stays connect the masts with the hull of the ship or with one another. All pull together to resist pressure from

During historic times, however, the prevailing materials have been hemp or esparto grass (Machrocloa, or _Stipa tenacissima_), and in recent days chain and wire. As the whole of the rigging is divided into standing and running, so a rope forming part of the rigging is divided into the "standing part" and the "fall." The standing part is that which is made fast to the mast, deck or block. The fall is the loose end or part on which the crew haul. The block is the pulley through which the rope runs. "Standing" in sea language means "fixed"—thus the standing part of a hook is that which "is attached to block, chain or anything which is to heave the hook up, with a weight hanging to it; the part opposite the point." (Smyth, _sub voce_.) "Tackle" is the combination of ropes and blocks; the combination of cables and anchors constitutes the "ground tackle."

The function of all cordage may be said to be to pull, for the purpose either of keeping the masts in their places, or of moving spars and sails. The standing rigging which supports the masts in front. Pressure from behind is met by the backstays, which connect the topmasts and topgallant masts with the sides of the vessel. Lateral pressure is met by the shrouds and breastbackstays. A temporary or "preventer" backstay is used when great pressure is to be met. Seamen have at all times had recourse to special devices to meet particular dangers. When Duddonald, then captain of the "Pallas" frigate, was chased by a French squadron in stormy weather, he fortified his masts by ordering "all the hawsers" (large ropes a little less strong than the cables which hold the anchor) "in the ship to be got up to the mast heads, and hove taut," _i.e._ made fast to the side. Thus she was able to carry more sail than would have been possible with her normal rigging. The running rigging by which all spars and sails are hoisted, or lowered and spread or taken in, may be divided into those which lift and lower—the lifts, jibs, halliards (halyards)—and those which hold down the lower corners of the sails—the tacks and sheets. A

**Fig. 1.—The Spars and Rigging of a Frigate.** References are not repeated for each mast where the names and functions are identical. 1, bowsprit; 2, bobstays, three pairs; 3, spritsail-gaffs, projecting on each side of the bowsprit—the ropes at the extremities are jib-guys and flying jib-guys; 4, jib-boom; 5, mizzen-mast; 6, back-ropes; 7, flying jib-boom; 8, fore-royal stay, flying jib-stay and halliards; 9, fore-topgallant-stay, jib-stay and halliards; 10, two fore-topmast-stays and fore-topmast-stay halliards; 11, the fore-topbowlines, stopped into the top and two fore-stays; 12, two fore-tacks; 13, fore-truck; 14, fore-royal mast, yard and lift; 15, topgallant mast, yard and lift; 16, fore-top mast, topsail-yard, lift and reef-tackle; 17, foretop, fore-lift, and topsail-sheet; 18, mainmast and fore-shrouds, nine pairs; 19, foresheets; 20, fore-gaff; 21, fore-topmast backstays and topmast tye; 22, royal and topgallant backstays; 23, fore-royal-braces and main-topmast-stay; 24, fore-topgallant braces and main-topgallant-stay; 25, standing parts or fore-topmasts and topmast-stays; 26, haulings parts of fore-topmasts and main-topmasts; 27, fore parts of fore-topmasts and main-topmasts; 28, mainstays; 29, main-tacks; 30, main-truck; 31, main-topmast-braces; 32, mizzen-royal-stay and mizzen-royal-braces; 33, main-topgallant-braces and mizzen-topgallant-braces; 34, standing parts of main-topmasts and mizzen-topmasts; 35, mizzen-topmast-ropes; 36, haulings parts of main-topmasts, mizzen-topbowlines and cross-jack-braces; 37, main-braces and mizzen-stay; 38, standing part of peak halliards; 39, vangs, similar on each gaff; 40, ensign staff; 41, spanker-boom; 42, quarterboat davits; 43, one of the davit topping-lifts and wind-sail; 44, main-yard-tackle; 45, a bull-ropes.
long technical treatise would be required to name the many combinations of cordage and spars which make up the total rigging. All that is attempted here is to give the main lines and general principles or divisions.

The vessel dealt with here is the fully rigged ship of three or more masts. But she includes all the others and the principles are the same. The simplest of all forms of rigging is the dipping lug, a quadrangular sail hanging from a yard, and always hoisted on the side of the mast opposite to that on which the wind is blowing (the lee side). When the boat is to be tacked so as to bring the wind on the other side, the sail is lowered and hoisted again. One rope can serve as halliard to hoist the sail and as a stay when it is made fast on the weather side on which the wind is blowing. The difference between such a craft and the fully rigged ship is that between a simple organism and a very complex one; but it is one of degree, not of kind. The steps in the scale are innumerable. Every sea has its own type. Some in eastern waters are of extreme antiquity, and even in Europe vessels are still to be met with which differ very little if at all from the ships of the Norsemen of the 8th and 9th centuries. For a full account of these varieties of rigging the reader may be referred to Mast and Sail in Europe and Asia (London, 1866), by H. Warington Smyth.

When the finer degrees of variation are neglected the types of rigging may be reduced to comparatively few, which can be classed by the shape of their sails and the number of their masts. At the bottom of the scale is such a craft as the Norse herring boat (fig. 2).

*Fig. 2.—Norse Herring Boat.*

She has one quadrangular sail suspended from a yard which is hung (or slung) by the middle to a single mast which is placed (or stepped) in the middle of the boat. She is the direct representative of the ships of the Norsemen. Her one sail is a "course" such as is still used on the fore and main mast of a fully developed ship; a topsail may be added (as in fig. 3) and then we have the beginning of a fully clothed mast. A very similar craft called a Humber keel is used in the north of England. The lug sail is an advance on the course, since it is better adapted for sailing on the wind, with the wind on the side. When the lug is not meant to be lowered, and hoisted on the lee side, as in the dipping lug mentioned above, it is slung at a third from the end of the yard, and is called a standing lug. A good example of the lug is the Chinese junk (fig. 4). The lug is a "lifting sail," and does not tend to press the vessel down as the fore and aft sail does. Therefore it is much used by fishing vessels in the North Sea. The type of the fore and aft rig is the schooner (fig. 5). The sails on the masts have a gaff above and a boom below. These spars have a prong called "the jaws," which fit to the mast, and are held in place by a "jaw rope" on which are threaded beads called trucks. Sails of this shape are carried by fully rigged ships on the mizenmast, and can be spread on the fore and main. They are then called try sails and are used only in bad weather when little sail can be carried, and are hoisted on the try mast, a small mast attached to the great one. The Lateen (Latin) sail (fig. 6) is a triangular sail akin to the lug, and is the prevailing type of the Mediterranean. These original types, even when unmodified by mixture with any other, permit of large variations. The number of masts of a lugger may vary from one to five, and of a schooner from two to five or even seven. A small lug may be carried above the large one, and a gaff topsail added to the sails of a schooner. A small-masted fore-and-aft-rigged vessel may be a cutter (fig. 7) or sloop. But the pure types may be combined, in topsail schooner, brigantines, barquentines and barques, when the topsail, a quadrangular sail hanging from and fastened to a yard, slung by the middle, is combined with fore and aft sails. The lateen rig has been combined with the square rig to make such a rigging as the xebec—a three-masted vessel square rigged on the main, and lateen on the fore and mizen. Triangular sails of the...
same type as the jibs can be set on the stays between the masts of a fully rigged ship, and are then known as staysails. But it can only be repeated that the variations are innumerable. Studding-sails are pieces added to increase the breadth (spread) of sails, and require the support of special yards, booms and tackle.

The development of the rigging of ships is a very obscure subject. It was the work of centuries, and of practical men who wrote no treatises. It has never been universal. A comparison of the four-masted junk given above with the figures of ships on medieval seals shows at least much similarity. Yet by selecting a few leading types of successive periods it is possible to follow the growth of the fully rigged ship, at least in its main lines, in modern times.

Fig. 8 gives the sail plan of the "Santa Maria," the flagship of Columbus. It is a modern reconstruction, made in 1893 in Spain at the Carraca arsenal, but is based on good authority. She has only the fixed bowsprit, with a yard and a sail hanging from it, the spritsail yard and spritsail. The foremast has one course, the mainmast a course and topsail, the mizen a lateen sail. Fig. 9 is the "Sovereign of the Seas," a British warship of 1637. She still has only the fixed bowsprit, but a small upright mast has been erected at the end, which serves to spread a sprit topsail. In some cases at least a sprit topsail was used. The mizzenmast still carries a lateen sail, but topsails have been added, and the whole rigging has multiplied and developed. Between the "Sovereign of the Seas" and the fully developed ship given in fig. 1 the most apparent differences are in the rigging of the bowsprit and the mizzenmast. The sprit topmast has disappeared, and is replaced.
by the jib-boom. The square spitsail, which could not be trained fore and aft, and was of feeble effect in keeping the ship's head from turning windward, has been replaced by the jib. The spitsail yard (which continued in use till after 1850) has disappeared and has been replaced by the triangular, and the two lower masts have been allowed to drop downwards and help to support the "jib-guys," the lateral supports of the booms. For a time, and after the use of spitsails had been given up, the spitsail yard continued to be used to discharge the funnel and other spars. The square spitsail was of the usual form, with a fore-and-aft sail. The changes in the mizen have an obscure history. About the middle of the 18th century it ceased to be a pure lateen. The yard was retained, but no sail was set on the foresail. Then the yard was given up and replaced by a shorter mast, known as the "foremast." It was, however, comparatively narrow, and when a greater spread of sail was required, a studding-sail (at first called "a driver") was added. At a later date "spansker" and "spansker drivers," which were the working terms, and the studding-sail was called "sail ringtail." The studding-sails, or the representatives of a class of sail once more generally used. In modern times a sail is cut of the extreme size which is capable of being carried in fine weather, and when the wind increases in strength, it is reefed—in one part is gathered (generally) round small cords attached to the sail. Till the 17th century at least the method was often to cut the courses small, so that they could be carried in rough weather. When a greater spread of sail was required, the English mizen yard was lengthened, and a further piece called a "drabber" was added to that. It is an example of the tenacious conservatism of the sea that this practice is still retained by the Swedish small craft called "lodors" in that portion of the Baltic. It must be understood that no innovation was universally accepted at once. Jib and sprit topsail, lateen, mizen and sparsail, and so forth, would be found for long on the sea together.

The history of the development of rigging is one of adjustment. The size of the masts had to be adapted to the ship, and it was necessary to find the due proportion between yards and masts. As the size of the medieval ship increased, the natural course was to increase the height of the mast and of the sail it carried. Even when the mast was subdivided into lower, top and topgallant, the lower mast was too long, and the strain of the sail of the mast. Hence the constant tendency of the ships to leak. Sir Henry Manwaring, when giving the proper proportions of the masts, says that the Flemings (i.e. the Dutch) made them taller ("taller") and "taunt" were (i.e. longer) in order to mean the size them. This is a common English, which again forced them to make the sails more wide. A tall sail could not be cut so wide as a lower one without putting an excessive strain on the mast. He says that the Flemings found an advantage in working to windward, but that they "wronged" (i.e. racked) their ships. The English preferred a less lofty mast and a wider spread of sail.

It was very difficult to say what changes in the proportions of masts and yards took place in English ships between the early 17th and the 19th centuries. The difficulty arises largely not only from insufficient knowledge of the earlier period, but from the fact that a scale was fixed only after trials, and by degrees. Manwaring, for instance, when giving the proportion of the topmasts to lower masts, says: "The topmasts are ever so half long as the masts into which they belong; but there is no absolute proportion in these, and as it is the same with a man to have his short, he may the longer make his topmast long." In some respects the change was certainly slight. In the early 17th century, in England at least, the length of the mainmast was fixed by taking four-fifths of the length of the hull, and in the later the method was to take the length of the lower deck and the extreme breadth, add them together, and divide by two. If we take a 74-gun ship of about the year 1820, which was 176 ft. long on the waterline (i.e. fore and aft), and 80 ft. wide, by the system then used, a mainmast of 112 ft. Manwaring's system would have given her one of 117 ft. But in the proportions of the masts to one another there was a change. In the 17th century the foremast was about equal to the mainmast, but the bowspit, being of the same length as the mainmast. In the 17th the foremast was eight-ninths of the mainmast, while the bowsprit was seven-eighths of the mainmast in the largest ships, and three-fifths in the others. When the bowspit is attached to the mainmast, the mainmast may be made longer, and in the same difficulty increases, for the standard was not the same. The seamen of the 17th century calculated the length of the mainyard not by the size of the mast but by the length of the keel. The mainyard, while the yard was for the others, ought according to the "best and most absolute" estimate to be five-sixths of the length of the keel. But Manwaring again explains that "the proportion was not absolute." If it was followed, the yards of a 17th-century ship must have been rather longer than in a vessel of a hundred and fifty and two hundred years later, when the mainyard was eight-ninths of the mainmast, and a regular scale was fixed throughout. Even so Manwaring's warning that "the proportion was not absolute must be borne in mind. Changes were constant. The system may be referred to "the practice of the English in making alterations, and the development of the rigging has been towards establishing a fair balance between the fore and after spread of canvas. Until the jib was invented in the 18th century, a ship which was sailing on the wind was subject to a disproportionate pressure aft. If she was all given to "gripping," that is to say, inclined to turn head to wind (and all ships are liable to have ways and manners which are mysterious in origin and not seldom incurable), the mizen-sail could not be used, for if it had been she would never have been blowing a gale. Therefore winds could not be made (so far with the wind on the side and somewhat from before her centre) lost the use of part of her sail. The spitsail, which could not be trained fore and aft was not "on the wind."

A few words may be added concerning the tops. In the earlier form of ships the top was a species of crew's nest placed at the head of the mast to hold a look-out, or in military operations to give a place of advantage to archers and slingers. They appear occasionally as mere bags attached to one side of the mast. As a general rule they are round. In the 16th century there were frequently two tops on the fore- and main-masts, one at the head of the lower, another at the head of the topmast, where in later times there only have been the two traverse beams which make the crossbows. The upper top-mast and the middle top-mast are both called "topgallant-masts.

AUTHORITIES.—The present writer is indebted to Admiral Sir Cyprian A. G. Bridge, G.C.B., whose practical acquaintance with the older type of sailing ship as well as with the modern steamship, makes his authority specially valuable, for the correction or confirmation of the technical details in the above article. Among the books which may be made to the following works: Sir Henry Manwaring, The Seaman's Dictionary (London, 1644); Darcy Lever, The Young Sea Officer's Sheet Anchor (London, 1808); Sir George Nares, Steamship (Portsmouth, 1882); Vice- Admiral Edmond Paris, La Musée de marine du Louvre (Paris, 1883).

RIGHT ASCENSION, in astronomy, that co-ordinate of a heavenly body defined by the angle which the meridian passing through it makes with the prime meridian through the vertical equinoct (see Astronomy).

RIGHTS OF MAN AND OF THE CITIZEN, DECLARATION OF, a sort of manifesto issued in 1789 by the Constituent Assembly in the French Revolution, to be inscribed at the head of the constitution when it should be completed. It is a statement of the fundamental principles which inspired the revolution. Historians have traced a connexion with the declarations of rights which preceded the constitution of some of the states of the American Union, especially of Virginia, but the situation in France at the time, and the influence of the writings of the philosophers made the proposal for such a statement very natural. The declaration overturned the political and social principles upon which the existing régime stood. It has served as a base for modern civil legislation and is still a force in European history. The final text voted by the Assembly was accepted by the king on the 5th of October 1789, at first conditionally, then with modifications. It contains a preamble and 17 articles. They proclaim and define political equality and liberty in its various manifestations, determine the character of the law and the conditions of its application, and state at the same time the restrictions upon the individual which are necessary.
RIGORD—RIMBAUD

for the benefit of society. Similar declarations were attached to the constitution of 1793 and to that of the year III.

See E. Blum, La Déclaration des droits de l'homme et du citoyen, text with commentary (Paris, 1902); L. Bourgeois and A. Metin, Déclaration des droits de l'homme et du citoyen, 1789 (Paris, 1901); G. Jellinek, Die Erklärung der Menschen und Bürgerrechte (Leipzig, 1896). This study has been translated into English by Rudolf Tombo (New York), and has aroused considerable controversy: see E. Boutmy, "La Déclaration des droits de l'homme et du citoyen et M. Jellinek," in Annales des sciences politiques for the 15th of July 1902; also E. Walde, La Déclaration des droits de l'homme et du citoyen et l'assemblé constituent, Travaux préparatoires (Paris, 1903).

RIGORD (c. 1150-c. 1209), French chronicler, was probably born near Alais in Languedoc, and became a physician. Afterwards becoming a monk he entered the monastery of Argentueil, and then that of St Denis, and described himself as regis Francorum chronographus. Rigor wrote the Gestd Philippî Augusti, dealing with the life of the French king, William the Breton (g.e.). The earlier part of the Gestd speaks of the king in very laudatory terms, but in the latter part it is much less filled with gold. It was first published in 1466, in the press of Dom Bouquet's Recueil des historiens des Gaules et de la France (Paris, 1738-1876); and with introduction by H. F. Delaborde (Paris, 1882-85). A French translation of the Gestd is in tome xi. of Guizot's Collection des mémoires relatifs à l'histoire de France (Paris, 1825). Rigord also wrote a short chronicle of the kings of France.

See A. Potthast, Bibliotheca historica (Berlin, 1896); and A. Moliner, Les Sources de l'histoire de France, tome iii. (Paris, 1903).

RIGORISM (Lat. rigor, stiffness, firmness), a philosophical term applied by Kant specially to those moralists who take up an anti-hedonist or ascetic standpoint. In general the term is restricted to "littitudinarianism" or "indiscriminism,"—respectively a morality of compromise and a morality of pure indifference,—and signifies insistence upon the strictest interpretation of a principle, rule or criterion. Thus, in Roman Catholic theology, a rigorist holds that in cases of conscience the proper course is to adhere to the strict wording of the law in question.

RIMBAUD, JEAN ARTHUR (1854-1891), French poet and adventurer, was born at Charleville, in the Ardennes, on the 20th of October 1854. He was the second son of a captain in the French army, who in 1860 abandoned his wife and family. From early childhood Arthur Rimbaud, who was severely brought up by his mother, displayed rich intellectual gifts and a sullen, violent temperament. He began to write when he was ten, and some of the poems which now appear in his works belong to his fifteenth year. Before he was sixteen, in consequence of a violent quarrel with his mother, the boy escaped from Charleville with a packet of his verse, was arrested as a vagabond, and for a fortnight was locked up in the Mazas prison, Paris. A few days after being taken home Rimbaud escaped again, into Belgium, where he lived for some time as a tramp, almost starved, but writing verses with feverish exactitude. In February 1871 he left his mother for a third time, and made his way to Paris, where he knew no one, and whence, after very nearly dying of hunger and exposure, he begged his way back to Charleville. There he wrote in the same year the extraordinary poem of Le Bateau ivre, which is now hailed as the pioneer of the entire "symbolist" or "decadent" movement in French literature in all its forms. He sent it to Verlaine, who encouraged the boy of seventeen (whom he supposed to be a man of thirty) to come again to Paris. Rimbaud spent from October 1871 to July 1872 in the capital, partly with Verlaine, partly as the guest of Théodore de Banville, and served in the army of the Commune. With Verlaine he travelled for thirteen months, after the fall of the Commune, through England and Belgium, where in 1873 he published the only work which he ever printed, Une Saison en Enfer, in prose; in that he gives an allocutionary account of his extravagant relations with Verlaine, which, however, were brought to an end by a double attempt of the latter to murder his young companion, and on a second occasion Rimbaud was dangerously wounded by Verlaine's revolver, and the elder poet was imprisoned at Mons for two years. Meanwhile Rimbaud, deeply disillusioned, determined to abandon Europe and literature, and he ceased at the age of nineteen to write poetry. He settled for a while at Stuttgart, studying German, and in 1875 he disappeared. He set out on foot for Italy, and after extraordinary adventures found employment as a day-labourer in the docks at Leghorn. Returning to Paris, he obtained a little money from his mother, and then definitely vanished. For sixteen years nothing whatever was heard of him, but it is now known that he embarked as a Dutch soldier for the Sunda Isles, and, presently deserting, fled to Sumatra and then to Java, where he lived for some time in the forest. Returning to Europe, after a vagabond life in every capital, he obtained in 1888 some minor employment in the quarries of Cyprus, and then worked his way up to a footing into Abyssinia, where he was one of the pioneers of European commercial adventure. Here he settled, at Harrar, as a trader in coffee and perfumes, to which he afterwards added gold and ivory; for the next eleven years, during which he led many commercial expeditions into unknown parts of northern Africa, Shoa and Harrar were his headquarters, and he lived almost entirely with the natives, and as one of themselves. From 1888 to 1891, having prospered greatly as a merchant, he became a sort of semi-independent chieftain, intriguing for France, just
RIME ROYAL—RIMINI

outside the borders of civilization. From documents which were first produced in 1592 it appears that from 1885 to 1889 Rimbaud was in close relations with the Ras Makonnen and with Menelek, then only king of Shoa. At the death of the Negus John, in 1888, he was concerned in the formation of the empire of Ethiopia. From this time Rimbaud had a palace in the town of Harrar, and intrigued with the French government in favour of Menelek and against Italy. Meanwhile, in 1886, believing Rimbaud to be dead, Verlaine had published his poems, under the title of Les Illuminations, and they had created a great sensation in Paris. In this collection appeared the sonnet on the vowels, attributing a different colour to each: "A noir, E blanc, I rouge, U vert, O bleu voyelles." But the author, in his Abyssinian hut of palm-leaves, was, and remained, quite unconscious of the fact. In March 1891 a tumour in his knee obliged Rimbaud to leave Harrar and go to Europe for surgical advice. He reached Marseilles, but the case was hopeless; the leg had to be amputated, and Rimbaud died there in hospital on the 20th of November 1891. The poems of Rimbaud all belong to his earliest youth. Their violent originality, the influence which they have exercised upon younger writers, the tumultuous existence of their author, and the strange veil of mystery which still hangs over his character and dreams, have given Rimbaud a remarkable fascination. His life had been written by M. Patrice Berrichon (1897), and valuable reminiscences by his sister, Mlle Isabella Rimbaud. His Oeuvres were collected in 1898 by M.M. Berrichon and Delahaye, and in 1901 his statue was unveiled at Charleville.

RIME ROYAL, the name given to a strophe or stanza-form, which is of Italian extraction, but is almost exclusively identified with English poetry from the fourteenth to the early seventeenth centuries. It appears to have been formed out of the stanza called Ottava rima (q.v.), by the omission of the fifth line, which reduces it to seven lines of three rhymes, arranged ababc.

The "Prioress' Tale," in the Canterbury Tales, offers another particularly beautiful proof of Chaucer's skill in the use of the rime royal. In the fifteenth century this stanza was habitually used, in preference to heroic verse, by Hoccleve and Lydgate, and, with more melody and grace, by the unknown writer of The Flower and the Leaf. In the sixteenth century, rime royal was chosen by Hayes as the vehicle of his Pastime of Pleasure (1566) and by Barclay in his Ship of Fools (1596); it was now regarded as the almost exclusive classical form for heroic poetry in England, and it had long been so accepted in Scotland, where The King's Quaire of King James I., the Fables of Hennyson and The Thistle and the Rose of Dunbar had closely followed Chaucer's pattern. The greater part of that huge poetic miscellany, The Mirror for Magistrates (1559-1610), was written in rime royal, Sackville's moments Induction among the rest. The seven-line stanza began to go out of fashion with the revival of Elizabethan poetry, but we find it still used in Spenser's Hymn of Heavenly Beauty, Shakespeare's Lucrece and the Orchestra of Sir John Davys. After the first decade of the seventeenth century rime royal went out of fashion. Since then it has been occasionally revived, but not in poems of great length or particular importance. Rime royal should always be written in iambic metre, and be formed of seven lines of equal length, each containing ten syllables.

RIMINI, a town and bishop's see of Italy, in the province of Forli, Emilia, on the Adriatic coast, 66 m. S.E. of Bologna by rail. Pop. (1901) town, 18,022; commune, 45,801. The city is bounded on three sides by water. It faces the Adriatic to the north, has the torrent Aprusa, now called Ausa, on the east, and the river Marecchia on the west. It stands in a fertile plain, which on the southern side soon swells into pleasant slopes backed by the jagged peaks of the Umbrian Apennines. The foremost foothill of the range is the steep crag of Mons Titanus, crowned by the towers of the republic of San Marino. Rimini attracts numerous visitors for the sea-bathing at Porta Marina. It has mineral springs, and the industries comprise fisheries, ironworks and foundries, sulphur furnaces, silk-mills, rope walks, match factories, brickworks, flourmills and furniture. Its main interest, however, is historical. Apart from the ancient buildings, &c., referred to below, Rimini can boast of a good public library, founded by the jurist Gambalunza in 1617, a municipal picture gallery, an archaeological museum, a technical school (1882) and a bronze statue of Pope Paul V. The ancient castle of Sigismondo Malatesta, now dilapidated, has in recent years been used as a prison.

History. Rimini is the ancient Ariminum (q.v.), in the early 5th century, and Rimini, with its former title, the middle ages the history of Rimini has no importance. Alternately captured by Byzantines and Goths, it was rigorously besieged by the latter in A.D. 538. They were, however, compelled to retreat before the reinforcements sent by Belisarius and Narses; thus the Byzantines, after various vicissitudes, became masters of the town, appointed a duke as its governor, and included it in the exarchate of Ravenna. It afterwards fell into the power of the Longobards, and then of the Franks, who yielded it to the pope, for whom it was governed by counts to the end of the 10th century. Soon after this period the imperial power became dominant in Rimini. In 1157 Frederick I. gave it, by imperial patent, the privilege of coining money and the right of self-government; and in the 13th century we find Rimini an independent commune waging war on the neighbouring cities.

In the year 1216, Rimini, being worsted by Cesena, adopted the desperate plan of granting citizenship to 700 members of the powerful Malatesta tribe, Giovanni and Malatesta, for the sake of their strength in the defence of the state and the conduct of the war. This family quickly struck root in the town and gave birth to future tyrants: for in 1237 Giovanni was named podestà, and this office was the first step towards the sovereign power afterwards assumed by his descendants. Meanwhile, Rimini was torn by the feuds of Guelf and Ghibelline. The latter were the dominant party in the days of Frederick II., although very unpopular on account of the grievous taxes imposed by the empire. Accordingly, the majority of the urban nobles joined the Guelfs and were driven into exile. But before long, as the Swabian power declined in Italy, the Guelf party was again predominant.

Then followed a long period of confusion, in which, by means of conspiracies and crimes of every kind, the Malatesta succeeded in becoming masters and tyrants of Rimini. Giovanni Malatesta had died in 1247 and been succeeded by his son Malatesta, born in 1212, and surnamed Malatesta da Verrucchio. This chieftain, who lived to be a hundred years old, had ample time to exercise his unusual designs, and was the real founder of his house. Seizing the first suitable moment, he placed himself at the head of the exiled Guelfs, and restored them to Rimini. Then, as the empire acquired fresh strength in Italy, he quietly bided his time and, on the descent of the Angevins, again assumed the leadership of the Guelfs who now had the upper hand for a long time. Being repeatedly elected podestà for lengthy terms of office, he at last became the virtual master of Rimini. Nor was he checked by Rome. Pope Boniface VIII. was fully aware of the rights and traditional pretensions of the Holy See, but preferred to keep on good terms with one who had so largely contributed to the triumph of the Guelfs in Romagna. Accordingly he not only left Malatesta unmolested, but in 1299 conferred on him fresh honours and estates, so that
his power went on increasing to the day of his death in 1372.

Four sons had been born to Malatesta—Malatestino, Giovanni the Lame, Paolo the Handsome, and Pandolfo; but only the oldest and youngest survived him. Giovanni the Lame (Sciancato), a man of a daring impetuosity only equaled by his ugliness, had proved so useful a general to Giovanni da Polenta of Ravenna as to win in reward the hand of that potentate's beautiful daughter, known to history as Francesca da Rimini. But her heart had been won by the handsome Paolo, her brother-in-law; and the two lovers, being surprised by Giovanni, were murdered by him on the spot (1285). This episode of the story of the Malatesta has been immortalized in Dante's *Inferno*. Giovanni died in 1304. Thus in 1312 Malatestino became lord of Rimini, and on his decease in 1317 bequeathed the power to his brother Pandolfo.

Pandolfo died in 1326, leaving two heirs, Malatesta and Galeotto. The former was nicknamed Guastafamiglia, because, although at first willing to let his brother share his power, he rid himself by violence and treachery of other kinsmen who claimed their just rights to a portion of the state. His intent was to become sole lord and to aggrandize his tiny principality. But the reigning pope, Innocent VI., despatched the terrible Cardinal Alboreto to Romagna, and it was speedily reduced by fire and sword. In 1335 the Malatesta shared the fate of the other potentates of the land. Nevertheless, it was the cardinal's policy to let existing governments stand, provided they promised to act in subordination to the papal see. Thus he granted the Malatesta brothers the investiture of Rimini, Pesaro, Fano and Fossombrone, and they arranged a division of the state. Guastafamiglia took Pesaro, which was held by his descendants down to the brothers Carlo and Galeazzo. The former of these, who died in 1349, was father to the Farisina beheaded in Ferrara, whose tragic love story has been sung by Byron. The latter won the title of "P'Inetto" (the Incapable) by the foolish sale of his rights over Pesaro to the Sforza in 1447.

Galeotto, on the other hand, retained the lordship of Rimini, ruling tranquilly and on good terms with the popes, who allowed him to add Cervia, Cesena and Bertinoro to his states. Dying in 1385 at the age of eighty, he left two sons—Carlo, who became lord of Rimini, and Pandolfo, who had Fano for his share. Carlo (1364-1420) was energetic, valiant and a friend of the popes, who named him vicar of the church in Rimogna. He was a patron of letters and the arts, and during his reign his court began to be renowned for its splendour. As he left no issue, his inheritance was added to that of his brother Pandolfo, and Fano was once more united to Rimini. Pandolfo (1370-1427) had led the life of a condottiere, taking a prominent part in the Lombard wars following on the death of Galeazzo Maria Visconti, and held rule for some time in Brescia and Bergamo. He left three sons, two of whom—Pandolfo and Carlo—were declared legitimate by Pope Martin V. The eldest, Galeotto (1417-1432), was an ascetic, gave little or no attention to public business, and, dying early, bequeathed the state to his brother Sigmundo Pandolfo. The third son, Novello Malatesta (1418-1465), ruled over Cesena.

Sigmundo (1417-1468) is the personage to whom Rimini owes its renown during the Renaissance, of which indeed he was one of the strangest and most original representatives. He was born in Brescia, and when called to the succession, at the age of fifteen, had already given proofs of valour in the field. His knowledge of antiquity was so profound as to excite the admiration of all the learned men with whom he discoursed, even when, as in the case of Pius II., they chanced to be his personal enemies. To him is due the erection of the church of St. Francis, or temple of the Malatesta, one of the rarest gems of the Renaissance and the greatest of Malvesti's treasures (see below for description).

Of so dissolute a life that, although married, he had children by several mistresses at the same time, he gave vent to all his passions with a ferocity that was bestial rather than human. And—as the crowning contradiction of his strange nature—from his youth to the day of his death he remained the devoted lover of the woman for whose sake he became a poet, whom he finally made his wife, and whom he exalted in every way, even to the point of rendering her almost divine honours. Yet this love never availed to check his excesses. On assuming power in 1432, Sigmundo was already affianced to the daughter of Count Cittadella; but when that famous leader was arraigned as a traitor by the Venetians, and ignominiously put to death, he promptly withdrew from his engagement, under the pretext that it was impossible to marry the child of a criminal. In fact, he aimed at a higher alliance, for he espoused Ginevra d'Este, daughter of the duke of Ferrara, and his entry into Rimini with his bride in 1434 was celebrated by splendid festivities. In 1437 a son was born to him, but died within the year, and in 1440 the young mother followed it to the grave. Every one declared that she died by poison administered by her husband. This, however, was never proved. The duke of Ferrara remained his friend, nor is it known what motives Sigmundo could have had for wishing to get rid of his wife. Two years afterwards he married Polissena, daughter of the famous condottiere Francesco Sforza, who in 1443 bore him a son named Galeotto Roberto. But by this time he was already madly in love with Isotta degli Atti, and this was the passion that endured to his death. The lady succeeded in gaining an absolute ascendency over him, which increased with time. She bore him several children, but this did not prevent his having others by different concubines. Such being the nature of the man, it is not astonishing that, as his arour for Isotta increased, he should have little scruple in risking himself of his second wife. On the first June 1450 Polissena died by strangling, and on the 30th of the same month Isotta's offspring were legitimized by Nicholas V.

It is only just to record that, although Malatesta's intrigue with Isotta had long been notorious to all, and he had never sought to conceal it, no one ever accused her of either direct or indirect complicity in her lover's crimes. Isotta's history, however, is a strange one, and opens up many curious questions. She was of noble birth and seems to have attracted Sigmundo's notice as early as 1438, for at the age of twenty he produced verses of some merit in praise of her charms. She was indeed widely celebrated for her beauty and intellect, culture, firmness and prudence; and even Pope Pius II. proclaimed her worthy to be greatly loved. When Sigmundo was absent she governed Rimini wisely and well, and proved herself a match for the statesmen with whom she had to deal. The leading poets of the court dedicated to her a collection of verses entitled *Isottaei*, styled her their mistress and the chosen of Apollo. Artists of renown perpetuated her features on canvas, on marble and on many exquisite medals, one of which has a closet book graven on the reverse, with the inscription "Elegiae" in allusion to the verses of the Malatesta poetess. In his book on the Malatesta and Rimini, asserted that there was documentary evidence to prove that Isotta was unable to sign her own name. But it is not at all surprising that Isotta should have her letters written and signed by another hand, when such was by no means an uncommon practice among the princes and nobilities of her day. Lucrezia Borgia, for instance, frequently did the same. It is besides simply incredible that a woman of the Italian Renaissance of Isotta's birth, standing and reputation should have been unable to write. Her marriage with Malatesta did not take place until 1456; but of the ardent affection that had long bound them together there are stronger proofs than the lover's juvenile verses, or than even the children Isotta had borne to him. For, more than all else, the temple of St. Francis has served to transmit to posterity the history of their loves. Malatesta decided on building this remarkable church as a thanksgiving for his safety during a dangerous campaign undertaken for Pope Eugenius IV. about the year 1445. The first stone was laid in 1446, and the work was carried on
with so much alacrity that mass was performed in it by the close of 1450. Sigismondo entrusted the execution of his plans to Leo Battista Alberti, who had to encase in a shell of classic architecture a 13th-century Franciscan church. The original edifice being left intact, it was a difficult question how to deal with the windows and the Gothic arches of the interior. Alberti solved the problem with marvellous skill, blending the old architecture with the new style of the Renaissance, and giving it variety without destroying its unity of effect.

Being eager to adorn his temple with the most precious marbles, Sigismondo’s veneration for antiquity did not prevent him from pillaging many valuable classical remains in Rimini, Ravenna and even in Greece. Such was the zeal with which Alberti pursued his task that the exterior of the little Rimini church is one of the finest and purest achievements of the Renaissance, and surpasses in beauty and elegance all the rest of his works. But it is much to be deplored that he should have left the upper part of the façade unfinished. Alberti came to Rimini, made his design, saw the work begun and then left it to be carried out by very skilful artists, on whom he imparted the necessity of working at preserving its general character so as “not to spoil that music.”

The internal decorations, too, were executed by different sculptors under the personal direction of Malatesta, who, even when engaged in war, sent continual instructions about their work. It is difficult to give an exact idea of this extraordinary church to those who have no personal acquaintance with it. The vault was never finished, and still shows its rough beams and rafters. The eight side chapels alone are complete, and their pointed arches spring from Renaissance pilasters planted on black marble elephants, the Malatesta emblems, or on baskets of fruit held by children. The surface of the pilasters is divided into compartments encrusted with bas-reliefs of various subjects and styles. Everywhere—one balustrade closing the chapels, round the base of the pilasters, along the walls, beneath the cornice of both the exterior and the interior of the church—there is one ornament that is perpetually repeated, the interwoven initials of Sigismondo and Isotta. This monogram is alternated with the portrait and arms of Malatesta; and these designs are enwreathed by festoons linked together by the tyrant’s second emblem, the rose. The most singular and characteristic feature of this edifice is the almost total absence of every sacred emblem. Rather than to St Francis and the God of the Christians it was dedicated—and that while Sigismondo’s second wife still lived—to the glorification of an unhallowed attachment. Nature, science and antiquity were summoned to celebrate the tyrant’s love for Isotta. The bas-reliefs of one of the chapels represent Jupiter, Venus, Saturn, Mars and Diana, together with the signs of the zodiac. And these subjects are derived, it appears, from a poem in which Sigismondo had invoked the gods and the signs of the zodiac to soften Isotta’s heart and win her to his arms. The pageants of Mars and Diana seem to have been suggested by the Trionfi of Petrarch. Elsewhere we see prophets and sibyls, personifications of the theological virtues and of the sciences. The delicate bas-reliefs of botany and medicine, history and astronomy, have been judged by some writers to be Grecian, on account of the ancient appearance of their marble, their inscriptions in Greek and Latin, and others that have never been deciphered. But a moment’s examination of the sculptures is enough to destroy this hypothesis. Besides, some of the inscriptions are very easily read and record “Apollo Arimineus” and “Jupiter Ariminaeus.”

In the first chapel on the left is the family tomb of the Malatesta, with sculptured records of their triumphs and of their alleged descent from Scipio Africanus. Better worthy of notice is the third chapel to the right, known as that of the Angels, on account of the angels and children carved on its pillars. It is nominally dedicated to the archangel Michael, whose statue is enshrined in it; but the figure has the face of Isotta, the ruling deity of this portion of the church. For here is the splendid and fantastic tomb erected to this lady, during her life and previous to the death of Sigismondo’s second wife. No monument, be it remarked, is raised over the burial-place of Ginevra and Polissena. The urn of Isotta’s sarcophagus is supported by two elephants, and bears the inscription, “D. Isottae Ariminenis B. M. Sacrum, MCCCL.” The “D.” has been generally interpreted as “Divae” and the “B. M.” as “Beatæ Memoriae.” But some, unwilling to credit such profanity, allege that the letters stand for “Boneae Memoriae.” Nevertheless, all who have seen the church must admit the improbability of similar scruples.

The numerous artists employed on the interior of the church were under the direction of the proto-maestro Matteo de Pasti the celebrated medallist. And indeed the peculiar and fantastic character of the sculptures in this chapel frequently recalls the designs of his famous works. All this decoration is in strange contrast with the grandly austere simplicity of the façade and outer walls of the church. There no ornament disturbs the harmony of the lines. The frieze beneath the cornice, represented by the letters’ initials and the Malatestan ensigns, is in such very low relief that it only embalms the idea of “that music” produced by the marvellous skill of Alberti. Also the colour of the stone, a soft creamy white, adds to the general beauty of effect. And everything both within and without contributes to the profane and pagan character which it was Sigismondo’s purpose to impress on the Christian church. On each of its outer walls are seven arched recesses, intended to contain the ashes of the first literati and scientists of his court. In the first, to the right, is the urn of the poet Basino, one of his pensioners, in the second that of Giusto de’ Conti, author of some rhymes on the Bella Mano, while the third bore the more famous name of Gemisthus Plotho. This well-known Byzantine philosopher was the diffuser of Platonism in Florence during the time of Cosimo de’ Medici, and had faith in the revival of paganism. Returning to his own people, he had died in the Morea. Sigismondo, having gone there in command of the Venetian expedition against the Turks, exhorted the philosopher’s bones as holy relics, and brought them to Rimini for worthy sepulture in his Christian pantheon. All this is solemnly recorded in the inscription, which is dated 1465.

The fourth sarcophagus was that of Roberto Valturio (d. 1489), the engineer, author of De Re Militari, who had been Sigismondo’s minister and had aided him in the construction of the castle of Rimini. The other urns on this side were placed by Malatesta’s successors, and the arches on the left wall remained unembellished.

Sigismondo understood the science of fortification. He was also the first to discard the use of wooden bomb-shells, and substitute others cast in bronze. As a soldier his numerous campaigns had shown him to be possessed of all the best qualities and worst defects of the free captains of his time. He began his military career in 1432 in the service of Eugenius IV.; but, when this pope doubted his good faith and transferred the command to another, he sided with the Venetians against him, though at a later date he again served under him. On the decease of Filippo Maria Visconti in 1447 he joined the Aragonese against Venice and Florence; but, presently changing his flag, fought valiantly against Alphonso of Aragon and forced him to raise the siege of Piombino. In 1454 he accepted a command from the Sienese; but suddenly, after his usual fashion, he made peace with the enemies of the republic, and had to save himself by flight from arrest for his perfidy. It was then that the letters from Isotta were confiscated. After this he began scheming to hasten the coming of the Angevins, and took part in new and more hazardous campaigns against adversaries such as the duke of Urbino, Sforza of Milan, Piccinino, and, worst of all, the Sienese pope, Pius II., his declared and mortal foe. This time Sigismondo had blundered; for the cause of Anjou was hopelessly ruined in Italy. He was therefore driven to make his submission to the pope, but, again rebelling, was summoned to trial in Rome (1460) before a tribunal of hostile cardinals. All the old charges against him were now revived.
and eagerly confirmed. He was pronounced guilty of rape, incendiaryism, incest, assassination and heresy. Consequently he was sentenced to the deprivation of his state (which was probably the main object of the trial), and to be burnt alive as a heretic.

This sentence, however, could not easily be executed, and Sigismondo was only burnt in effigy. But the pope marked the intensity of his hatred by causing the dummy to be carved and dressed with such lifelike resemblance that he was almost able to persuade himself that his hated enemy was really consumed in the flames. Malatesta could afford to laugh at this farce, but he nevertheless prepared in haste for a desperate defence (1462). He knew that the bishop Vitelleschi, together with the duke of Urbino and his own brother Novello Malatesta, lord of Cesena, were advancing against him in force; and, being defeated by them at Pian di Marotta, he was driven to Rome in 1463 to again make submission to the pope. This time he was stripped of all his possessions excepting the city of Rimini and a neighbouring castle, but the sentence of excommunication was withdrawn. The once mighty tyrant of Rimini found himself reduced to penury with a state chiefly composed of a single town. He therefore took service with the Venetians, and in 1464 had the command of an expedition to the Morea. Here his movements were so hampered by the interference of the commissioners of the republic that, with all his valour, he could achieve no decisive success. In 1466 he was able to return to Rimini, for Pius II. was dead, and the new pope, Paul II., was less hostile to him. Indeed, the latter offered to give him Spoleto and Foligno, taking Rimini in exchange; but Malatesta was so enraged by the proposal that he went to Rome with a dagger concealed on his person, on purpose to kill the pope. But, being forewarned, Paul received him with great ceremony, and surrounded by cardinals prepared for defence; whereupon Sigismondo changed his mind, fell on his knees and implored forgiveness. His star had now set for ever. For sheer subreptitiousness he was given the surname of Popolo and was not a prey to petty rebellions with a handful of men. At last, his health failing, he returned to his family, and died in Rimini on the 7th of October 1468, aged fifty-one years.

He was succeeded, according to his desire, by Isotta and his son Sallustio. But there was an illegitimate elder son by another mother, named Roberto Malatesta, a valiant and unscrupulous soldier. Befriended by the pope, this man undertook to conquer Rimini for the Holy See, but came there to further his own ends instead (20th October 1469), and, while feigning a desire to share the government with Isotta and her son, resolved, sooner or later, to seize it for himself. This aroused the pope's wrath, and Roberto instantly prepared for defence. Finding an ally in the duke of Urbino, whose eyes were now opened to the aggressive policy of the church, he was able to repulse its forces. Paul II. died soon after, and was succeeded by Sixtus IV. Roberto's position was now more secure, and he offered strength to the recent alliance he had made himself to the daughter of the duke of Urbino. The next step was to dispose of his rival kindred. On the 8th of August 1470 Isotta's son was found murdered in a well belonging to the Marcheselli family; and a bloodstained sword, placed in their courtyard by Roberto, made it appear as though they had been guilty of the crime. Towards the end of the same year Isotta died also, apparently of a slow fever, but really, it was believed, by poison. Another of her sons, Valerio, born in 1433, still lived, but he was openly put to death by Roberto on a trumped-up charge of treason. In 1475 the new tyrant celebrated his nuptials with the duke of Urbino's daughter, and, being again taken into favour by the pope, valiantly defended him in Rome against the attacks of the duke of Calabria, and died there in 1482 of the hardships endured in the war. His widow was left regent during the minority of his son Pandolfo, who was nicknamed Pandolfozzo on account of his evil nature. Directly he was of age, he seized the reins of government by killing some relations who had plotted against him, and crushed another conspiracy in the same way. A daring soldier, he distinguished himself at the battle of the Tarbo against the French; but his tyranny made him hated by his subjects. In 1478 when Cesare Borgia fell in Romagna with violence and fraud, this Malatesta shared the fate of other petty tyrants and had to fly for his life. After the fall of the Borgia he returned, but, being bitterly detested by his people, decided to sell his rights to the Venetians, who had long desired to possess Rimini, and who gave him in exchange the town of Cittadella, some ready money, and a pension for life.

This arrangement was naturally disapproved by Rome, and especially by Julius II.; he therefore contrived the league of Cambray on purpose to ruin the Venetians, who were crushingly defeated in 1509. Thereupon the pope, having accomplished his own ends, made alliance with the Venetians, who were now prostrate at his feet, and, with them, the Spaniards and the Swiss, fought against the French at Ravenna in 1512. Here the French were victors, but owing to their heavy losses and the death of their renowned leader, Gaston de Foix, were compelled to retreat. Thus Julius became master of Rimini and the other coveted lands. Malatesta made more than one attempt to win back his city, but always in vain, for his subjects preferred the papal rule, and in 1528 Pope Clement VII. became definite master of the town. Thus, after two hundred and fifty years, the sway of the Malatesta came to an end, and Pandolfo was reduced to beggary. He died in 1534, leaving a daughter and two sons in great poverty. The elder, Sigismondo, after various military adventures, died at Reggio d'Emilia in 1543; and Malatesta, the younger, went to fight in the Scotch and English wars, and was never heard of again.

Sigismondo had left male heirs who made another attempt to regain Rimini in 1555, but Pope Paul IV. declared them deposed in perpetuity in punishment of Pandolfozzo's misdeeds. From that time the Malatesta became citizens of Venice; their names were inscribed in the Golden Book, and they were admitted to the grand council. With the death of Christina Malatesta, the wife of Niccolo Boldo, the Rimini branch of the family became extinct. The descendants of Giovanni, brother of Malatesta da Verrucchio, who married one of the Sogliano, were known as the Sogliano-Malatesta. The representatives of this branch settled in Rome.

The history of Rimini practically ends with its independence. It fell into obscurity under the rule of the popes, and was not again mentioned in history until, in 1831 and 1845, it began taking a prominent part in the revolutionary movements against papal despotism and in favour of Italian independence.

RIMMER, WILLIAM (1816-1879), an American artist, was born in Liverpool, England, on the 20th of February 1816. He was the son of a French refugee, who emigrated to Nova Scotia, where he was joined by his wife and child in 1818, and who in 1836 removed to Boston, where he earned a living as a shoe-maker. The son learned the father's trade; at fifteen became a draughtsman and sign-painter; then worked for a lithographer; opened a studio and painted some ecclesiastical pictures; in 1840 made a tour of New England painting portraits; lived in Randolph, Mass., in 1845-55 as a shoe-maker, for the last years of the decade practising medicine; practised in East Chelsea and received a diploma from the Suffolk County Medical Society; and in 1855 removed to East Milton, where he supplemented his income by carving busts from blocks of granite. In 1866 he made his home of St Stephen's, now in the Boston Athenaeum; and in 1867 his "Falling Gladiator" (since 1880 in the Boston Museum of Fine Arts), which Truman H. Bartlett calls "the most remarkable
work of sculpture that has yet [1882] been produced in this country... powerful, wonderful, but not alluring." Rimmer's sculptures, except those mentioned and "The Fighting Lions" (now in the Boston Art Club), "A Dying Centaur" (in the Boston Museum of Fine Arts), and a statue of Alexander Hamilton (made in 1865 for the city of Boston), were soon destroyed. He worked in clay, not modelling but building up and chiselling; almost always without models or preliminary sketches; and always under technical disadvantages and in great haste; but his sculpture is anatomically remarkable and has an "early-Greek" simplicity and strength. He published Elements of Design (1864) and Art Anatomy (1877), but his great work was in the class-room, where his lectures were illustrated with blackboard sketches. His studies in line suggest William Blake in their imaginative power. He died on the 20th of August 1879.

RIMSKY-KORSAKOV, NICOLAS ANDREEVICH (1844-1908), Russian composer, was born at Tihkvin, Novgorod, on the 18th (N.S.) of March 1844. He was one of the musical amateurs who, with Borodin, Cui, Moussorgsky, gathered round Balakirev in St. Petersburg in the days when Wagner was still a student. By 1865 he had written a symphony (in G minor) which in that year was performed—the first by a Russian composer—under Balakirev's direction, and in 1875 he definitely retired from the navy, having been appointed a professor in the St. Petersberg Conservatoire. The same year witnessed his marriage to a talented pianist, Nadejda Pourgold, and the production of his first opera, Psikhitanka. This was followed by May Night (1878), The Snow Maiden (1880), Mloda (1882), Christmas Eve (1894), Sadko (1895), Moussert and Salieri (1896), The Tsar's Bride (1899), Tsar Salatla (1900), Seraphyla (1902), Kostchei the Immortal (1902), Kiite (1903). But his operas attracted less attention abroad than his symphonic compositions, which show a mastery of orchestral effect combined with a fine utilization of Russian folk-melody and a happy feeling for "programme music," his writing being peculiarly individual and distinctive in its restraint and avoidance of violent methods. Notable among these works are his first symphony, his second (Op. 9) Antiar, his third (Op. 32), and his orchestral suites and overtures, his Spanish Capriccio (1887) being particularly appreciated. He also wrote a number of beautiful songs, piano pieces, and several sacred works. As a conductor he was known in England, and in 1892 was appointed conductor of the St. Petersberg Conservatoire, a position which he held until 1908. In 1865 he was appointed director of the Moscow Conservatoire, a position which he held until 1908. He died there on the 20th of June 1908.

RINDERPEST (German for "cattle-plague," which is the English synonym), one of the most infectious and fatal diseases of oxen, sheep, goats, camels, buffaloes, yaks, deer, &c.; a virulent eruptive fever which runs its course so rapidly and attacks such a large percentage of ruminants when it is introduced into a country, that from the earliest times it has excited terror and dismay. It is an Asiatic malady, and has prevailed extensively in south Russia, central Asia, China, Indo-China, Burma, India, Persia, Ceylon and the Malay Archipelago. Thence it has at times been carried into Europe, and towards the end of the 19th century into South Africa. It appeared in Egypt in 1844 and 1855, Abyssinia in 1890, Japan in 1892, and the Philippines in 1898.

It has been noted that its irruptions into Europe in the earlier centuries of our era always coincided with invasions and hostilities, and that in the middle ages the cattle plagues and the period the disease accompanied the events of war, when troops with their commissariat moved from the east towards the west, or cattle, when they were carried in the same direction. One of the earliest recorded irruptions of cattle-plague into western Europe occurred in the 5th century after the sanguinary invasion of the Huns under Attila, the expulsion of the Goths from Hungary, and the fierce internece wars of the whole Germanic population. The disease appears then to have been carried from Hungary through Austria to Dalmatia, while

by Brabant it obtained access to the Low Countries, Picardy, and so on to the other provinces of France. In the curious poem De Mortibus Animarum written by St. Severus, who lived at that period, the course and destructiveness of the disease are specially alluded to. Many invasions of Europe are described, and in several of these Britain was visited by it—as in 809-10, 986-87, 1223-25, 1513-14, and notably in 1713, 1745, 1774, 1799. In 1865 and 1872 it was imported directly from Russia. In 1870-71 it destroyed 70,000 cattle in France, 30,000 in Alsace-Lorraine, and 10,000 in Germany. In England an outbreak occurred in 1877, when it was imported from Germany, where the disease continued until 1879.

The infective agent has not been positively identified, but it is known to exist in all the various secretions and excretions, in the flesh, blood and various organs of the body. Contagion may be direct or indirect, and the disease may be conveyed to healthy cattle by contaminated fodder, litter, water, clothing, pasture, sheds, railway wagons, hides, horns and hoofs. Attendats, cats, dogs, birds, vermin and flies may spread the infection. Definite symptoms of the disease may not be recognized until the expiration of three to six days after exposure, the period of incubation.

Symptoms.—Like some other general diseases, this does not always present exclusively or pathognomonic symptoms, but is rather characterized by a group of functional and anatomical alterations. An exact knowledge of its symptoms and necropsiological appearances is of the utmost importance, as its extension and consequent ravages can only be arrested by its timely recognition and the immediate adoption of the necessary sanitary measures. Intense fever, diarrhoea or dysentery, croupous inflammation of the mucous membranes in general, sometimes a cutaneous popular eruption, and great prostration mark the course of the affection, which is frequently most difficult to diagnose during life, especially if its presence is not suspected. Its introduction and mode of propagation can, in many instances, be ascertained only at a late period, and when great loss may already have been sustained. In the majority of cases the examination of the carcase of an animal which has died or been purposely killed is the best way to arrive at a correct diagnosis. Indeed, this is practically the only certain means of concluding as to the presence of the malady, as there are considerable variations in the chief symptoms with regard to their intensity as well as in the secondary symptoms and phenomena.

As a result, when the disease is known to be in the regions in which this malady may be said to be endemic, the symptoms are often comparatively slight, and the mortality not great. So much is this the case that veterinary surgeons who can readily distinguish the disease when it affects the cattle of western Europe, can only with difficulty diagnose it in animals from Hungary, Bessarabia, Moldavia, or other countries where it is always more or less prevalent. In these the indications of fever are usually of brief duration, and signs of lassitude and debility are, in some instances, the only marks of the presence of this virulent disorder in animals which may, nevertheless, communicate the disease in its most deadly form to the cattle of other countries. Slight diarrhoea may also be present, and a cutaneous eruption, accompanied by gastric disturbance, running at the eyes, and occasional cough. In the more malignant form the fever runs high, 106° to 107° Fahr., and all the characteristic symptoms are well marked: dulness, sunken eyes, eruption on the skin, discharges from eyes, nose and mouth, shivering fits, difficult breathing, dry, harsh cough, miliary eruptions on the gums, abdomen, trunk, and extremities, with certain nervous phenomena, and dysenteric dejections. Death generally occurs in four or five days, the course of the disorder being more rapid with animals kept in sheds than with those living in the open, and in summer than in winter. The post-mortem appearances are most marked in the digestive canal, and comprise red spots and erosions on the palate, lips, tongue and pharynx; intense congestion of the lining of the fourth stomach, which in places is covered with a grey or reddish pultaceous deposit, under which the membrane is deeply
ulcerated. Similar lesions are seen in the small intestines, caecum and rectum. The membrane lining the air passages is congested throughout, and the lungs are emphysematous.

In recent years much has been done in Russia and India towards the prevention of rinderpest by inoculation and the use of immunizing sera. In South Africa the bile method (or the injection of bile obtained from cattle dead of rinderpest), discovered by Koch, in 1896; bile with admixture of glycerine, recommended by Edington; the simultaneous injection of serum and rinderpest blood, introduced by Turner and Kölle in 1897, and repeated injection of fortified serum alone, have been employed, more or less successfully, in conferring immunity. But elsewhere the main line of action has been in the direction of preventing the introduction of the disease by prohibiting the importation of cattle from infected countries.

RING (O.E. hring; a word common to Teutonic languages, and probably cognate with the Lat. circus, Gr. κύκος or κύκος, Skt. chakrā, wheel, circle, cf. also "hariangā"), in art, a band of circular shape of varying sizes, made of any material and used for various purposes, but, particularly, a circular band of gold, silver or other precious or decorative material used as an ornament, not only for the finger, but also for the ear (see EAR-RING), or even for the nose, where it is still worn by certain races in India and Africa. The word is also used of many objects which in structure take the shape of a circle or hoop, such as the tracheal rings, the circular-shaped bands of cartilage in the walls of the windpipe, the "annual rings," or concentric layers of wood produced each year in the trunks of trees, &c. In transferred senses "ring" is also applied to an enclosed space, whether circular, oval or otherwise: hence to the arena of a circus or hippodrome, the enclosure for a boxing contest, or to the place on a racecourse reserved for the bookmakers for the purpose of betting. A particular application in a transferred sense is that to a combination of persons in trade for the purpose of controlling markets, prices, etc.

In the art sense (see also GEMS), the English and German "ring" corresponds to the Gr. ἄμβος, Lat. annulus, Fr. anneau. The enlarged part of a ring on which the device is engraved is called the "bezel," the rest of it being the "hoop." To decorate the human finger with a ring, if possible with one combining beauty, value and a distinctive character, was a widely spread natural impulse. At an early period, when the art of writing was known to but very few, it was commonly the custom for men to wear rings on which some distinguishing sign or badge was engraved (βραχυμον), so that by using it as a seal the owner could give a proof of authenticity to letters or other documents. Thus, when some royal personage wished to delegate his power to one of his officials, it was not unusual for him to hand over his signet ring, by means of which the full royal authority could be given to the written commands of the subordinate (cf. Gen. xli. 42; Esth. viii. 2). Among the Battas of Sumatra rings of a certain form were used as a means of payment.

The earliest existing rings are naturally those found in the tombs of ancient Egypt. The finest examples date from about the XVIIIth to the XXth Dynasty; they are of pure gold, simple in design, very heavy and massive, and have usually the name and titles of the owner deeply sunk in hieroglyphic characters on an oblong gold bezel. Rings worn in Egypt by the poorer classes were made of less costly materials, such as silver, bronze, glass or pottery covered with a siliceous glaze and coloured brilliant blue or green with various copper oxides. Some of these had hieroglyphic inscriptions impressed while the clay was moist. Other examples have been found made of ivory, amber and hard stones, such as carnelian. Another form of ring used in the XIth and subsequent dynasties of Egypt had a scarab in place of the bezel, and was mounted on a gold hoop which passed through the hole in the scarab and allowed it to revolve.

1 To ring," in the sense of to make a bell sound, is a different word. It also appears in various Teutonic languages and is probably of onomatopoeic origin, and may be akin to Lat. clangor.

In ancient Babylonia and Assyria finger rings do not appear to have been used. In those countries the signet took a different form, namely, that of a cylinder cut in crystal or other hard stone, and perforated from end to end. A cord was passed through it, and it was worn on the wrist like a bracelet. This way of wearing the signet is more than once alluded to in the Old Testament (Gen. xxxviii. 18, R.V., and Cant. vii. 6).

Within the limits necessarily imposed by its purpose the finger-ring assumed a considerable variety of form, according to its date and place of origin.

In the Cretan and Mycenaeans periods a characteristic form of ring had a broad flat bezel, not organically connected with the hoop, and having an incised design in the gold. The use of inset stones hardly occurs, but rings from Enkomi and Aegina of the late Mycenaean period have inset paste decorations.

The Phoenician type of ring was primarily intended to carry a scarab or scarabaeoid, usually in a box setting on a swivel, called for by the fact that the flat base of the scarab would be wanted for sealing purposes, but in wear would be most conveniently turned inwards. Strength being necessary, the hoop became massive. A similar arrangement of the signet-scarab is found attached to a twisted ring, which, from its shape, must have been meant to be suspended, and which is shown thus worn on some of the Cyproite terracottas.

The Greek ring of an early period has a characteristic flattened bezel, for an intaglio design in the gold. Such engravings attained great freedom and beauty in the 5th and 4th centuries B.C. An alternative form was a swivel ring for a scarab or scarabaeoid, imitating the Phoenician shape. When the stone was flat and inset the bezel became a mass of metal to hold it securely.

Among the Greeks signet rings were very largely worn. In Sparta a sumptuary law was passed at an early time to forbid any substance more valuable than iron to be used for signet rings; but in other parts of the Hellenic world there appears to have been no restriction of this sort.

In some of the numerous tombs of Etruria and Kertch (Panti- capaeum) in the Cimmerian Bosphorus gold rings of great magnificence have been discovered, apparently of the finest Greek workmanship.

![Fig. 1](image1.png)

Fig. 1 shows a ring from the Crimea with a finely engraved scarabæus in gold, with an intaglio engraving on the base.

![Fig. 2](image2.png)

Fig. 2, also from the Crimea, has a cornelian carved in lion form in place of the scarab, and has an intaglio figure on the base of a running lion.

![Fig. 3](image3.png)

Fig. 3 shows a Greek ring with an incised design in a plain bezel.

![Fig. 4](image4.png)

Fig. 4 is a ring from which the idea of a signet is entirely wanting.

2 Figs. 1–6, 8 and 9 are from Dr Robert Forrer’s Reallexikon, by permission of W. Spemann, Berlin and Stuttgart.
The Etruscans used very largely the gold swivel ring mounted with a scarab, a form of signet probably introduced from Egypt. Some found in Etruscan tombs have real Egyptian scarabs with legible hieroglyphs; others, probably the work of Phoenician or native engravers, have rude copies of hieroglyphs, either quite or partially illegible. A third and more numerous class of Etruscan signet rings have scarabs, cut usually in sard or carnelian, which are a link between the art of Egypt and that of Greece, the design cut on the flat side being Hellenic in style, while the back is shaped like the ordinary Egyptian scarabaeus beetle. One from Etruria, now in the British Museum, is formed by two minutely modelled lions whose bodies form the hoop, while their paws hold the bezel, a scarab engraved with a lion of heraldic character. An alternative type of Etruscan ring (as in fig. 3) has an incised design on the gold bezel, or a flat stone set in the rigid bezel. In either case the Etruscan rings tend to extravagance in size and elaboration.

The Romans appear to have imitated the simplicity of Lacedaemonia. Throughout the republic none but iron rings were worn by the bulk of the citizens, and even these were forbidden to slaves. Ambassadors were the first who were privileged to wear gold rings, and then only while performing some public duty. Next senators, consuls, equites and all the chief officers of state received the *jus annulii aurei*. In the Augustan age many valuable collections of antique rings were made, and were frequently offered as gifts in the temples of Rome. One of the largest and most valuable of the *dactyliothecae* was dedicated in the temple of Apollo Palatinus by Augustus's nephew Marcellus (Pliny, *H. N.* xxxvii. 5). The temple of Concord in the Forum contained another; in this collection was the celebrated ring of Polycrates, king of Samos, the story of which is told by Herodotus; Pliny, however, doubts the authenticity of this relic (*H. N.* xxxvii. 2).

Different laws as to the wearing of rings existed during the empire: Tiberius made a large property qualification necessary for the wearing of gold rings in the case of those who were not of free descent (Pliny, *H. N.* xxxvii. 8); Severus conceded the right to all Roman soldiers; and later still all free citizens possessed the *jus annulii aurei*, silver rings being worn by freedmen and iron by slaves. Under Justinian even these restrictions passed away.

In the rings of the Roman period the decoration is no longer an accessory of the bezel alone. It modifies the form of the hoop, which may be polygonal or angular (see fig. 6). The ring here figured is set with an eye, as an amulet, capable of turning on a swivel.

In the 3rd and 4th centuries Roman rings were made engraved with Christian symbols. Fig. 7 shows two silver rings of the latter part of the 4th century which were found in 1881 concealed in a hole in the pavement of a Roman villa at Fifhead Neville, Dorset, together with some coins of the same period. Both have the monogram of Christ, and one has a dove within an olive wreath rudely cut on the silver bezel. These rings are of special interest, as Roman objects with any Christian device have very rarely been found in Britain.

Fig. 8 is a choice example of a gold key-ring of the Christian period, with good wishes inscribed in pierced gold work—*acipe dulcis, multis annis* (Brit. Mus.).

Fig. 9 is a gold ring from Smyrna (Brit. Mus.) with seven incised intaglio medallions, with a figure of Christ on the bezel. Assigned to the 5th century.

Large numbers of gold rings have been found in many parts of Europe in the tombs of early Celtic races. They are usually of very pure gold, often penannular in form—with a slight break, that is, in the hoop so as to form a spring. They are often of gold wire formed into a sort of rope, or else a simple bar twisted in an ornamental way. Some of the quite plain penannular rings were used in the place of coined money.

Throughout the Middle Ages the signet ring was a thing of great importance in religious, legal, commercial and private matters. The episcopal ring¹ was solemnly conferred upon the newly made bishop together with his crozier, a special formula for this being inserted in the Pontifical. In the earliest references to rings worn by bishops, there is nothing to distinguish them from other signet rings. In A.D. 610 the first mention has been found of the episcopal ring as a well-understood symbol of dignity. It is clear that it was derived from the signet. It was only in the 12th century and onwards that it was brought into mystical connexion with the marriage ring. In the time of Innocent III. (1214) the ring was ordered to be of pure gold mounted with a stone that was not engraved; but this rule appears not to have been strictly kept. Owing to the custom of burying the episcopal ring in its owner's coffin, a great many fine examples still exist.

Among the splendid collection of rings formed by the distinguished naturalist Edmund Waterston, and now in the South Kensington Museum, is a fine gold episcopal ring decorated with niello, and inscribed with the name of Alsthan, bishop of Shoreditch from 824 to 867 (see fig. 10). In many cases an antique gem was mounted in the bishop's ring, and often an inscription was added in the gold setting of the gem to give a Christian name to the pagan figure. The monks of Durham, for example, made an intaglio of Jupiter Serapis into a portrait of St Oswald by adding the legend CAVT S. OSWALDI. In other cases the engraved gem appears to have been merely regarded as an ornament without meaning—as, for example, a magnificent gold ring found in the coffin of Sefrid, bishop of Chichester (1125-1151), in which is mounted a Gnostic intaglio. Another in the Waterston collection bears a Roman cameo in plasma of a female head in high relief; the gold ring itself is of the 12th century. More commonly the episcopal ring was set with a large sapphire, ruby or other stone cut en cabochon, that is, without facets, and very magnificent in effect (see fig. 11).

worn over the bishop's gloves, usually on the forefinger of the right hand; and this accounts for the large size of the hoop of these rings. In the 15th and 16th centuries bishops often wore three or four rings on the right hand in addition to a large jewel which was fixed to the back of each glove.

The papal "Ring of the Fisherman" (annulus piscatoris) bears the device of St Peter in a boat, drawing a net from the water. The first mention of it, as the well-understood personal signet ring of the pope, that has been found, occurs in a letter of Clement IV. in 1265.

"Ring of the Fisherman."

After the middle of the 15th century it was no longer used as the private seal of the popes, but was always attached to briefs. After the death of a pope the ring is broken. A new ring with the space for the name left blank is taken into the conclave, and placed on the finger of the newly elected pontiff, who thereupon declares what name he will assume, and gives back the ring to be engraved (see Waterton, Archæologia, 40, p. 138).

The so-called papal rings, of which many exist dating from the 15th to the 17th centuries, appear to have been given by the popes to new-made cardinals. They are very large thumb rings, usually of gilt bronze coarsely worked, and set with a foiled piece of glass or crystal.

On the hoop is usually engraved the name and arms of the reigning pope, the bezel being without a device. They are of little intrinsic value, but magnificent in appearance.

The giving of a ring to mark a betrothal was an old Roman custom. The ring was probably a mere pledge, pignus, that the contract would be fulfilled. In Pliny's time conservative custom still required a plain ring of iron, but the gold ring was introduced in the course of the 2nd century. This use of the ring, which was thus of purely secular origin, received ecclesiastical sanction, and formulae of benediction of the ring exist from the 11th century. The exact stages by which the wedding ring developed from the betrothal ring can no longer be traced.

Gemel or gimmed rings, from the Latin gemellus, a twin, were made with two hoops fitted together, and could be worn either together or singly; they were common in the 16th and 17th centuries, and were much used as betrothal rings.

Poisy rings, so called from the "poesy" or rhyme engraved on them, were specially common in the same centuries. The name "poisy ring" does not occur earlier than the 16th century. A poisy ring inscribed with "Love me and leave me not" is mentioned by Shakespeare (Mer. of Ven., act v. sc. 1). The custom of inscribing rings with mottoes or words of good omen dates from a very early time. Greek and Roman rings exist with words such as ziznic, xampe, kaah, or vois meis Claudia vivas. In the Middle Ages many rings were inscribed with words of cabalistic power, such as anim sapia, or Caspar, Melchior and Balthasar, the supposed names of the Magi. In the 17th century they were largely used as wedding rings, with such phrases as "Love and obey," "Fear God and love me," "No gift can show the love I owe," "God above increase our love" or "Mulier viro subjecta esto."

In the same century memorial rings with a name and date of death were frequently made of very elaborate form, enamelled in black and white; a not unusual design was two skeletons bent along the hoop, and holding a coffin which formed the bezel.

Cramp rings were much worn during the Middle Ages as a preservative against cramp. They derived their virtue from being blessed by the king; a special form of service was used for this, and a large number of rings were consecrated at one time, usually when the sovereign touched patients for the king's evil.

Decade rings were not uncommon, especially in the 15th century; these were so called from their having ten knobs along the hoop of the ring, and were used, after the manner of rosaries, to say nine aves and a paternoster. In some cases there are only nine knobs, the bezel of the ring being counted in, and taking the place of the gauche in a rosary. The bezel of these rings is usually engraved with a sacred monogram or word.

In the 15th and 16th centuries signet rings engraved with a badge or trademark were much used by merchants and others; these were not only used to form seals, but the ring itself was often sent by a trusted bearer as the proof of the genuineness of a bill of barter.1

At the same time private gentlemen used massive rings wholly of gold with their initials cut on the bezel, and a graceful knot of flowers twining round the letters. Other fine gold rings of this period have coats of arms or crests with graceful lambequins.

Poison rings with a hollow bezel were used in classical times; as, for example, that by which Hannibal killed himself, and the poison ring of Demosthenes. Pliny records that, after Crassus had stolen the gold treasure from under the throne of Capitoline Jupiter, the guardian of the shrine, to escape torture, "broke the gem of his ring in his mouth and died immediately." The medieval anello della morte, supposed to be a Venetian invention, was actually used as an easy method of murder. Among the elaborate ornaments of the bezel of this type point made to work with a spring was concealed; it communicated with a receptacle for poison in a cavity behind, in such a way that the murderer could give the fatal scratch while shaking hands with his enemy. This device was probably suggested by the poison fang of a snake.

A very large and elaborate form of ring is that used during the Jewish marriage service. Fine examples of the 16th and 17th centuries exist. In the place of the bezel is a model, minutely worked in gold or base metal, of a building with high gabled roofs, and frequently movable weathercocks on the apex. This is a conventional representation of the temple at Jerusalem.

Perhaps the most magnificent rings from the beauty of the workmanship of the hoop are those of Benvenuto Cellini produced the finest examples. They are of gold, richly chased and modelled with Caryatides and grotesque figures, and are decorated with coloured enamels in a very skilful and elaborate way. Very fine jewels are sometimes set in these magnificent pieces of 16th-century jewellery.

Thumb rings were commonly worn from the 14th to the 17th century. Falstaff boasts that in his youth he was slender enough to use "creep into any alderman's thumb ring" (Shakes., HEN. IV., Pt. I., act ii. sc. 4).

The finest collections of rings formed in Britain have been those of Lord Londesborough, Edmund Waterton (now in the Victoria and Albert Museum) and the collection in the British Museum, which was greatly augmented in 1897 by the bequest of the late Sir A. W. Franks.

"Anneaux"; articles of Waterton in Archæologia and Archaeological Journal.

RING-GOAL, a game for two persons played on a ground, or indoor rink, 78 ft. long by 10 ft. wide, with a ring of split cane about ¾ in. in diameter and weighing about 3½ oz., which is propelled in the air by means of two sticks, resembling miniature billiard-cues, which are held inside the ring. The goals consist of two uprights 8 ft. high and 10 ft. apart, from which a net is stretched on an incline, so that its base will be a few feet behind the goal-line, and the object of the game is to drive the ring into these goals, each goal made scoring one point. The ring must be propelled by the server and caught by his opponent, on one or both of his sticks, if he can, and so returned alternately, and a point is scored for either player if it be stopped by his opponent in any other manner. A point is also scored for the receiver if the server, who begins the game, throws the ring so that it falls to the ground before

1The celebrated ring given to Essex by Queen Elizabeth was meant to be used for a similar purpose. It is set with a fine cameo portrait of Elizabeth cut in sardonyx, of Italian workmanship.
the receiver can catch it between the creases, which are lines drawn across the court 6 ft. from the goal-lines, or the ring being driven out of court. Elevon's goal, a piece of Italian. Elevon's goal was invented by an under-graduate of Keble College, Oxford, about 1885, and was played at Oxford, but without attracting any wide popularity.

**RINGWOOD**, a market town in the New Forest parliamentary division of Hampshire, England, 103½ m. S.W. by W. from London by the London & South-Western railway. Pop. (1901) 4020. It lies pleasantly on the river Avon, which here divides into numerous branches, flowing through flat meadow land. The church of SS. Peter and Paul, which was almost entirely reconstructed in 1854, the town hall and corn exchange are the chief buildings. A large agricultural and manufacturers of agricultural implements, linen goods and woollen goods are carried on.

**RINGWORM** (or *Tinea tonsurans*), a disease of the scalp (especially common within the tropics); it consists of bald patches, usually round, and varying in diameter from half an inch up to several inches, the surface showing the broken stumps of hairs and a fine whitish powdering of desquamated epidermic scales. In scrofulous subjects matter is sometimes produced, which forms crusts, or glues the hair together, or otherwise obscures the characteristic appearance. The disease is due to a parasite, *Trichophyton tonsurans*, which consists mostly in the form of innumerable spores (with hardly any mycelium), and is most abundant within the substance of the hairs, especially at their roots. If a piece of the hair near the root be soaked for a time in dilute liquor potassae and dressed flat under a cover-glass, the microscope will show it to be occupied by long rows of minute oval spores, very uniform in size, and each bearing a nucleus.

The same fungus sometimes attacks the hairs of the beard, producing a disease called “sycosis.” Sometimes it invades the hairless regions of skin, forming “tinea circinata”; circular patches of skin disease, if they be sharply defined by a margin of papules or vesicles, may be suspected of depending on the tinea-fungus. Interesting varieties of tinea are found in some of the Pacific and East Indian islands. Among the best remedial agents are various mercurial preparations. But in modern practice much success has been found in X-raying the patch in order to remove the dead and diseased hairs, thus leaving a free channel for the passage of antiseptic applications to the follicles. The exposures are followed by inunction of a mercurial preparation or of a lotion of tincture of iodide with methylated spirit.

**RINTOUL, ROBERT STEPHEN** (1782-1838), British journalist, was born at Tibbermore, Perthshire, in 1782, and educated at the Aberdeen parish school. After serving his apprenticeship to the printing trade he became the printer and subsequently the editor of the *Dundee Advertiser*. In 1826 he came to London, and in July 1828, with the assistance of friends, founded *The Spectator*. In it Rintoul strongly supported the Reform Bill, and to him was due the catch-phrase “The bill, the whole bill, and nothing but the bill.” After conducting *The Spectator* for more than thirty years, he sold it shortly before his death, which occurred on the 22nd of April 1838.

**RINUCCINI, GIOVANNI BATTISTA** (1592-1653), archbishop of Fermo, was born in Rome on the 18th of September 1592, being the son of a senator. He studied at several universities, became chamberlain to Pope Gregory XV., and in 1625 was made archbishop of Fermo. His participation in Irish politics, which is his chief title to fame, began during the later stages of the Civil War when Ireland was the scene of universal disorder. In 1645 Pope Innocent X. despatched him to that country as papal nuncio; he landed at Kenmare with arms and money in October 1645, and took up his residence at Kilkenny. Before this time the Roman Catholics had banded themselves together for defence. Called the Confederate Catholics, they had set up a provisional government, and when the nuncio reached Kilkenny they were engaged in negotiating for peace with the lord lieutenant, the marquess, afterwards duke, of Ormond. Rinuccini took part in the proceedings, but as his demands were ignored he refused to recognize the peace which was concluded in March 1646, and gaining the support of the Irish general, Owen Roe O'Neill, he used all his influence, both ecclesiastical and political, to prevent its acceptance by others. To a large extent he succeeded. Meeting at Waterford, the clergy condemned the treaty and several towns took up the same attitude. The nuncio's most pliant helper was now Edward Somerset, earl of Glamorgan, afterwards marquess of Worcester, who had been sent to Ireland by Charles I., and who had entered into communication with Rinuccini when the latter first arrived in that country. Glamorgan bound himself to carry out all the wishes of the nuncio, who intended that he should supplant Ormonde. In September 1646 Rinuccini took over the conduct of affairs. He imprisoned his opponents on the council and tried to arrange for an exchange on Dublin. But there was no harmony among his subordinates, his military plans failed and soon all parties were tacitly ignoring him. Leaving Kilkenny he stayed for some time in Galway, and in February 1649 he left Ireland. After visiting Rome he returned to Ferriano in 1650 and died on the 5th of December 1653.

**RIOBAMBA** or RAYOBAMBA, a town of Ecuador, capital of the province of Chimborazo, on the railway between Guayaquil and Quito, about 83 m. E.N.E. of the former. Pop. (1900, estimate) 12,000. It stands in a barren, sandy basin of the great central plateau, drained by the Chamo, a tributary of the Pastaza, on the old road running southward from Quito into Peru, 9030 ft. above sea-level, and in full view of the imposing heights of Chimborazo, Carahauri (Carguairazo), Tunguragua and Altar. Though 300 ft. lower than Quito, its climate is considerably colder, owing, perhaps, to its more exposed situation and the vicinity of so many snow-clad peaks. It is a town of unusually wide streets and one-storeyed adobe houses, being so laid out and built because of earthquakes. It has a very lively little market as a commercial or industrial centre, having only a small trade and a few unimportant industries. The present town dates from 1707; when the great earthquake of that year destroyed the old town then situated 12 m. W., near the existing village of Cajas. The ruins of the old town indicate that it was much larger and finer than its successor.

**RIO CUARITO**, a town of Argentina in the province of Córdoba, 110 m. S. of the city of that name, and about 500 m. N.W. of Buenos Aires. Pop. (1904, estimate) 12,000. It stands 1440 ft. above sea-level and about half-way across the great Argentine pampas, on the banks of a river of the same name which finds an outlet through the Caracatal into the Parana near Rosario. The town is built on the open plain and is surrounded with attractive suburbs. It is the commercial centre of a large district and has a large and lucrative trade. Its geographical position gives it great strategical importance, and the government maintains here a large arsenal and a garrison of the regular army. The surrounding country belongs to the partially arid pampa region and is devoted to stock-raising, with large herds of sheep and goats. Irrigation is employed in its immediate vicinity. Pampa region was overrun by the Ranqueles, a warlike tribe of Indians, but the vigorous reprisals of General Ivanovski in that year, supplemented by the tactful intervention of the Franciscan missionaries, who have a convent in this town, put an end to these hostile forays and gave full opportunity for the industrial development of the country. There are some manufacturing industries in the town. The National Andine railway passes through Rio Cuarto, and branch lines connect with the Buenos Aires and Pacific line—all of which give railway communication.
with Bueno Aires, Rosario, Tucuman, Cordoba, San Luis and Mendoza.

**RIO DE CONTAS,** or **VILLA DE CONTAS,** a town of Brazil in the state of Bahia, 230 m. S.W. from the city of Bahia, on the Brumado (Contas-Pequeño), a head stream of the Rio de Contas (Jussiaye), which rises on the eastern slope of the neighbouring Serra das Almas, and flows S.E. and E. to the Atlantic coast at Barra do Rio de Contas. Pop. (1850), including rural districts, 17,318. The surrounding country is fertile and produces sugar, cotton, mandioca and tobacco, but has lost much of its prosperity through the droughts that have devastated the interior of the state, and because of the costs of transporting produce to market. Stock-raising was at one time an important industry here. The town was founded in 1715 by some “Paulistas” who discovered gold there in the sands of the river. It became a “villa” in 1724, but was soon afterward moved down the river 5 m. to a more convenient site on the high road between Bahia and Goyaz.

**RIO DE JANEIRO,** a maritime state of Brazil, bounded N. by Minas Geraes, E. by Espirito Santo and the Atlantic, S. by the Atlantic, and W. by Sao Paulo. It is one of the smaller states of the republic and has an area of 26,635 sq. m.; pop. (1900) 926,685. The state is traversed longitudinally by the Serra do Mar, which divides it into a low, narrow, irregular coastal zone, and a broad elevated river valley through which the Parahyba flows eastward to the Atlantic. The eastern part of this valley widens out into a great alluvial plain on which are to be found some of the richest sugar estates of Brazil. The central mountainous region is heavily wooded, the coast region is hot and in places malarial, but the valleys are fertile and well watered. The Parahyba valley has long been celebrated for its fertility, and was for many years the centre of the coffee-producing industry. The exhaustion of the soil and antiquated methods of cultivation have caused a great decline in this industry, and many of its coffee plantations are now either abandoned or are producing but a fraction of earlier crops. Stock-raising has been slowly developing since the abolition of slavery (1888) and the decline in coffee production, and the state now possesses large herds of cattle and droves of swine.

The state’s agricultural and pastoral products are coffee, sugar, rum, Indian corn, mandioca (both bitter and sweet), cotton, tropical fruits, cattle, hogs, butter, cheese, fresh milk and lard. The state is well watered by the Parahyba (g.s.) and its tributaries and by numerous short streams flowing from the Serra do Mar to the coast. Irrigation has been developed largely because of the fine water power supplied by the mountain streams, and among the manufactures are cotton, woolen, silk and jute fabrics, brick, tile and rough pottery, sugar, rum, vehicles, furniture, beer and fruit preserves. The state is well provided with railways, which include the Central do Brazil, Leopoldina, Melhoramentos and Rio do Ouro. The Central line runs from the city of Rio de Janeiro N.N.W. across the Serra do Mar to the Parahyba valley, while the Minas e Estudos do interior at the station of Barra de Pirahy, one running westward to Sao Paulo, and the other eastward and northward into Minas Geraes. Besides these there are a number of short railways called the Therodespis, Uniao Valencian, and Ferrocosta. The extension of these railways in the state in 1907 was 1445 m. Other than Niteroy, the ports of the state are Sao Joao da Barra, Macahe or Imbectha, Cabo Friar and Paraty, but they are visited only by the smaller coastal vessels.

The capital of the state is Niteroy on the E. side of the Bay of Rio de Janeiro, and other cities and towns, with their populations in 1890 except where otherwise stated, are: Campos (estimate, in 1907, 35,000), on the lower Parahyba in the midst of a rich sugar-producing region; Rio Bonito (19,321); Itaborahy (17,817); Barra Mansa (14,449), on the upper Parahyba; Resende (14,370), in a fertile district of the upper Parahyba; Petropolis (g.s.); Cantagalo (about 9000), in a rich coffee district of the Serra do Mar; Paraty (10,765), a small port on the W. side of the bay of Angra dos Reis; Valenga (11,962); Vassouras (9600); Sao Fidelis (11,770), a river port on the lower Parahyba having steamboat communication with Campos; Macahe (about 7000 in 1900), an old port on the eastern coast of the state at the mouth of the Macahe river whose original anchorage has been filled with silt, and that of Imbectha, in the vicinity, with which it is connected by tramway, is now used by vessels both for the town and the Macahe and Campos railways; Barra do Pirahy (7750), an important station and junction of the Central do Brazil railway on the N. side of the Serra do Mar, with large manufacturing and commercial interests; Parahyba do Sul (7543), in a fertile, long-settled district in the N.E. part of the state; Marica (10,373); Cabo Friar (10,382); Pirahy (10,429); Saquarema (12,480); Nova Friburgo (9857); and Araruama (9087).

**RIO DE JANEIRO** (in full, SÃO SEBASTIÃO DO RIO DE JANEIRO, colloquially shortened to Rio, a city and port of Brazil, capital of the republic, and seat of an archbishopric, on the western side of the Bay of Rio de Janeiro, or Guanabara, in lat. 25°54'23" S., long. 43°58'54" W. (the position of the Observatory) The city is situated in the S.E. angle of the Federal District (Distrito Federal) formerly known as the Neutral Municipality (Municipio Neutro), an independent district or commune with an area of 584 sq. m., which was detached from the province of Rio de Janeiro in 1854. The city is divided into two parts on an alluvial plain formed by the filling in of the western shore of the bay, which extends inland from the shore-line in a north-westly direction between a detached group of mountains on the S. known as the Serra da Carioca, and the imposing wooded heights of the Serra do Mar on the N. The spurs of the Carioca range project into this plain, in some places, closely up to the margin of the bay, forming picturesque valleys within the limits of the city. Some of the residential quarters follow these valleys up into the mountains and extend up their slopes and over the lower spurs, which, with the hills covered with buildings rising in the midst of the city, give a picturesque appearance. At the entrance to the bay is the Sugar Loaf (Pao de Assucar), a conical rock rising 312 ft. above the water-level and forming the terminal point of a short range between the city and the Atlantic coast. The culminating point of that part of the Carioca range which projects into and partly divides the city is the Corcovado (Hunchback), a sharp rocky peak 2329 ft. high overlooking the Botafogo suburb and approachable only on the wooded N.W. side. These spurs are covered with luxuriant vegetation, excepting their perpendicular faces and the slopes occupied by the suburbs. Considerably beyond the limits of the city on its S.W. side, but within the municipality, is the huge isolated flat-topped rock known as the Gavea, 2575 ft. high, which received its name from its resemblance to the square sail used on certain Portuguese craft. The sky-line of this range of mountains, as seen by the approaching traveller some miles outside the entrance to the bay, forms the rough outline of a huge reclining figure called “the sleeping giant,” the facial profile of which is also known as “Lord Hood’s nose.”

The entrance to the bay, between the Sugar Loaf on the W. and the Pico on the E., with fortress of Santa Cruz on one side and the fort of Santa Teresa on the other, is about a mile wide and free from obstructions. Almost the whole of the entrance navigation channel is the little island and fort of Lage, so near the level of the sea that the spray is sometimes carried completely over it. On the W. is the semicircular bay of Botafogo, round which are grouped the residences of one of the richest suburbs; on the E., almost land-locked bay of Jurujuba (see Niteroy). The bay extends northward nearly 16 nautical miles, with a maximum breadth of 11 m. and a minimum, between the arsenal of war (Ponta do Calabouço) and the opposite Ponta da Gravatait, of about 3500 yds. The shore-line is irregular, and has been modified by the construction of sea-walls and the filling in of shallow bays. Close to the shore are the islands of Villegaignon (occupied by a fort), Cobras (occupied by fortifications, naval storehouses, hospital and dry docks), Santa Barbara and Encadas, the site of the Brazilian naval school. A small island just above the lower anchorage, which is occupied by port officials, was once known as Rat island, and is now called Ilha Fiscal. There is one lake...
within the urban limits, the Lagoa de Rodrigo de Freitas, near the Botanical Garden, separated from the sea by a narrow sand beach, which is being gradually filled in. Several small streams from the hills are conspicuous only in times of heavy rains.

The oldest part of the city, which includes the commercial section, lies between Castle and Santo Antonio hills on the S. and Sáo Bento, Conceição and Livramento hills on the N., and extends inland to the Praça da República, though the defensive works in colonial times followed a line much nearer the bay. This section during the past century has extended southward along the bay shore in a string of suburbs known as the Castétte and Botafogo, with that of Larangeiras behind the Castetete in a pretty valley of the same name, and thence on or near the Atlantic coast as Largo dos Leões, Copacabana and Gavea, the last including the Botanical Garden. The greatest development has been northward and westward, where are to be found the suburbs of Cidade Nova, São Cristovão, Engenho Novo, Pr. l,a Formoso, Pedregulho, Villa Isabel, Tijuca, and a number of smaller places extending far out on the line of the Central railway. The extreme length of the city along lines of communication is little less than 20 m. Streets.—Some of the most modern streets on the plain have been laid out in the French-Italian style. The greater part seems to have sprung into existence without any plan. Most of the streets of the old city are parallel and cross at right angles, but they are narrow and enclose blocks of unequal size. Each block of streets is marked off from the rest by the original grain of the old land, and crooked roads where the shore-line or mountain contour compels. Since the beginning of the 19th century, large sums have been borrowed and expended on new avenues, the widening and other of old streets, and the improvement of the waterfront between the Passeio Publico and the southern extremity of the Praia de Botafogo by the construction of a grand boulevard, partly on reclaimed land. One of these improvements consists of a central avenue cut across the old city from the Praça de Angolo jusqu a l’onde, the Praia de Botafogo, over the Sauipe water-front. The shore-line boulevard, called the Avenida Biria-Mar, is about 44 m. long, the wider parts being filled in with gardens. It was undertaken in 1903, during the administration of President Rodrigues Alves, as part of a vast scheme to improve the sanitary and traffic conditions of the city, including the construction of a new shore-line and filing in the shallow parts of the shore, which had long been considered one of the prime causes of the unhealthy state of the city. Another improvement was the completion and embellishment of the Mangue canal, originally designed as an entrance to a central market for the boats plying on the bay, but now destined for drainage purposes and the provision of a centralized sewage system. A gated, nearly 2 m. long, enclosed with stone walls, crossed by a number of iron bridges and bordered by lines of royal palms. The most famous street of the old city is the Rua do Ouvidor, running westward from the market-place to the Largo de São Francisco de Paula, and famed for its churches and public buildings. It has long been a favourite promenade, and fills an important part in the social and political life of the city. The principal business street is the Rua Primeiro de Março, formerly called Rua Direita, which extends from the Praça 15 de Novembro northwards to Saint Bento Hill. All these old streets, excepting the last, are narrow and paved with squared granite blocks, and have their vehicle traffic regulated to go in one direction only. The side walks are very narrow and sometimes but little separated from the road. The buildings of the Praça de Angolo jusqu al’onde are a mixture of the Portuguese and French styles, the older number bearing marks of the French influence, and the newer of the Portuguese. The Praça do Ouvidor and some other narrow streets having a great number of gas-pipe arches across them for decorative illumination on festival occasions.

Water Supply and Sewage Drainage.—The water supply is derived from three sources: the small streams flowing down the mountain sides which serve small localities; the old Carioca aqueduct, dating from colonial times, which collects a considerable supply from the small streams of the Serra de Carvoeira and brings it into the city through a covered conduit which once crossed the gap between Santa Theréza Tramway and Santo Antonio hills on two ranges of stone arches (now used as a viaduct by the Santa Theréza Tramway Company); and the modern Rio do Ouro waterworks, which brings in an abundant supply from the Serra do Tintu, N.W. of the city—the length of the iron mains being 33 m. between the principal collecting reservoir and the main distributing reservoir at Pedregulho, near the Ponta do Cajú. There are three other distributing reservoirs in different parts of the city, and the supply, which has been augmented since the works were inaugurated in 1885, is good and ample. An extensive system of sewers was constructed by the City Improvements Co., an English corporation, which initiated the work in 1853; and a separate system of rain-water drains. The Leicester system is used because the greater part of the sewers are below sea-level, and it is necessary to use powerful pumps.

Climate.—The climate of Rio de Janeiro is hot, humid and debilitating, the temperature ranging from 90° to 99°F. in the shade, with an average for the year of 74°, and the rainfall being about 44 in. The greater part of the city is only 2 or 3 ft. above the high-water mark, in its terraces, and hence large areas of water, swamp and wet soil in its immediate vicinity. But the unhealthiness of Rio de Janeiro in past years may be charged to insanitary conditions and not to the climate. Yellow fever, whose first recorded appearance was in December 1849, was for many years almost a regular yearly visitant, and the mortality from it has been terrible. Smallpox also is practically endemic, owing in great part to negligent sanitary supervision. Since 1900 there have been several mild outbreaks of bubonic plague. These dangerous diseases are slowly disappearing as sanitary conditions are improved. The death-rate from tuberculosis, however, is high, and apparently shows no abatement. This is undoubtedly due to constitutional weakness arising from bad nutrition and the habit of sleeping in closed or badly ventilated apartments. Malarial fevers are also common, and diseases of the digestive organs, in great part easily preventible, figure among the principal causes of death. According to official returns for the five years 1900-1905, the average number of deaths was 15,926, or 20.4 per 1000. Among the deaths 2780 were from tuberculosis, 1200 from smallpox, 770 from malarial diseases, 331 from la grippe, and 106 from beri-beri. There were no unusual epidemics during those years, and the rate given may be considered normal.

Buildings.—There remain many public edifices and dwellings of the colonial period, severely plain in appearance, with heavy walls and tile roofs. The old city palace facing Praça 15 de Novembro, the old School, the old Imperial chapel facing the Praça 15 de Novembro being used for that purpose. The foundations were once laid for a great cathedral on the Largo de São Francisco de Paula, but the building stone was taken for a neighbouring theatre, and the foundations were afterwards used for the Poly- technic School modelled on the English Poly- technic; the National chamber, in the commercial district, whose twin towers and graceful dome form one of the most conspicuous landmarks of the city. It was begun in 1775, but was not finished until near the end of the last century. Its fine proportions, however, are conceded by the commercial buildings and by the narrow streets. Among many other churches, usually plain and bare of interior decoration, are the popular São Francisco de Paula church, on the square of that name; the Carricho Church in Rua 15 de Março, the Cruz dos Milites church in the same street; the Rosario church in the
RIO DE JANEIRO

355

street of that name, belonging to a fraternity of negroes and once occupied by the episcopal chapter; and the prettily situated octagonal Gloria church on a hill of that name overlooking the lower bay. Another church of the same name faces the Largo do Machado and shows late-baroque combination of a Greek temple crowned by a modern spire. The British residents have an unpretentious chapel in Praia Evaristo da Veiga, the Methodists a more modern structure on the Largo do Castello and the Presbyterians a chapel near Praça Tiradentes. There is religious toleration to the extent that the non-Catholic church or chapel was permitted to have a spire or other outward symbol of a place of worship.

Among public buildings of an official character the following are noteworthy; the palace of Praca 15 de Novembro, occupied from 1743 and was the residence of the royal governors and Dom João VI., but is now used by the national telegraph offices. The São Cristovão palace, in the suburb of that name, was the residence of Dom João, after 1836. Of the official buildings of the capital, however, the most important is the National Museum. The Castello palace, on the street of that name, originally a private residence, is now the official residence of the President, richly decorated within and partly surrounded by a handsome park. The Itamaraty Palace in Praça da Republica, a typical private residence of the better class, was purchased for and occupied by the first presidents and is now occupied by the ministry of foreign affairs. The palace of justice, on Rua Primeiro de Marco, is one of the finest edifices in the city; and that at Praça Dom Pedro I., one of the most imposing. The Praça 15 de Novembro a may be noticed. The ministry of war has its offices in the immense military quartel (barracks) on the north side of the Praça da Republica, and the ministry of marine in the enormous building on the foreshore of the bay. The government of the city, which is in the Treasury building on Rua do Sacramento an immense structure of no special architectural merit. The Senate occupies a plain unattractive building on the west side of the Praça da República. There is but one college of any note, the one connected with the college of Sao Paulo, and the two old colleges of Santo Christovao, in São Cristovão, and São João Baptist, in Botafogo, the former having an unconserved section for Protestants. Besides these there are five private charities, the one belonging to the British colony being on a hill overlooking the Gambia shore.

Harbour, Communications and Commerce. — The port and harbour of Rio de Janeiro are the largest and most important in the republic. The entrance is open to vessels of the largest draught, and there is sufficient deep-water anchorage inside for the navies of the world. The lower anchorage, where the officers of health visit vessels, is below Ilha Fiscal, and the upper, or commercial anchorage, is in the broad part of the bay above Ilha das Cobras, the national coal vessels occupying the shallower waters near the Saúde and Gambóa districts. The custom-house occupies a considerable part of the shore-line in front of the old city, and has a protected basin for the discharge of lighter. The new port works, under construction since 1903, consist of a new water-front for the Saúde, Gambóa and a large area, and enclosing small reclaimed areas. The commercial quays are built in deep water and permit the mooring alongside of the largest vessels. The total length of the coaling stations, with two railway and tramway lines to and from the industrial docks, is 12 miles. Electric power are available. Special surtaxes are levied on imports to meet the interest and redemption charges on the loans raised for the execution of these important works. Another improvement is the extension of the sea-wall southward from the ferry-slips (Rua 15 de Novembro) to the Ponta do Calabouço (war arsenal), providing protected basins for the arsenal and enclosing small reclaimed areas. With the completion of these improvements the water-front of the city will consist entirely of deep-water walls from Botafogo to the Ponta do Caçá, with the exception of a short section between the Ponta do Calabouço and the Avenida Central. The port is in regular communication with the principal ports of Europe and America. The coastwise service is good, though rates are high. Railway communication with the interior is maintained by the Central do Brazil (formerly the Dom Pedro II.), Leopoldina and Melhoramentos lines, besides which there is a short passenger line up to the Corcovado about 2½ m. long, an electric line to Tijuca, and a narrow-gauge line running out to the Rio do Ouro waterworks.

There is daily communication with Petropolis by a branch line of the Leopoldina system, and also by a steamer to the head of the bay and thence by rail up the Serra Jurujuba. Ferryboats cross the bay to Niterói at intervals of 20 minutes, and smaller craft provide communication with the islands of Gobernador and Paquetá.
RIO DE JANEIRO

Río de Janeiro is the seaport for a large area of the richest, most productive and most thickly settled parts of Brazil, including the states of Rio de Janeiro and Minas Geraes and a small part of eastern São Paulo. Its exports include coffee, sugar, hides, cabinet woods, tobacco and cigars, tapioca, gold, diamonds, mangelana and sundry small products. Rio is also a distributing centre in the coasting trade, and many imported products, such as jerked beef (carne seca), hay, flour, wines, &c., appear among the coastalwise exports. The principal exports were officially valued at £6,762,033 milreis gold, or little over one-sixth of the exportation of the whole country. Formerly Rio led all other ports in the export of coffee, but the enormous increase in production in the state of São Paulo has given Santos the preeminence. The quantity of coffee exported was 3,062,268 bags of 60 killogrammes each, officially valued at about £27,846,000. The coffee-producing area tributary to this port is slowly decreasing, owing to the exhaustion of the soil and the growth of competing industries. The principal imports are rice, flour, Indian corn, jerked beef (carne seca), lard, bacon, wines and liquors, butter, cheese, conserves of all kinds, coal, cotton, woollen, linen and silk textiles, boots and shoes, earthen- and glassware, railway material, machinery, furniture, building materials, and pine lumber, drugs and chemicals, and hardware. The imports for 1905 aggregated 103,874,754 milreis gold, or about two-thirds the importation of the whole republic. The shipping arrivals in 1908 were as follows: from foreign ports, 1,195 steamers of 3,479,357 tons with 16,134,151 passengers and 1,724,618 tons of 243 foreign steamers of 82,633 tons, 773 national steamers of 475,887 tons and 294 national sailing vessels of 20,250 tons—in all 2,565 vessels of 4,632,301 tons.

Mineral Products.—The industrial activities of Rio Janeiro have been largely increased since the organization of the republic through increased import duties on foreign products. There were a number of protected industries before this, but they made slight impression on the trade. Besides the large exports of coffee, cotton, wool, rice, wheat, cotton, woolen and silk textiles, boots and shoes, ready-made clothing, furniture, vehicles, cigars and cigarettes, chocolate, fruit conserves, refined sugar, biscuits, macaroni, ice, beer, artificial liquid extracts, mineral waters, soaps, medicines, perfumery, feathers, flowers, printing type, &c. There are numerous machine and repair shops, the most important of which are the shops of the Central railway. One of the most important industrial enterprises in the city is the Bahia-São Paulo Company, which supplies electric currents for public and private lighting, and power for the tramways and many industries. The hydro-electric works are situated about 50 m. N.W. of the city in a valley of the Serra do Mar, where a large reservoir has been created by building a dam across the Rio das Lages.

Government.—Rio de Janeiro is governed by a prefect, who represents the national government, and a municipal council which represents the provincial government. The prefect is appointed by the president of the republic for a term of four years, and the appointment must be confirmed by the Senate. There are seven directors, or boards, under the prefect, each one assigned to a special field of work, chief among these being the supervision of commerce, the council of the port, works and transportation, and finance. The municipal council is elected by direct suffrage for a term of two years, and is composed of 15 members. The funded debt of the city on the 30th of June 1907 was £1,700,677, a part of which is guaranteed by the national government. There is some confusion in administration and accounts, however, and it is sometimes difficult to determine the exact situation. The Federal District is represented in Congress by 2 senators and 10 deputys, and is credited with the rights and privileges of citizenship. On the other hand, the city is a garrison town and a district under the direct administration of the national executive, who appoints its chief executive, controls its police force, and exercises part control over its streets, squares and water front. In the latter respect the city resembles many French towns, the expense of the commercial quays, the filling of the São Christoávão bay, the opening of the Mangue canal and its embankment, the opening of the Avenida Central, the extension of the sewage system and the construction of a great number of public buildings. The former supply of water was responsible for the Avenida Beira-Mar, the opening of a new avenue from the Largo da Lapa westward to Rua Frei Caneca, the removal of the Morro do Senado, the widening of some streets across the Avenida Central and the opening and straightening of other streets.

History.—The discovery of the Bay of Río de Janeiro is attributed by many Portuguese writers to André Gonçalves, who entered its waters on the 1st of January 1502, and believed that it was the mouth of a great river, hence the name Rio de Janeiro (River of January). Another Portuguese navigator, Martim Afonso de Souza, visited it in 1513, but passed on to São Vicente, near Santos, where he established a colony. The first settlement in the bay was made by an expedition of French Huguenots under the command of Nicholas Durand Villegaignon, who established his colony on the small island that bears his name. In 1560 their fort was captured and destroyed by a Dutchman named Janssen and his followers. In 1567 another expedition under the same commander again destroyed the French settlements, which had spread to the mainland. The victory was won on the 20th of January, the feast-day of St Sebastian the Martyr, who became the patron saint of the new settlement and gave it his name—São Sebastião do Rio de Janeiro. The French had named their colony La France Antarctique, and their island fort had been called Fort Colongy. In 1710 a French expedition of five vessels and about 1,000 men under Duclerc attempted to regain possession, but was defeated; its commander was captured and later assassinated. This led to a second French expedition, under Duguy Trouin, who entered the bay on the 21st of September 1711, and captured the town on the 22nd. Trouin released Duclerc’s imprisoned followers, exacted a heavy ransom and then withdrew. The discovery of gold in Minas Geraes at the end of the 17th century greatly increased the importance of the town. It had been made the capital of the southern captaincies in 1680, and in 1762 it became the capital of all Brazil. In 1768 the fugitive Portuguese colonist, D. Paulo Teixeira da Gama, was given the title of Count of Rio de Janeiro, and gave a new impulse to its growth. It was thrown open to foreign commerce, foreign mercantile houses were permitted to settle there, printing was introduced, industrial restrictions were removed, and a college of medicine, a military academy and a public library were founded. Dom João VI. returned to Portugal in 1821, and on the 7th of September 1822 Brazil was declared independent and Dom Pedro I. became its first emperor. There was no resistance to this declaration in Rio de Janeiro. There were some political disorders during the reign of Dom Pedro I., who was finally assassinated in an abdication in favour of his son, Dom Pedro II., on the 7th of April 1831. The regency that followed was one of many changes, and led in July 1840 to a declaration of the young prince’s majority at the age of fifteen. A long and peaceful reign followed, disturbed only by the struggles of rival political factions. In 1839 a steamship service along the coast was opened, but direct communication with Europe was delayed until 1850, and with the United States until 1861. These services added largely to the prosperity of the port. The first section of the Dom Pedro II. railway was opened in 1858, and the second or mountain section in 1864, which brought the city into closer relations with the interior. In 1874 submarine communication with Europe was opened, which was soon afterwards extended southward to the Plateine republics. The first coffee tree planted in Brazil was in a convent garden of Rio de Janeiro. On the 15th of November 1889 a military revolt in the city under the leadership of General Deodoro da Fonseca led to the declaration of a republic and the expulsion of the imperial family, which was accomplished without resistance or loss of life. Disorders followed, a naval revolt in 1891 causing the resignation of President Deodoro da Fonseca, and another in 1893-94 causing a blockade of the port for about six months and the loss of many lives and much property from desultory bombardments. There have been since that time some trifling outbreaks on the part of agitators allied with the extreme republican element, but at no time was the security of the government in danger.

Bibliography.—Nearly all books relating to Brazil date from 1500 to 1850, and when it comes to a critical and accurate study of colonial development will be found in Robert Southey, _History of Brazil_ (3 vols., London, 1810–19). For descriptions of the city, the customs and manners of its people and some of the larger political events of Brazil from the 19th century, see R. Walsh, _Notices of Brazil_ in 1826 and 1829 (2 vols., London, 1830); Thomas Ewbank, _Life in Brazil_ (New York, 1856); M. D. Moreira de Azevedo, _O Rio de Janeiro_ (2 vols., Rio, 1877); and J. C. Fletcher and D. P. Kidder, _Brazil and the Brazilians_ (New York, 1882). For later and more recent descriptions, see A. J. Lamoureux, _Hand-Book of Rio de Janeiro_ (Rio de Janeiro, 1887); Frank Vincent, _Around and About South America_ (New York, 1890), chapters xxv, to xxix; Marguerite Dickins, _Along Shore with a Man-of-War_ (Boston, 1893); Arthur Dias, _Il Brasile Attuale_ (Nivel, Belgium, 1907; also in French and Portuguese), pp. 367-449.
RIO DE ORO, a Spanish possession on the N.W. coast of Africa. It is bounded W. by the Atlantic, E. and S. by Saharan territory under French protection. The northern frontier, where the protectorate adjoins the territory of the semi-independent tribes south of Morocco, is undefined. The most northerly point claimed by Spain on the coast is Cape Bojador. The southern and eastern boundaries were defined by a Franco-Spanish convention in 1900. The frontier traverses the middle of the Cape Blanco promontory, then runs eastward along the parallel of 21° 30' N. till it meets the meridian of 13° W., whence it turns first N.W. and afterwards N.E., meeting the tropic of Cancer at 15° W. and thereafter runs due N. Forming part of the Sahara, Rio de Oro is nearly waterless. Oases are few and the sparse population consists almost entirely of nomad Arabs and Berbers. They are Mahomedans. In the south is the hilly country called Adrar Suttuf, not to be confounded with Adrar Temur (see ADRAR and SAHARA). The estimated area of the protectorate is 70,000 sq. m.

The peninsula of Rio de Oro, where is the principal Spanish settlement, occupies the central part of the coast-line in 23° 50' N. and 16° W. and extends to the southern limits of the strait. Its length is 23 m., its breadth ½ to 2 m. and it is on an average about 20 ft. above sea-level. The bay between peninsula and mainland—the so-called Rio de Oro—is 22 m. long, 5 broad, navigable over two-thirds of its extent, with good anchorage in most of the channel, but the bar at its mouth is not always easy to pass in rough weather. The peninsula has very sparse vegetation, except in its southernmost part near Cape Durnford. At the head of the bay is a small island—Isla Herne.

The climate is generally temperate, and not unhealthy except in the autumn. Esparto grass and manzanilla are grown in many places, but European plants are not easily acclimatized. On the peninsula and in the neighbouring country there are many wolves, foxes, hyenas, gazelles, lizards, hares, pelicans and large crows. The natives rear cattle, sheep, camels, and have but few horses. In contrast with the sterility of the land the sea throughout the coast of Rio de Oro abounds in fish, especially cod. The fishing industry is in the hands of the Canary Islanders and of the French.

The estuary between the mainland and the peninsula was taken by its Portuguese discoverers in the middle of the 15th century for a river, and obtaining there a quantity of gold dust from the natives, they named it Rio d'Ouro (Gold River), Rio de Oro being the Spanish form. At a spot about 50 m. inland from the head of the estuary a Portuguese trading station was established, of which ruins exist, but the activity of the Portuguese was before long transferred to the true auriferous regions of the Gulf of Guinea.

Spain's interest in the Saharan coast dates from the 13th century, but was particularly directed to that part nearest the Canary Islands, a strip of coast over which she now exercises no sovereignty. The site of the fort of Santa Cruz de Mar Pequeña, established in 1476, though not identified, was north of Cape Bojador. The protection of the Canary Islanders engaged in the fisheries south of that point occasioned, however, the presence of Spanish warships in these waters, and small trading stations were formed at Rio de Oro, Cape Blanco and elsewhere. To preserve the interests thus acquired, Spain in January 1885 took the territories on the coast between Cape Blanco and Bojador under her protection. The year before the Hispano-American Company had built a trading station on Rio de Oro peninsula, but in 1885 it was destroyed by the natives. The company renewed its operations, but subsequently ceded its rights to the Transatlantic Company of Barcelona. The extension inland of Spanish influence was opposed by France, which claimed a protectorate over the Sahara. The conflicting claims of the two powers were finally settled by the convention of 1900, which fixed the frontier in the manner stated. The administration is carried on under the control of the captain-general of the Canary Islands.

RIO GRANDE, a North American river, which rises in the San Juan Mountains of southern Colorado, flows S.E. and S. in Colorado, S. by W. and S.E. through New Mexico, and S.E. between Texas and Mexico to the Gulf of Mexico. Its length is approximately 2200 m., and for about 1300 m. it forms the international boundary between the United States and Mexico. It presents many features of a complex physiographic type, being first a river of the Rocky Mountains, then of the interior deserts and then of the Atlantic Coastal Plain. It also presents a complicated geological history, as it includes what were originally several distinct streams. The Mexicans call it the Rio del Norte in its upper course, the Rio Bravo in the "Big Bend," from the mouth of the Conchas river to the mouth of the Devils river, and the Rio Grande only in its course through the Coastal Plain. From its headwaters, 12,000 ft. above the sea, it rushes rapidly down a mountain canyon to San Luis Valley, in Colorado. It flows with moderate speed through this broad valley, enters a long canyon with a maximum depth of 400 ft., about 4 m. above the boundary between Colorado and New Mexico, and is hemmed in between canyon walls rising as high as 1000 ft. or between the sides of narrow mountain valleys throughout its course through New Mexico. It passes through a series of picturesque canyons, some of them 1750 ft. in depth, in the "Big Bend," and becomes a flat-lying stream with a shallow channel as it enters Tamaulipas, Mexico. In its passage through the Coastal Plain. Except in the flood season of May and June, the quantity of water which, for irrigation and by evaporation, is taken from the Rio Grande between its entrance to the San Luis Valley and the mouth of the Conchas, is greater than that received, and as a consequence it is an intermittent stream in this region. The flow of the Conchas is constant, and in the "Big Bend" the volume of the Rio Grande is enhanced by springs which break out in the bed. The total flow of the Rio Grande is ten times greater in some years than in others, and when its waters have been highest there have been great floods in its lower course and so much shifting of its banks as to cause international complications. Even in its course through the Coastal Plain its channel is so much obstructed by sand bars that it is of little importance for navigation. As the increasing diversion of the water of the Upper Rio Grande for irrigation in Colorado and New Mexico resulted in a scarcity of water for this purpose in the southern United States, and to remedy this evil the Reclamation Service of the United States proposed the construction by the United States of a storage dam across the river near Engle, New Mexico, which would form a storage reservoir having a capacity of 2,000,000 acre-feet and from which Mexico should be furnished with 60,000 acre-feet of water annually. Mexico agreed to this proposal and a treaty covering the matter was proclaimed in January 1907.

The principal towns and cities on the river are: Brownsville, Texas; Matamoros, Mexico; Laredo, Texas; El Paso, Texas; and Ciudad Juarez, Mexico.

RIO GRANDE DO SUL, a southern frontier state of Brazil, bounded N. by the state of Santa Catharina, E. by the Atlantic, S. by Uruguay and W. by Uruguay and Argentina—the Uruguay river forming the boundary line with the latter. Area, 91,333 sq. m. Pop. (1900) 1,149,070, an increase of 235,615 since 1894. The northern part of the state lies on the southern slopes of the elevated plateau extending southward from São Paulo across the states of Paraná and Santa Catharina, and is much broken by low mountain ranges whose general direction across the trend of the slope gives them the appearance of escarpments. A range of low mountains extends southward from the Serra do Mar of Santa Catharina and crosses the state into Uruguay. West of this range is a vast grassy plain devoted principally to stock-raising—the northern and most elevated part being suitable in pasture and climate for sheep, and the southern for cattle. East of it is a wide coastal zone only slightly elevated above the sea; within it are two great tide-water lakes—Lagão dos Patos and Lagão Mirim—which are separated from the ocean by two sandy, partially barren peninsulas. The coast is one great sand beach, broken only at one point—that of the outlet of the two lakes, called the Rio Grande, which affords an entrance to navigable inland waters and several ports. There are two
distinct river systems in Rio Grande do Sul—that of the eastern slope draining to the tide-water lakes, and that of the La Plata basin draining westward to the Uruguay. Fully one-third of the state belongs to the latter group. The larger rivers of the eastern group are the Jacuby, Sinos, Camaquam, Gravatahy and Camaquam, which flow into the Lagôa dos Patos, and the Jaguaro which flows into the Lagoa Mirim. All of the first named, except the Camaquam, discharge into one of the two arms or estuaries opening into the northern end of Lagôa dos Patos, which is called the Rio Guahyba, though in reality it is not a river. It is broad, comparatively deep and about 35 m. long, and with the rivers discharging into it affords upwards of 200 m. of fluvial navigation. The Jacuby is one of the most important rivers of the state, rising in the ranges of the Coxilha (Cuchilla) Grande of the North and flowing S. and S.E. to the Guahyba estuary, with a course of nearly 300 m. It has two large tributaries—the Vaccacahy from the S. and the Taquary from the N.—besides many small streams. The Jaguaro, which forms part of the boundary line with Uruguay, is navigable 26 m., up to and beyond the town of Jaguaro. Of the many streams flowing northward and westward to the Uruguay, the largest are the Itu, Guasu, of the plateau region, the Ibitocai, which has its source in the department of Santa Maria, and flows westward to the Uruguay a short distance above Uruguayana and the Quarahim, or Quarahy, which forms part of the boundary line with Uruguay. The Uruguay river itself is formed by the confluence of the Rio dos Canães and Rio Pelotas in about long. 51° 30’ W. With its southern confluent, the Rio Pelotas, which has its source in the Serra do Mar, on the Atlantic coast, it forms the northern and western boundary line of the state down to the mouth of the Quarahim, on the Uruguayan frontier. In addition to the Lagôa dos Patos and Lagoa Mirim there are a number of small lakes on the sandy, swampy peninsulas that lie between the coast and these two, and there are others of a similar character along the northern coast. The largest lake is the Lagôa dos Patos (Lake of the Patos—an Indian tribe inhabiting its shores at the time of the discovery), which lies parallel with the coast-line, N.E. and S.W., and is about 133 m. long exclusive of the two arms at its northern end, 25 and 35 m. long respectively, and 16 m. wide at the outlet, and rising 11 m. above the level of the sea. Its width varies from 12 to 26 m. The lake is comparatively shallow and filled with sand bottoms, making its navigable channels tortuous and difficult. The Lagoa Mirim occupies a similar position farther S., on the Uruguayan frontier, and is about 108 m. long by 6 to 22 m. wide. It is more irregular in outline and discharges into Lagôa dos Patos through a navigable channel known as the Rio São Gonçalo. A part of the lake lies in Uruguay, but its navigation, as determined by treaty, is exclusively to Brazil. Both of these lakes are evidently the remains of an ancient depression in the coast-line shut in by sand beaches built up by the combined action of wind and current. They are of the same level as the ocean, but their waters are affected by the tides and are brackish only a short distance above the Rio Grande outlet.

Rio Grande lies within the South Temperate zone and has a mild, temperate climate, except in the coastal zone where it is semi-tropical. There are only two well-marked seasons, though the transition periods between them (about two months each) are sometimes described as spring and autumn. The winter months, June to September, are characterized by heavy rains and by cold westerly winds, called mizanas, which sometimes lower the temperature to the freezing point. The spring is warm and sunny, but ice frequently forms on inland waters during cold winter nights, only to disappear with the first rays of the sun. In summer, which is nominally a dry season, light rains are common, northerly and easterly winds prevail, and the general atmosphere is clear and shade. Cases of insolation are not rare. Malaria is unusual and the state has a high reputation for healthiness, though insanitary conditions are responsible for various diseases in large communities.

The principal industry of the state is stock-raising, especially on the southern plains, where large estancias (anches) are to be found. This industry originated with the Jesuit missions on the Uruguay early in the 17th century, and its development here has been much the same as in Argentina and Uruguay. No general effort was made before the 20th century to improve the herds by the importation of better breeds, and the industry was practically in a state of decay until higher tariff rates were imposed on imported carne (beef) and mutton toward the end of the 19th century. The export of live-stock is insignificant, the practice being to sell the cattle to the xarqueiros or saladores where they are slaughtered for xarque chargui or carne seca, which is usually prepared by salting and smoking, and marketed chiefly in the other Brazilian states for consumption, while the hides and other by-products are exported to Europe and the United States. The importance of the industry is shown in the exports of 1905, in kilograms, viz.: jerks, 436,755,091; dry ox-tongues, 4,735,987; hides, 1,215,421; ox-tongues, 498,577; tallow, 6,174,189; and large quantities of leather, horns, hoofs, bone-ash and preserved meats. Horses, mules, sheep, goats and swine are also raised; the raising of sheep being fostered by the building of woollen factories, and that of swine by the importation of imported pork and lard. In some parts of the state agriculture claims much attention, especially in the forested districts of the north where colonies of foreign immigrants have been established. The principal products are Oat, Indian corn, rice, beans, peas, onions, garlic, farinha de mandioca (cassava flour), potatoes, tomatoes, cabbage, fruit, tobacco and peanuts—all of which find a ready market on the coast. Grapes are grown in several localities (São Lourenço do Sul, Viamão, and other small places), and the industry has become important—the export in 1905 being 2,092,417 litres. The forest products include herva mati or Paraguay tea (Ilex paraquayensis), timbers and lumber, and vegetable fibre (crin, agave, &c.)—the latter being a valuable source of cordage. There are other manufactures, chiefly paper and tobacco. The manufacture of paper is limited to Porto Alegre and the province of Rio Grande do Sul has become an important colony of Swiss and German immigrants. Tobacco manufacture is somewhat more important, and the industries of the suburbs include the manufacture of hosiery, shoes, and other small manufactures. The principal industries of the state, however, are woollen, cotton and jute textiles, leather, wheat, flour, boots, shoes and sandals (tamancos), wines and liquors, beer, macaroni, biscuits and other confectionery. The principal export to the United States is live and canned hogs, the two largest branches being bacon and salting. The state has entered for the second time into the woollen industry, and several factories are now manufacturing in the woollen, cotton, and jute textiles. The woollen industry is largely dependent on the export trade. The wooleens are sent to various parts of the United States, mainly to the eastern seaboard, and are used for the manufacture of clothing, homespun, and other purposes. The woollen industry is supported by the state, and the government of the state is actively interested in its development. The woollen industry is largely dependent on the export trade, and the state has entered for the second time into the woollen industry, and several factories are now manufacturing in the woollen, cotton, and jute textiles. The woollen industry is largely dependent on the export trade. The wooleens are sent to various parts of the United States, mainly to the eastern seaboard, and are used for the manufacture of clothing, homespun, and other purposes. The woollen industry is supported by the state, and the government of the state is actively interested in its development.

The population in 1900 was 1,149,070. There is a large foreign element: in 1905 the total number of foreigners residing in the state was estimated at 400,000 (not including children born in the country), and of Germans at 250,000. The first German colony was founded in 1824 and settled in 1825 in the rich forested country N. of Porto Alegre, and many large and prosperous communities have been established since then in spite of the wars and political agitations in the state. Several of these colonies, such as São Leopoldo, Novo Hamburgo and Conde d’Eu (now Garibaldi), have become important towns and have a large number of inhabitants. In 1850 the Italian colonies were subsequently established, also with good results, but an Irish colony founded at Monte Bonito, near Pelotas, about 1851, failed completely. The capital of Rio Grande do Sul is Porto Alegre at the northern extremity of Lagôa dos Patos, and its two next most important cities are Rio Grande and Pelotas, both at the southern extremity of the same lake. Among other important cities and towns, with population returns for 1900, are Alegre (11,438), prettily situated in the W., part of the state on the Porto Alegre to Uruguayana railway; Bagé (13,463), about 175 m. by rail N.W. of Rio Grande in a picturesque mountainous region, 202 ft. above sea-level; Jaguari (5,000), on a river of the same name and opposite the Uruguay town of Artigas, with steamboat communication with Rio Grande; Caçapava (7,001) in a fine grazing district in the central part of the state, 1,734 ft. above sea-level; Quaraí, or Quarahy (about 6,500), a town of much commercial...
importance on the Quaraí river opposite the Uruguayan town of Santo Eugenio, and surrounded by a rich grazing country which supports one of the largest saladeros in the state; São Leopoldo, Santa Maria da Boca do Monte; and Uruguayana. The territory was first settled along the Uruguay river by the Jesuits when they were compelled to abandon their missions on the upper Paraná. Between 1632 and 1707, they founded on the E. side of the Uruguay seven missions—all under Spanish jurisdiction—which became highly prosperous, and at the time of their transfer from Spanish to Portuguese rule by a treaty of 1750 had an aggregate population of about 14,000, living in villages and possessing large herds of cattle and many horses. A joint effort of the two powers in 1753 to enforce the treaty, remove the Indians to Spanish territory, and mark the boundary line, led to resistance and a three years' war, which ended in the capture and partial destruction of the missions. On the coast the first recognized settlement—a military post at Estreito, near the present city of Rio Grande—was made in 1737. Before this, and as early as 1680, according to some chroniclers, the region S. of Santa Catharina was occupied by settlements, or penal colonies, of desgradados (banished men) and immoral women from Santos, São Vicente and São Paulo, and was known as the 'Contínuo de São Pedro.' In 1738, the territory (which included the present S. portion of Santa Catharina province) became the Capitania d'El Rei and was made a dependency of Rio de Janeiro. Territorial disputes between Spain and Portugal led to the occupation by the Spanish of the town of Rio Grande (then the capital of the capitania) and neighbouring districts from 1763 to 1776, when they reverted to the Portuguese. The capture of Rio Grande in 1763 caused the removal of the seat of government to Viamão at the head of Lagôa dos Patos; in 1773 Porto dos Caesas, renamed Porto Alegre, became the capital. In 1801 news of war between Spain and Portugal led the inhabitants of Rio Grande to attack and capture the seven missions and some frontier posts held by the Spaniards since 1763; since 1801 the boundary lines established by treaty in 1777 have remained unchanged. The districts of Santa Catharina and Rio Grande had been separated in 1760 for military convenience, and in 1807 the latter was elevated to the category of a capitania-geral, with the designation of 'São Pedro do Rio Grande,' independent of Rio de Janeiro, and with Santa Catharina as a dependency. In 1812 Rio Grande and Santa Catharina were organized into two distinct comarcas, the latter becoming an independent province. The site of Rio Grande was not established until 1823. In 1835 a separatist revolution broke out in the province and lasted ten years. It was reduced more through the use of money and favours than by force of arms; but the province had suffered terribly in the struggle and did not recover its losses for many years. An incident in this contest was the enlistment of Garibaldi for a short time with the forces of the separatists. In 1865 a Paraguayan army invaded the state and on the 5th of August occupied the town of Uruguayana. On the 15th of September following, the Paraguayan general (Eti-garriba) surrendered without a fight—an unusual occurrence in the remarkable war that followed. Political agitation have been frequent in Rio Grande do Sul, whose people have something of the temperament of their Spanish neighbours, but no important revolution occurred after the 'ten years' war' (1835-45) until the presidency at Rio de Janeiro of General (Bomy) Esquivel, whose ill-considered interference with the state governments led to the revolt of 1892-94, under a home-grown revolutionary, Ribeiro Carvalho. In this struggle the revolutionists occupied Santa Catharina and Paraná, capturing Curiúva, but were eventually overcome through their inability to obtain munitions of war. An incident in this struggle was the death of Admiral Saldanha da Gama, one of the most brilliant officers of the Brazilian navy and one of the chiefs of the naval revolt of 1893-94, who was killed in a skirmish on the Uruguayan frontier at the close of the war.

RIO GRANDE DO SUL of São Pedro do Rio Grande do Sul (sometimes São Pedro and commonly Rio Grande), a city and port of the state of Rio Grande do Sul, Brazil, on the western side of the Rio Grande (as the outlet of the Lagôa dos Patos is called), about 6 m. from its mouth and nearly 780 m. S.W. of Rio de Janeiro, in lat. 3° 2' S., long. 52° 8' W. Pop. (1890) of the município (area, about 656 sq. m.), 24,653; of the city, including its suburbs, 20,193; (1900, estimate) of the city, 22,000, and of the city and its suburbs, 30,000. Rio Grande is the coast terminus of the Rio Grande to Bagé railway, which now forms part of the railway system of the state leased to the Belgian Compagnie Auxiliaire de Chemin de Fer au Brésil. Some of the principal streets are served by tramways, and the Rio Grande to Bagé railway has an extension to its shipping wharf called “Estação Marítima” (1½ m.), a branch to some points on the river (1½ m.), and a branch to Costa do Mar, on the ocean coast (1½ m.). The city is a port of call for several steamship lines, and has direct communication with European ports. The bar at the mouth of the river, however, restricts traffic to vessels of light draught, not exceeding 12 to 15 ft. Extensive improvements, at an estimated cost of about 133½ millions of dollars, were undertaken in 1908 for deepening the bar to admit vessels of 30 ft. draught.

The city is built on a low sandy peninsula, barely 5 ft. above sea-level, formed by two arms of the Rio Grande, projecting westward from the main channel, the peninsula being part of the large sandy, low land extending from the mouth of the Lagôa Mirim. The level of the plain is broken by ranges of sand dunes, some of which rise not far from the city on the south and south-east. The openness of the surrounding country and the proximity of the sea give to Rio Grande unusually healthy conditions, which, however, are largely counteracted by defective sanitary arrangements. Not infrequently the deaths exceed the births, and epidemics of contagious diseases make deadly inroads upon the population. The city has been developed irregularly, but the streets are for the most part broad, and the principal ones are well paved. Gas lighting was introduced about 1871, and in 1908 acetylene was used for public lighting. In one of the public squares is a shaft commemorating the abolition of slavery, and said to be the only monument in Brazil of that character. There is a notable scarcity of shade trees in the streets and squares, though flowers, shrubbery and some kinds of fruit trees are growing. In pleasing contrast to the drifting sands which surround the city is the fertile Ilha dos Marinheiros (Sailor's Island) lying directly in front of the port; it is highly cultivated and supplies the market with fruit, vegetables. The water-front has been improved by substantial stone walls, which permit the mooring of light-draught vessels alongside.

Among noteworthy public buildings and institutions are the municipal palace, the parochial church of São Pedro, dating from the 18th century, the modern church of N.S. de Bomfim, the beautiful Protestant Episcopal church (Gothic), the public hospital (Hospital de Graças), the hospital of the Beneficencia Portuguesa, the public library (Bibliotheca Rio-grandense), created and maintained by private effort and containing about 30,000 volumes, the old custom-house and the quartel-geral (military barracks). Rio Grande has a fine modern and spacious commercial city. Its exports include salted jerked beef (carne seca, or xarque), preserved meats, tongues, hides, horns, hoofs, woollen fabrics, Paraguayan tea, beans, onions, fruit, flour, farinha de mandioca (castava flour), lard, soap, candles and leather. Its manufactures include cotton, woolen and jute fabrics, wheat flour, biscuits, cigars and cut tobacco, beer, artificial drinks, boots, shoes and sandals (alpergatas), soap and candles, fire-works, ice, earthenware, hats, cast-iron and leather. The pioneer woollen factory in Brazil, and one of the largest in the country, is in Rio Grande.

Rio Grande was founded in 1737 by José da Silva Paes, who built a fort on the river near the site of the present city and called it Esteiro. In 1745 the garrison and settlement was removed by Gomes Freire d’Andrade to its present site, which became a “vila,” in 1751, with the name of São Pedro do Rio Grande, and a “cidade” (city) in 1807. It was the capital of the captnacy down to 1753, when it was captured by a Spanish force from Buenos Aires under the command of its governor, Don Pedro Zeballos, the seat of government being then removed to Viamão at the northern end of Lagôa dos
Rioja, a territory of Argentina lying between the Colorado river and the 42d parallel S. lat., within the geographical area formerly known as Patagonia, bounded N. by the territories of Neuquen and La Pampa, E. by the province of Buenos Aires and the Atlantic, S. by the territory of Chubut and W. by Chile and Neuquen. Area, about 75,942 sq. m.; pop. (1895) 9241; (1904, estimate) 18,648. That part of it lying between the Colorado and Negro rivers has much of the formation and characteristics of the "sterile pampas," but with irrigation the greater part of it can be utilized for agriculture and grazing. South of the Negro the country is arid, barren and lies in great shingle-covered terraces sloping eastward to the Atlantic; its larger part is practically uninhabitable, only the river valleys and the foot-hills of the Andes having a regular water supply. The rivers of the territory are the Colorado, which forms a part of its northern boundary, and the Negro, formed by the confluence of the Limay (which forms part of the western boundary) and Neuquen on the boundary between Rio Negro territory and the territory of Neuquen. These rivers have no tributaries of importance within the territory, but the Limay receives some small streams from the Andean slopes. Lake Nahuel-Huapi lies partly in this territory (see Neuquen), and there are several small lakes scattered over the shingly steppes. The Atlantic coast-line of the country has a military importance, but does not present no ports or towns upon it. The only industry of importance is grazing, cattle being raised for export to Chile, and a few sheep for their wool. The capital is Viedma (pop. in 1895, estimate, 1500), on the right bank of the Rio Negro, which is navigable up to the Neuquen frontier (about 450 m.), but the only place of importance is General Roca (about 2300), a military and supply station situated a few miles below the confluence of the Limay and Neuquen rivers and connected with Bahia Blanca and Buenos Aires by a branch of the Great Southern railway.

Rio Pardo (formerly Villa del Rio Pardo), a town of Brazil in the state of Rio Grande do Sul, on the left bank of the Jacuhy at its confluence with the Pardo. Area (of the municipality) 1737 sq. m. Pop. (1890) of the municipality, 19,346; (1908, estimated) of the town, 3500. The town is about 80 m. due west of Porto Alegre, with which it is connected by rail and steamer. The Jacuhy is navigable by small steamers to this place, which was once an important military station and commercial centre. Its military importance has considerably declined through railway extension. The surrounding districts are fertile but only slightly cultivated, and stock-raising is its chief industry. The town had its origin in a frontier fort built at this point by the Portuguese in 1751, but did not reach the dignity of a "vila" until 1809.

Riot (O. Fr. r.iol, of uncertain etymology), the gravest kind of breach of the peace, short of treason, known to the English law. It consists in a tumultuous disturbance of the peace by an assemblage of three or more persons who, with intent to help one another against any one who opposes them in the execution of some enterprise, actually execute that enterprise in a violent and turbulent manner, to the terror of the people. It is not necessary that violence should be used to any person or damage done to any property. Whether the enterprise itself is lawful or unlawful is not material, the gist of the offence lying in the mode in which the enterprise is carried out (The Trafalgar Square Riots, 1888, 16 Cox. Cr. Cas. 439, 437; Stephen, Dig. Crim. Law, 6th ed., art. 77). Nor is it material whether the enterprise is of a private or a public nature, though in the latter case the rioters may also be guilty of sedition or treason. An assembly in its inception perfectly lawful may become a riot if the persons assembled proceed to form and execute a common purpose in the manner above stated, although they had no such purpose when they first assembled. Riot differs from "Affray" in the number of persons necessary to constitute the offence, from an "Unlawful Assembly" in that actual tumult or violence is an
RIOT

essential element, and from “Rout,” which may be described as a beginning or endeavour to create a riot. It was considered as early as the 14th century that the English common law gave an insufficient remedy against riot. In 1360 the statute of 34 Edward III. gave jurisdiction to justices to restrain, arrest and imprison rioters. In 1393 the statute of 17 Richard II. conferred similar powers on the sheriff and his trovatis. Numerous other acts extending the common law were passed, especially in the Tudor reigns (see Stephen, History of the Criminal Law, vol. 1, p. 202). Both these acts above mentioned are still on the statute book, but the earliest act now in force of real importance is that to which this exposition is the Riot Act (1716), which creates certain statutory offences for riot attended by circumstances of aggravation. That act makes it the duty of a justice, sheriff, mayor or other authority, wherever two persons or more are unlawfully, riotously and tumultuously assembled together, to the disturbance of the public peace, to resort to the place of such assembly and read the following proclamation: “Our Sovereign Lord the King chargeth and commandeth all persons being assembled immediately to disperse themselves, and peaceably to depart to their habitations or to their lawful business, upon the pains contained in the act made in the first year of King George for preventing tumultuous and riotous assemblies. It is a felony to obstruct the reading of the proclamation or to remain or continue together unlawfully, riotously and tumultuously for one hour after the proclamation was made or for one hour after it would have been made but for being hindered. The act requires the justices to seize and apprehend all persons continuing after the hour, and indemnifies them and those who act under their authority from liability for injuries caused thereby. The punishment for the felony is a fine of five pounds for life or for a term of not less than three years, or imprisonment with or without hard labour for not more than two years. Prosecutions for an offence against the act must be commenced within twelve months after the offence.”

By s. 12 of the Malicious Damage Act 1861 (which is a re-enactment of a similar provision made in 1827 in consequence of the frame-breaking riots), it is a felony for persons riotously and tumultuously assembled together to the disturbance of the public peace to unlawfully and with force demolish or begin to demolish or pull down or destroy any building, public building, machinery or mining plant. The punishment is the same as for a felony under the Riot Act. By s. 12 it is a misdemeanour to injure or damage such building, &c., The punishment is penal servitude from three to seven years, or imprisonment as in the case of the two felonies above described. Under the Shipping Offences Act 1973 (a riotous assembly of three or more seamen, ship's carpenters and other persons, unlawfully and with force preventing and hindering or obstructing the loading or unloading or the sailing or navigation of any vessel, or unlawfully and with force boarding any vessel with intent to prevent, &c., is punishable on a first conviction as a misdemeanour by imprisonment from six to twelve months, and on a second conviction as a felony by penal servitude from three to fourteen years. And under the Offences against the Person Act 1861 (s. 40) summary penalties are provided for forcible interference with seamen in the exercise of their lawful occupation.

Besides these enactments there are others aimed at similar offences, such as smuggling, forcible entry and detention, tumultuous petitioning (1661, 13 Charles II.), holding large political meetings within a certain distance of Westminster Hall during the sitting of parliament (Seditious Meetings Act 1817). For these offences see Stephen, Dig. Cr. Law, 6th ed., arts. 81-87.

It is the duty of a magistrate at the time of a riot to assemble subjects of the realm, whether civil or military, for the purpose of quelling the riot. In this duty he is aided by the common law, and a statute of 1414 (Henry V.), under which all subjects of the realm are bound to assist on reasonable warning, and by various enactments enabling the authorities to call out the militia, yeomanry and reserve forces for the suppression of riot, and to close public-houses where a riot is apprehended (Licensing Act 1872). It is his duty to keep the peace; if the peace be broken, honesty of intention will not avail him if he has been guilty of neglect of duty. The question is whether he did all that he knew was in his power and which could be expected from a man of ordinary prudence, firmness and activity. The law as thus stated is gathered from the opinions of the judges on the trials of the lord mayor of London and the mayor of Bristol on indictments for neglect of duty at the time of the Gordon riots of 1780 and the Bristol riots in 1831. In addition to his liability to an indictment at common law, a defaulting magistrate is subject under the provisions of acts of 1411 (Henry IV.) and 1414 (Henry V.) to a penalty of £10 for every default, the default to be inquired of by commission under the great seal. A matter of interest is the extent of the protection afforded by the Riot Act to soldiers acting under the commands of their officers. The question was dealt with by Lord Bowen and his fellow-commissioners in the report on the Featherstone riots ( Parl. Paper, 1893-1894, c. 7234). The substance of their views is as follows:—

By the law of England every one is bound to aid in the suppression of riotous assemblages. The degree of force, however, which may be lawfully employed in their suppression depends on the nature of the riot for the force used must always be moderated and proportioned to the circumstances of the case and to the end to be attained. The taking of life can only be justified by the necessity for protecting persons or property against various forms of violent crime, or by the necessity of dispersing a riotuous crowd which is dangerous unless dispersed, or in the case of persons whose conduct has become felonious through disobedience to the provisions of the Riot Act, and who resist the attempt to disperse or apprehend them. The necessary prevention of such outrage on person or property justifies the guardians of the peace in the employment against a crowd of even deadly weapons. Officers and soldiers are under no special privileges and subject to no special responsibilities as regards the principle of the law. A soldier for the purpose of establishing civil order is only a citizen armed in a particular manner. He cannot, however, be exonerated if without necessity he takes human life. The duty of magistrates and peace officers to summon or abstain from summoning the assistance of the military depends in like manner on the necessities of the case. A soldier can act only by using his arms. The weapons he carries are deadly. They cannot be used without danger to life or limb, and in these days of improved Annie in arms there is some risk of danger to distant and possibly innocent bystanders. To call for assistance against rioters from those who can interfere only under such grave conditions ought, of course, to be the last expedient of the civil authorities. But when the call for help is made and a necessity for assistance from the military has arisen, to refuse such assistance is in law a misdemeanour. The whole action of the military when once called in ought from first to last to be based on the principle of doing, and doing without fear, that is absolutely necessary to prevent serious crime, and of exercising care and skill with regard to what is done. No set of rules exists which governs every instance or defines beforehand any contingency that may arise. The presence of a magistrate is not essential, but is usual, and of the highest value to aid the commander of the troops by local knowledge. But his presence or absence has no legal effect on the duties or responsibilities of the military to use their arms when it becomes necessary to do so, and without recklessness or negligence and with reasonable care and caution; and where they have so acted the killing of a rioter is justifiable homicide, and the killing of an innocent bystander is homicide by misadventure. It is not usual to resort to extremities with rioters until after reading the proclamation under the Riot Act (1776), etc.

1 Reports of these trials will be found in the State Trials, New Series, vol. iii. pp. 1, 11. Most of the important cases of riot are collected or referred to in that series.
but this preliminary is by no means a condition precedent to the exercise of the common-law powers of suppressing riots.

The crown cannot charge upon the local rates the expense of maintaining soldiers called into a district by the magistrates to suppress a riot (re Glamorgan County Council, L.R. 1899, 2 Q.B. 350); but the cost of extra police drafted in for the like purpose falls on the rates of the district into which they are drafted (see Police Act 1890, s. 25). Until 1886 persons whose property was damaged by riot had a civil remedy of an exceptional character by action against the hundred in which the riot took place. This remedy was a survival of the pre-Conquest liability of the hundred to guarantee the orderly conduct of its inhabitants. The hundred was made liable in case of robbery by the Statute of Winchester (1285). That and subsequent acts were repealed in the reign of George IV., and their provisions were consolidated by an act of 1827 which gave a remedy against the hundred in the case of felonious demolition of churches, chapels, houses, machinery, &c., being feloniously demolished by rioters. The last instance of the use of this exceptional remedy was in the case of a riot at Worthing, and the remedy was abolished in 1896. When the Police Act 1897 was passed it was made an offence to fix or move movable property in such a manner as to obstruct or endanger the safety of the public or the lawful authority. If an injured shop or house is affected in the course of the riot, then a claim may be made against the police, whether the damage is done by the police or not.

In India the offence of riot, as defined by s. 146 of the Penal Code, consists in the use of force or violence by an unlawful assembly (which must consist of at least five persons, s. 141), or by any member thereof in the prosecution of the common object of such assembly (see Mayne, Ind. Criminal Law, ed. 1896, p. 489). In Ceylon and the Straits Settlements provisions based on the Indian Code are in force. In most of the settled Colonies the English law as to riot applies subject to local legislation. The Criminal Codes of Canada (1892, ss. 79–86), New Zealand (1893, ss. 83–89) and Queensland (1899, ss. 61–67) adopt the substance of the English law as to riot, in terms borrowed from the English draft Code of 1885. In those of the West Indies whose common law is based on that of France, Holland or Spain, the English law as to riot has been applied by ordinance, e.g., in British Guiana (Criminal Code 1893, tit. xix.), and St Lucia (Criminal Code 1888, tit. xxv.). In the South African colonies the English law of riot does not apply, but under the Dutch Roman law there exists a similar offence, known as “public violence” (ris publica), i.e., the taking or possession of a town or fort by which the public rest and order is endangered and the authority of the lawful authorities and officials is set at naught. The offence was (see Van Leeuwen, Roman-Dutch Law, tr. by Kotze, 1885, vol. ii. p. 204; Morice, English and Roman-Dutch Law, 1903, p. 334). Similar provisions based on the French Penal Code are in force in Mauritius (Penal Code of 1838).

The Riot Act does not extend to Ireland, but similar provisions are contained in an act of the Irish Parliament passed in 1879, amended by acts of 1882 and 1892. These acts create a special offence punishable by penal servitude for life, viz., sending notices, letters or messages inciting or tending to riot. Under the Criminal Procedure Ireland Act 1887 (a temporary act) summary proceedings may be taken against rioters. The civil remedy against the county or borough for malicious injury to property, real or personal, including ships in distress and their cargo, is wider than in England or Scotland, but it includes malicious injury by rioters where the injury is a crime within the Malicious Damage Act of 1861. Claims are now dealt with in the county court, and not as formerly by the grand jury and judge of assize (Local Government Ireland Act 1898, s. 5).

In Scotland a riot may be either “rioting and mobbing” or “rioting and breach of the peace.” The first is much the same as riot in English law. Mobbing consists in the assembling of a number of people and then combining against order or peace to the alarm of the lieges (Alison, Cr. Law of Scotland, vol. i. p. 509; Macdonald, Criminal Law, 180). The second offence occurs when concourse or a common purpose are wanting. Numerous acts against rioting and unlawful conviction were passed by the Scottish parliament, beginning in 1487. The Riot Act (1716) applies to Scotland. There is a civil remedy against the county or burgh in which a riot takes place in respect of damage done by the rioters to houses, churches, buildings and ships, and buildings or engines used in trade or manufacture. The remedy is given by a series of statutes of 1716, 1812, 1816, 1817 and 1894. The procedure for its enforcement is now regulated by the Riotous Assemblies (Scotland) Act 1822, and amending statutes. The county or the burgh authorities may adjourn suits without litigation, and pay them out of general revenue.

British Dominions.—In India the offence of riot, as defined by s. 146 of the Penal Code, consists in the use of force or violence by an unlawful assembly (which must consist of at least five persons, s. 141), or by any member thereof in the prosecution of the common object of such assembly (see Mayne, Ind. Criminal Law, ed. 1896, p. 489). In Ceylon and the Straits Settlements provisions based on the Indian Code are in force. In most of the settled Colonies the English law as to riot applies subject to local legislation. The Criminal Codes of Canada (1892, ss. 79–86), New Zealand (1893, ss. 83–89) and Queensland (1899, ss. 61–67) adopt the substance of the English law as to riot, in terms borrowed from the English draft Code of 1885. In those of the West Indies whose common law is based on that of France, Holland or Spain, the English law as to riot has been applied by ordinance, e.g., in British Guiana (Criminal Code 1893, tit. xix.), and St Lucia (Criminal Code 1888, tit. xxv.). In the South African colonies the English law of riot does not apply, but under the Dutch Roman law there exists a similar offence, known as “public violence” (ris publica), i.e., the taking or possession of a town or fort by which the public rest and order is endangered and the authority of the lawful authorities and officials is set at naught. The offence was (see Van Leeuwen, Roman-Dutch Law, tr. by Kotze, 1885, vol. ii. p. 204; Morice, English and Roman-Dutch Law, 1903, p. 334). Similar provisions based on the French Penal Code are in force in Mauritius (Penal Code of 1838).

United States.—In the United States the law is based upon that of England (see Bishop, Amer. Cr. L., 8th ed., 1892, vol. i. s. 534, vol. ii. ss. 1143 et seq.). In some states there is a statutory proclamation for the dispersion of rioters in terms almost identical with those of the British Riot Act. The city, town, or county is by the statutes of many states rendered liable for damage caused by rioters, with or without a remedy over against the persons who did the damage (see revised Laws of Massachusetts, ed. 1902, chap. 211, sects. 2, 8).

RIO TINTO (MINAS DE RIO TINTO), a mining town of southwestern Spain, in the province of Huelva; near the source of the river Tinto, and at the terminus of a light railway from the Po
cites.

RIO TINTO is one of the greatest copper-mining centres in the world; and it is from the discolouration of its waters by copper ore that the river derives its name. Besides the town of Minas, several villages are peopled by the native miners, whose numbers exceed 10,000; and one is occupied solely by British mine officials. The surrounding country is covered for miles with heaths of slag, and has been reduced to a desert. In 1903 the output of the mines included 840,000 tons of copper ore, worth more than £500,000, besides a relatively small quantity of iron and manganese. Almost the entire product is despatched to Huelva for shipment to Great

Footnote 1: There is a curious exception still on the Statute-book depriving persons robbed while travelling on the Lord's Day of any right to compensation from the hundred (Lord's Day Act 1677, s. 5).
RIOU—RIPON, 1ST MARQUESS OF

Britain. Rio Tinto was probably first exploited by the Carthaginians; vestiges of later Roman workings may still be seen. After the Moorish conquest, in 711, it was neglected until 1725, when the mine was leased to a Spanish named Wolters. Their modern importance dates from 1872, when a syndicate of London and Bremen capitalists purchased them from the Spanish government for nearly £4,000,000.

RIOU, EDWARD (1758 ?-1801), British sailor, entered the navy at an early age. In 1780 he was promoted lieutenant, and nine years later he was in command of the "Guardian," when that vessel, crowded with convicts, struck a hidden rock off the African coast. Riou, after putting with as many of his men as the boats would hold, not only successfully navigated his half-sinking ship 400 leagues to the Cape of Good Hope, but kept order amongst the panic-stricken convicts, an achievement which had few parallels in naval annals, and won Lieutenant Riou's immediate promotion. He did not long remain a commander and in 1791 he was posted. Under Sir John Jervis he was present at the operations about Martinique and Guadeloupe in 1794, and in the "Amazon" he accompanied the expedition under Sir Hyde Parker to the Baltic in 1807. His frigate led the way through the Channels and the Cape of Good Hope in the battle he was attached as commodore of a light squadron to Nelson's division.

Through the grounding of three ships of the line, Riou and his frigates found themselves opposed to the full force of the great Trekroner battery. Early in the fight he was wounded, but refused to leave the deck, and, as he was sitting on a gun-carriage and directing his men's fire, he was cut in two by a cannon ball. Nelson, who had not known him before this expedition, had conceived a great affection for Riou, and spoke of his loss as "irreparable." Breston, the naval historian, declared that he had all the qualities of a perfect officer. Parliament commemorated the memory of the "gallant good Riou" by a memorial in St. Paul's Cathedral.

RIOUW, RIOUW or BITANG, an archipelago of the Dutch East Indies, E. of Sumatra, and separated from the Malay Peninsula by the Straits of Singapore. With the Lingga, Karimun, Tambelan, Anambas islands west to Java E. and S., and the territory of Indragiri in Sumatra, it forms the Dutch residency of Riouw and dependencies. The seat of government is at Tanjong Pinang, a small port of 4000 inhabitants (including 160 Europeans and about 2000 Chinese), on the S.W. coast of the chief island, Bintang or Riouw. The total area of the residency is about 17,550 sq. m., and its population (1905) 112,216, of whom considerably over a quarter are Chinese. These cultivate gambier and pepper successfully in Bintang, and there is a considerable trade in wood. Bintang has an area of about 440 sq. m., and is surrounded by many rocks and small islands, making navigation dangerous. The soil is not fertile, and much of it is swampy. There is an assistant residency of Lingga, to which belongs the island of Singkeng, where extensive tin-deposits are worked. Geologically the Riouw and Lingga Islands are appendages of the Malay Peninsula, not of Sumatra. Bintang is mentioned by Marco Polo under the name of Pitenom, which is derived from the genuine Malay Bintang, so as to mean a half-moon. After the Portuguese conquest of Malacca (1511), the expelled Mahommedan dynasty took up its residence on Bintang, where it long fostered piracy.

RIPEY, GEORGE (1802-1880), American critic and man of letters, was born at Greenfield, Massachusetts, on the 3rd of October 1802. He graduated first in his class at Harvard in 1823. From 1826 to 1840 he was pastor of a Unitarian church in Boston, subsequently retiring from the active ministry altogether. It was during those years that there grew up in New England that form of thought or philosophy known as Transcendentalism. Ripley was prominent, if not the leader, in all practical manifestations of the movement; and it was largely by his earnestness and practical energy that certain of its more tangible results were brought about. The first meeting of the Transcendental Club was held at his house in September 1836. He was a founder and a chief supporter of the magazine, *The Dial*, which was the organ of the school from 1841 to 1844. Most important of all, however, he was the originator of "The Brook Farm Institute of Education and Agriculture." Until the abandonment of this experiment in 1847, Ripley was its leader, cheerfully taking upon himself all kinds of tasks, teaching mathematics and philosophy in the school, milking cows and attending to other bucolic duties, and after June 1845 editing the weekly *Harbinger*, an organ of "association," which he continued to edit in New York from 1847 until it was discontinued in 1849. The failure of Brook Farm (q.v.) left Ripley poor and feeling keenly the defeat of his project; but the event forced him at last to devote himself to that career of literary labour in which the real success of his life was achieved. In 1849 he joined the staff of the New York *Tribune*, and in a short time became its literary editor. This position, which, through his steadiness, scholarly conservatism and freedom from caprice as a critic, soon became one of great influence, he held until his death in New York City on the 4th of July 1880.

During the greater part of the time of his connexion with the *Tribune*, Ripley was also an adviser of a prominent publishing house, an occasional contributor to the magazines, and a co-operator in several literary undertakings. The chief of these was the *American Cyclopedia*, known as the American *Cyclopaedia*—so named to distinguish it from Francis Lieber's *Encyclopaedia Americana*—was issued, under the editorship of Ripley and Charles A. Dana, in 1857-63, a revised edition, with the word "new" dropped from the title, being issued under the same editorship in 1873-76. He also issued, in translation, a series of *Specimens of Foreign Standard Literature* (14 vols., 1838-42). Ripley was twice married, first in 1827 to Miss Sophia Willard Dana (d. 1861), a daughter of Francis Dana and a conspicuous figure at Brook Farm; and second, in 1865, to a young German widow, Mrs August Schlossberg, who survived him and subsequently married Alphonse Pinede.

A biography of Ripley (Boston, 1882), written by the Rev. O. B. Frothingham, forms one of the volumes of the "American Men of Letters" series. (E. L. B.)

RIPLEY, a market town in the Ilkeston parliamentary division of Derbyshire, England, 10 m. N. by E. of Derby, on a branch of the Midland railway. Pop. of urban district (1901) 10,111. It lies on high ground between the valleys of the Derwent and the Erewash. In the neighbourhood there are extensive collieries, and coke is largely manufactured. Besides iron foundries, blast furnaces and boiler works, the town possesses silk and cotton mills. The charter for the market was granted by Henry III. The district has a large industrial population. To the west of Ripley lies the township of Heage (pop. 2889).

RIPON, GEORGE FREDERICK SAMUEL ROBINSON, 1ST MARQUESS OF (1827-1909), British statesman, only son of the 1st earl of Ripon and his wife Lady Sarah, daughter of Robert Hobart, 4th earl of Buckinghamshire, was born in London on the 24th of October 1827. The Robinson family was descended from an eminent Hamburg merchant, William Robinson (1522-1586), who represented York in parliament in Elizabeth's reign. His great-grandfather was created a baronet. Thomas Robinson, 1st Baron Grantham (1695-1770), son of a later holder of the baronetcy, was created a peer in 1761, having been an indefatigable diplomatist plenipotentiary at the peace of Aix-la-Chapelle, and secretary of state. The 2nd Baron Grantham (1738-1780), ambassador at Madrid, and foreign secretary under Lord Shelburne, had two sons. The elder of these, succeeding as 3rd Baron Grantham (1781-1859), became in 1833 2nd Earl de Grey, in right of his maternal aunt, and assumed the surname of de Grey; he was lord-lieutenant of Ireland (1841-44). The younger, Frederick John (1782-1859), created Viscount Goderich in 1827 and earl of Ripon in 1833, was the well-known "Prosperity Robinson" who was chancellor of the exchequer from 1823 to 1827; as Lord Goderich he became prime minister (and a peculiarly weak one) from August 1827 to January 1828, colonial secretary in 1831 and 1832, lord privy
 Ripon, a cathedral city and municipal borough in the Ripon parliamentary division of the West Riding of Yorkshire, England, 214 m. N.N.W. from London, on the North-Eastern railway. (Pop. 1901) 8230. It is pleasantly situated at the confluence of the streams Laver and Skell with the river Ure, which is crossed by a fine bridge of nine arches. The streets are for the most part narrow and irregular, and, although most of the houses are comparatively modern, some of them retain the picturesque gables characteristic of earlier times. The cathedral, although not ranking among those of the first class, is celebrated for its fine proportions, and is of great interest from the various styles of architecture which it includes. Its entire length from E. to W. is 266 ft., the length of the transepts 130 ft., and the width of the nave and aisles 87 ft. Besides a large square central tower, there are two western towers. The cathedral was founded on the ruins of St Wilfrid's abbey about 680, but of this Saxon building nothing now remains except the crypt, called St Wilfrid's Needle. The present building was begun by Archbishop Roger (1154–81), and to this transition period belong the transepts and portions of the choir. The western front and towers, the fine spire of English, were probably the work of Walter de Grey, archbishop of York (d. 1255), and about the close of the century the eastern portion of the choir was rebuilt in the Decorated style. The nave, portions of the central tower, and two bays of the choir are Perpendicular, having been rebuilt towards the close of the 15th century. Earlier than the rest of the fabric (except the crypt) is part of the chapter-house and the vestry, adjoining the south side of the choir, and terminating eastward in an apse. This is pure Norman work, and there is a crypt of that period beneath, which was formerly filled with unburied bones. There are a number of monuments of historical and antiquarian interest. The diocese includes rather less than one-third of the parishes of Yorkshire, and also a small part of Lancashire. The bishop's palace, a modern building in Tudor style, is situated in extensive grounds about a mile from the town. In the vicinity is the domain of Studley Royal, the seat of the marquess of Ripon, which contains the celebrated ruins of Fountains Abbey (q.v.). The principal secular buildings are Hallam, the college of the secular canons, and the mechanics' institution (1864) where tenement houses and other secondary schools are held. There are several old charities, including the hospital of St. Wilfrid, which was founded in 1109 but modernized; the hospital of St Anne, founded probably in the reign of Henry VI. by an unknown benefactor; and the hospital of St Mary Magdalen for women. This last was founded by Thurstan, archbishop of York (1114–41), as a secular community, one of the special duties of which was to minister to lepers. In the 13th century a master and chaplain took the place of the lay brethren, and in 1334 a chantry was founded. The chapel remains, with its interesting Norman work, its low side-windows, said to have allowed the lepers to follow the services, and its pre-Reformation altar of stone, a rare example. There is a considerable trade in yarn, and the saddle-trees and other leather goods produced here are in high repute. The borough is under a mayor, 4 aldermen, and 12 councillors. Area, 1809 acres.

Ripon (In Rhyn, Ad Ripam) owed its origin to the monastery founded in the 7th century. A certain king, Alchfrith, is said to have given the site of the town to Eata, abbot of Melrose, to found a monastery, but before it was completed Eata was burned for refusing to celebrate Easter according to the Roman usage, and St Wilfrid was appointed the first abbot. Another version of the story, however, says that the land was given to St Wilfrid, who himself built the monastery. Ripon is said to have been made a royal borough by Alfred the Great, and King Ethelstan, after his victory at Brunanburh.
in 937, is stated to have granted to the monastery sanctuary, freedom from toll and taxes, and the privilege of holding a court, although both charters attributed to him are known to be spurious. At the same time he is said to have given the manor to Wulfstan, archbishop of York. About 950 the monastery and town were destroyed by King Edred during his expedition against the Danes, but the monastery was rebuilt by the archbishops of York, and about the time of the Conquest was changed to a collegiate church. In 1318, when the Scots invaded England, Ripon only escaped being burnt a second time by the payment of 1000 marks. The custom of blowing the wakeman’s horn every night at nine o’clock is said to have originated about A.D. 700. It was probably at first a means of calling the people together in case of a sudden invasion, but was afterwards a signal for setting the watch. A horn with a baldric and the motto “Except the Lord keep the city the watchman waketh but in vain” forms the mayor’s badge. The archbishops of York as lords of the manor had various privileges in the town, among which were the right of holding a market and fair, and Archbishop John, being summoned in the reign of Henry I. to answer by what right he claimed these privileges, said that he held them by prescription and by the charter of King Æthelstan. Henry I. afterwards granted or confirmed to Archbishop Thomas a fair on the feast of St. Wilfrid and four following days. The fairs and markets belonged to the archbishops of York until they were transferred to the bishop of Ripon in 1357. In 1857 they were transferred to the corporation of Ripon. From then on the Conquest until the incorporation charter of 1604 Ripon was governed by a wakeman and 12 elders, or aldermen, but in 1604 the title of wakeman was changed to mayor, and 12 aldermen and 24 common councilmen were appointed. The manufacture of cloth was at one time carried on in Ripon, but was almost lost in the 16th century when the town was visited by Leland. The making of spurs succeeded the cloth manufacture and became so noted that the saying “as true as Ripon rowels” was a well-known proverb. This manufacture died out in the 18th century. Ripon was summoned to send two members to parliament in 1295, and occasionally from that time until 1328–29. The privilege was revived in 1553, after which the burgesses continued to send two members until 1867, when they were allowed only one. This latter privilege was taken away by the Redistribution Bill of 1885, and it now gives its name to one of the divisions of the county.

See Victoria County History, Yorkshire; and W. Harrison, Ripon Mayor: A Pictorial Record of the Progress of the Town, arranged under its Wakens and Mayors from the year 1400 (1892).

RIPON, a city of Fond du Lac county, Wisconsin, U.S.A., on Silver Creek, about 22 m. W. of Fond du Lac, and about 75 m. N.W. of Milwaukee. Pop. (1890) 3,518; (1900) 3,818, of whom 885 were foreign-born; (1905) 3,821; (1910) 3,720. Ripon is served by the Chicago & North-Western, and the Chicago, Milwaukee & St. Paul railways. The city has a Carnegie library, which also houses the library of the Ripon Historical Society, and is the seat of Ripon College (non-sectarian, co-educational), which was founded in 1850 as the Lyceum of Ripon, and was named Ripon College in 1864; in 1908 it had 23 instructors and 279 students. There are grain elevators and various manufactories, among the products of which are cheese and other creamery products, flour, knit goods, pickles and canned goods, woodenware, washing machines and gloves.

The site of Ripon was purchased in 1838 by John Scott Horner (1802–1883), of Virginia, secretary and acting-governor of Michigan Territory in 1835, and the first secretary of Wisconsin Territory in 1836–37, who named the village when it was established in 1843 from the seat of his ancestors in Yorkshire. In May 1844 a settlement, named Ceresco or “the Wisconsin Phalanx,” a Fourierist community, organized.

The charter, granted by the legislature in 1845, contained the following features: (1) property to be held in common; in Southport (now Kenosha), had been established in the vicinity. A “Long House,” 400 ft. in length, was erected, which contained tenements, an amusement or lecture hall, and a dining-room where all ate at a common table, and where the members were paid a fixed salary, and there were three meals per week. The “class of usefulness” was divided into three groups, agricultural, mechanical and educational, with such subdivisions as necessity dictated, and an exact account of labour was kept. The community prospered materially from the start. In the second season it consisted of thirty families with property valued at $27,735; in 1846 there were 180 resident members, and the net profit for the year was $929. Eventually differences of opinion arose as to the division of labour, and the common dining-hall did not prove popular. Rivalry developed with the village of Ripon, and the community gave up its charter at the close of 1850, dividing property valued at $40,000 among the shareholders. On the whole it was one of the most successful experiments in communism ever tried in America. In 1858 Ripon absorbed the village of Ceresco and was chartered as a city. At Ripon started one of the disconnected movements that resulted in the founding of the Republican party.

See D. P. Mapes, History of Ripon (Milwaukee, Wis., 1873): Consul W. Butterfield, History of Fond du Lac County (1880); W. A. B. Street, American Communities and Co-operative Colonies (3rd ed., Chicago, 1908), and F. A. Flower, History of the Republican Party (1884).

RIPPERDA, JOHN WILLIAM, BARON, and afterwards duke of (1680–1737), political adventurer and Spanish minister, was a native of Groningen in the Netherlands. According to a story which he himself set going during his adventures in Spain, his family was of Spanish origin. But there does not appear to be any foundation for this assertion. The name was not uncommon in Groningen, and was borne by several persons of some note in the 16th and 17th centuries, one of whom was a follower of William the Silent. They were people of some position, possessing “lordships” at Jansnia, Poëlgast, and other places, and some at least of them were Roman Catholics. John William, if he was, as he asserted, born a Roman Catholic, conformed to Dutch Calvinism in order to obtain his election as delegate to the states-general from Groningen. In 1715 he was sent by the Dutch government as ambassador to Madrid. Saint-Simon says that his character for probity was even then considered doubtful. The fortune of Orry, Alberoni and other foreigners in Spain, showed that the court of Philip V. offered a career to adventurers. Ripperda—whose name is commonly spelt Ripperda by the Spaniards—devoted himself to the Spanish government, and professed himself a Roman Catholic. He first attached himself to the court of Philip, and after the fall of the minister he became the agent of Elizabeth Farnese, the restless and intriguing wife of Philip V. Though perfectly unscrupulous in money matters and of a singularly vain and blistering disposition, he did understand commercial questions, and he has the merit of having pointed out that the poverty of Spain was mainly due to the neglect of its agriculture. But his fortune was not due to any service of a useful kind he rendered his masters. He rose by undertaking to aid the queen, whose influence over her husband was boundless, in her schemes for securing the succession to Parma, Plasencia and Tuscany for her sons. Ripperda was sent as special envoy to Vienna in 1725. He behaved with ridiculous violence, but the Austrian government, which was under the influence of its own fixed idea, treated him seriously. The result of ten months of very strange diplomacy was a treaty by which the emperor promised very little, but and shares to be sold at $25; (2) land to be limited to 40 acres for each member of the corporation; (3) a unanimous vote of the managers necessary for admission; (4) an annual settlement of profits on the basis of one-quarter credit to dividend on stock, and three-quarters credit to labour; (5) free public schools, capital paying three-quarters and labour one-quarter of cost; and (6) complete religious toleration and no involuntary taxation for church support.
Spain was bound to pay heavy subsidies, which its exhausted treasury was quite unable to afford. The emperor hoped to obtain more. Elizabeth Fairlie hoped to secure the Italian duchies for her sons, and some vague stipulations were made that Charles VI. should give his aid for the recovery by Spain of Gibraltar and Minorca. When Ripperda returned to Madrid at the close of 1725 he asserted that the emperor expected him to be made prime minister. The Spanish sovereigns, who were overawed by this quite unfounded assertion, allowed him to grasp the most important posts under the crown. He excited the violent hostility of the Spaniards, and entered into a complication of intrigues with the French and English governments. His career was short. In 1726 the Austrian envoy, who had vainly pressed for the payment of the promised subsidies, came to an explanation with the Spanish sovereigns. It was discovered that Ripperda had not only made promises that he was not authorized to make, but had misappropriated large sums of money. The sovereigns who had made him duke and grandee shrank from covering themselves with ridicule by revealing the way in which they had been deceived. Ripperda was dismissed with the promise of a pension. Being in terror of the hatred of the Spaniards, he took refuge in the English embassy. To secure the favour of the English envoy, Colonel William Stanhope, afterwards Lord Harrington, he betrayed the secrets of his government. Stanhope could not protect him, and he was sent as a prisoner to the castle of Segovia. In 1728 he was dismissed with the connivance of the government, and made his way to Holland. His last years are obscure. It is said that he reverted to Protestantism, and went to Morocco, where he became a Mahomedan and commanded the Moors in an unsuccessful attack on Ceuta. But this story is founded on his so-called Memoirs, which are in fact a Grubstreet tale of adventure published at Amsterdam in 1740. All that is really known is that he did go to Morocco, and that he died at Tetuan in 1737.

See Arnold Ritter von Arnenth, Prinz Eugen von Savoyen (Vienna, 1864), for the negotiations of 1725, and Gabriel Svyeton, Une Cour et un aventurier au XVIIIe siecle (Paris, 1886). His Memoirs were translated into English by J. Campbell, London, 1750.

RISHANGER, WILLIAM (c. 1250–c. 1312), English chronicler, made his profession as a Benedictine at St. Alban’s abbey in 1271, of which he perhaps became the official chronicler. The most important of his writings is the Narratio de bellis apud Lewes et Evesham, written in aezs years afterwards and drawn from other sources, it is a spirited account of the barons’ war. He is so great an admirer of Simon de Montfort that this work has been called a hagiography. He is credited with the authorship of a chronicle covering the period 1250–1306; this has been disputed, but the work is printed under his name by Riley. Another work of his, of not much importance, is a chronicle entitled Recapitulatus brevis de gestis domini Edvardi, &c. He is probably not the author of other works commonly attributed to him.

RISK, hazard, chance of danger or loss, especially the chance of loss to property or goods which an insurance company undertakes to make good to the insurer in return for the recurrent payment of a sum called the premium (see Insurance). The word appears late in English, and in the 17th century in the Fr. form risque or It. rischio, risico, or risg (risco, risg; cf. Sp. riesgo). The Med. Lat. riscus, rischium, and risicum are found, according to Du Cange (Gloss., q.v.), as early as the 13th century. Skeat (Elym. Dict., 1910) accepts Dyer’s suggestion that the word is originally a sailor’s term, and is to be referred to Sp. risgo, a steep rock, from Lat. rescatum, to cut back, shut off; thus Sp. arrisgor, to run into danger, means literally “to go against a rock.”

RIST, JOHANN VON (1607–1667), German poet, was born at Ottens in Holstein on the 8th of March 1607; the son of the Lutheran pastor of that place. He received his early training in Hamburg and Bremen; after studying theology at Rinteln and Rostock, he became in 1633 private tutor in a family of Heide. At this time (1635) he was appointed pastor of the village of Wedel on the Elbe, where he remained until his death on the 31st of August 1667. Rist first made his name known to the literary world by a drama, Persœus (1634), which he wrote while at Heide, and in the next succeeding years he produced a number of dramatic works of which the allegory Das friedewinsende Teutschland (1647) and Das friedenssuchende Teutschland (1653) (new ed. by H. M. Schletterer, 1864) are the most interesting. Rist soon became the central figure in a school of minor poets, and honours were showered upon him from every side. The emperor Ferdinand III. crowned him laureate in 1644, ennobled him in 1653, and invested him with the dignity of a Count Palatine, an honour which enabled him to crown, and to gain numerous poets for the Elbschwanen order, a literary and poetical society which he founded in 1656. He had already, in 1645, been admitted, under the name “Daphnis aus Cimbrien,” to the literary order of Peggitz, and in 1647 he became, as “Der Rüstige,” a member of the Fruchtbringende Gesellschaft. It is, however, as a writer of church hymns (see HYMN) that Rist is best known to fame. Among these several are still retained in the evangelical hymn-book: e.g. O Ewigkeit, du Donnerwort and Ermuti’s diech, mein schwacher Geist. Collections of his poems appeared under the titles Musa Teudonia (1634) and Himmlische Lieder (1643).

RISTICH (or Ristic), JOVAN (1831–1890), Servian statesman, was born at Kragujevats in 1831. He was educated at Belgrade, Heidelberg, Berlin and Paris. After failing to obtain a professorship in the high school of Belgrade, he was appointed in 1861 Servian diplomatic agent at Constantinople. His reputation was enhanced by the series of negotiations which ended in the withdrawal of the Turkish troops from the Servian fortresses in 1867. On his return from Constantinople he was offered a ministerial post by Prince Michael, who described him as “his right arm,” but declined office, being opposed to the reactionary methods adopted by the prince’s government. He had already become the recognized leader of the Liberal party. After the assassination of Prince Michael in 1868, he was nominated member of the council of regency, and on the 2nd January 1869 the first Servian constitution, which was mainly his creation, was promulgated. When Prince Milan attained his majority in 1872, Ristic became foreign minister; a few months later he was appointed prime minister, but resigned in the following autumn (1873). He again became prime minister in April 1876, and conducted the two wars against Turkey (July 1876–March 1877 and December 1877–March 1878). At the congress of Berlin he laboured with some success to obtain greater advantages for Servia than had been accorded to her by the treaty of San Stefano. The provisions of the treaty of Berlin, however, disappointed the Servians, owing to the obstacles now raised to the realization of the national programme; the Ristic government became unpopular, and resigned in 1880. In 1887 King Milovan (who had assumed the royal title in 1882), alarmed at the threatening attitude of the Radical party, recalled Ristic to power at the head of a coalition cabinet; a new constitution was granted in 1888, and in the following year the king abdicated in favour of his son, Prince Alexander. Ristic now became head of a council of regency, entrusted with power during the minority of the young king, and a Radical ministry was formed. In 1892, however, Ristic transferred the government to the Liberal party, with which he had always been connected. This step and the subsequent
conduct of the Liberal politicians caused serious discontent in the country. On the 1st (13th) of April 1893 King Alexander, by a successful stratagem, imprisoned the regents and ministers in the palace, and, declaring himself of age, recalled the Radicals to office. Ristitch now retired into private life. He died at Belgrade on 4th September 1899. Though cautious and deliberate by temperament, he was a man of strong will and firm character. He was the author of two published works: The External Relations of Servia from 1848 to 1867 (Belgrade, 1887) and A Diplomatic History of Servia (Belgrade, 1890).

RISTORI, ADELAIDE (1822–1906), Italian actress, was born at Cividale del Friuli on the 30th of January 1822, the daughter of strolling players. As a child she appeared upon the stage, and at fourteen made her first success as Francesca da Rimini in Silvio Pellico’s tragedy. She was eighteen when for the first time she played Mary Stuart in an Italian version of Schiller’s play. She had been a member of the Sardinian company and also of the Ducal company at Parma for some years before her marriage (1840) to the marchese Giuliano Capranica del Grillo (d. 1861); and after a short retirement she returned to the stage and played regularly in Turin and the provinces. It was not until 1855 that she paid her first visit to Paris, where she was much admired by the public. She was selected for her début. In this she was rather coldly received, but she took Paris by storm in the title rôle of Alferi’s Myrtha. Furious partisanship was aroused by the appearance of a rival to the great Rachel. Paris was divided into two camps of opinion. Humble playgoers fought at gallery doors over the merits of their respective favourites. The two famous women never actually met, but the French actress seems to have been convinced that Ristori had no feelings towards her but those of admiration and respect. A tour in other countries, was followed (1856) by a fresh visit to Paris, when Ristori appeared in Montanelli’s Italian translation of Legouvé’s Medea. She repeated her success in this in London. In 1857 she visited Madrid, playing in Spanish to enthusiastic audiences, and in 1858 she paid the first of four visits to the United States, where she won much applause, particularly in Giacometti’s Elisabethe, an Italian study of the English sovereign. She finally retired from professional life in 1885, and died on the 9th of October 1896 in Rome. She left a son, the marchese Georgio Capranica del Grillo. Her Studies and Memoirs (1888) provide a lively account of an interesting career, and are particularly valuable for the chapters devoted to the psychological explanation of the characters of Mary Stuart, Elizabeth, Myrtha, Phaedra and Lady Macbeth, in her interpretation of which Ristori combined the highest dramatic instinct with the keenest and most critical intellectual study.

See also Kate Field, Adelaide Ristori: A Biography (New York, 1887); E. Peron Kingston, Adelaide Ristori: A Sketch of her Life (1886); Daily Telegraph (London, Oct. 10, 1906).

RITCHIE, CHARLES THOMSON RITCHIE, 1ST BARON (1839–1906), English politician, was born at Dundee, and educated at the City of London school. He went into business, and in 1874 was returned to parliament as Conservative member for the Tower Hamlets. In 1885 he was made secretary to the Admiralty, and from 1886 to 1892 president of the Local Government Board, in Lord Salisbury’s administration, sitting as member for St George’s in the East. He was responsible for the Local Government Act of 1888, instituting the county councils; and a large section of the Conservative party always owed his support to Ritchie. He was then promoted to the Home Office, and when Lord Salisbury’s later ministries, as member for Croydon, he was president of the Board of Trade (1890–1902), and home secretary (1895–1900); and when Sir Michael Hicks-Beach retired in 1902, he became chancellor of the exchequer in Mr Balfour’s cabinet. Though in his earlier years he had been a “fair-trader,” he was strongly opposed to Mr Chamberlain’s movement for a preferential tariff (see the articles on Balfour, A. J., and Chamberlain, J.), and he resigned office in September 1903. In December 1905 he was created a peer, but he was in ill-health, and he died at Biarritz on the 9th of January 1906.

RITCHIE, DAVID GORGE (1833–1903), Scottish philosopher, was born at Jedburgh, son of the Rev. George Ritchie, D.D. He had a distinguished university career at Edinburgh, and Balliol College, Oxford, and after being fellow of Jesus and tutor of Balliol was elected professor of logic and metaphysics at St Andrews. He was president of the Aristotelian Society in 1898. Among his works are: Darwinism and Politics (1889); Principles of State Interference (1891); Darwin and Hegel (1893); Natural Rights (1895); a translation with R. Lodge and F. E. Matheson of Bluntschi’s Theory of the State (1895); many articles in Mind, Philosophical Review, &c. His Philosophical Studies was edited with a memoir by R. Latta (1905).

RITSCHL, ALBRECHT (1822–1889), German theologian, was born at Berlin on the 25th of March 1822. His father, Georg Karl Benjamin Ritschl (1783–1858), became in 1810 pastor at the church of St Mary in Berlin, and from 1827 to 1854 was general superintendent and evangelical bishop of Pomerania. Albrecht Ritschl studied at Bonn, Halle, Heidelberg and Tübingen. At Halle he came under Hegelian influences through the teaching of Julius Schaller (1810–1868) and J. H. Erdmann (b. 1805). In 1845 he was entirely captivated by the Tübingen school, and in his work Das Evangelium Marcius und das Gleichnis vom Schlechtem Rathe (1846) he appeared as a disciple of F. C. Baur. This did not last long with him, however, for the second edition (1857) of his most important work, on the origin of the old Catholic Church (Die Entstehung der alt-kathol. Kirche), shows considerable divergence from the first edition (1850), and reveals an entire emancipation from F. C. Baur’s method. Ritschl was professor of theology at Bonn (extraordinary 1842; ordinary 1859) and Göttingen (1864; Consistorialrat also in 1874), his addresses on religion delivered at the latter university showing the impression made upon his mind by his enthusiastic studies of Kant and Schleiermacher. Finally, in 1866, came the influence of Rudolf Lotze. He wrote a large work on the Christian doctrine of justification and atonement, Die Christliche Lehre von der Rechtfertigung und Versöhnung, published during the years 1870–74, and in 1886–88 a history of pietism (Die Geschichte des Pietismus). His system of theology is contained in the former. He died at Göttingen on the 20th of March 1889.

His son, Otto Ritschl (b. 1859), after studying at Göttingen, Geneva, Berlin, and London, was professor of theology at Kiel (extraordinary 1889) and afterwards at Bonn (extraordinary 1894; ordinary 1897). He has published, amongst other works, Schleiermachers Stellung zum Christentum in seinen Reden über die Religion (1888), and a Life of his father (2 vols. 1892–96).

Ritschl claims to carry on the work of Luther and Schleiermacher, especially in ridding faith of the tyranny of scholastic philosophy. His system shows the influence of Kant’s destructive criticism of the claims of Pure Reason, recognition of the value of morally conditioned knowledge, doctrine of the kingdom of ends; of Schleiermacher’s historical treatment of Christianity, regulative use of the idea of religious fellowship, emphasis on the importance of religious feeling; and of Lotze’s theory of knowledge and treatment of personality. Ritschl’s work made a profound impression on German thought and gave a new confidence to German theology, while at the same time it provoked a storm of hostile criticism: his school has grown with remarkable rapidity. This is perhaps mainly due to the bold religious positivism with which he assumes that spiritual experience is real and that faith has not only a legitimate, but an indispensable role in the spiritual interpretation of the world. The life of trust in God is, in fact, not so much to be explained as to explain everything else. Ritschl’s standpoint is not that of the individual subject. The objective ground on which he bases his system is the religious experience of the Christian community. The “immediate object of theological knowledge is the faith of the community,” and from this positive religious datum theology constructs a “total view of the world and human life.” Thus the essence of Ritschl’s work is systematic theology. Nor does he painfully work up to his master-category, for it is given in the knowledge
of Jesus Christ revealed to the community. That God is love and that the purpose of His love is the moral organization of humanity in the "Kingdom of God"—this idea, with its immense range of application—is applied in Ritschl's initial datum.

From this vantage-ground Ritschl criticizes the use of Aristotelianism and speculative philosophy in scholastic and Protestant theology. He holds that such philosophy stands as a barrier to theology. Hegelianism attempts to squeeze all life into the categories of logic: Aristotelianism deals with "things in general" and ignores the radical distinction between nature and spirit. Neither Hegelianism nor Aristotelianism is "sufficient" enough for the development of religious life. Neither conceives "God" as "correlative to human trust" (cf. Theologie und Metaphysik, esp. p. 8 seq.). But Ritschl's recital carries him so far that he is left alone with merely "practical" experiences. That faith knows God in His active relation to the "kingdom," but not at all as "self-existing".

His limitation of theological knowledge to the bounds of human need might, if logically pressed, run perilously near phenomenology; and his epistemology ("we only know things in their activities") does not cover this weakness. In seeking ultimate satisfaction in the circle of "active conscious sensation," he rules out all "metaphysics." Indeed, much that is part of normal Christian faith—e.g., the Eternity of the Son—is passed over as beyond the range of his "theology of God and history" (Wettstein, Die theologie der theilte) illustrates this form of agnosticism. Religious judgments of value determine objects according to their bearing on our moral and spiritual welfare. They imply a lively sense of radical human need; and this sort of knowledge stands quite apart from that produced by "theoretical" and "disinterested" judgments. The former moves in a world of "values," and judges things as they are related to our "fundamental self-feeling." The latter moves in a world of "facts," and judges things as "exposed" to our knowledge.

Ritschl's formulation has such grave ambiguities, that his theology, which, as we have seen, is wholly based on uncompromising religious realism, has actually been charged with individualistic subjectivism. Ritschl, however, is clearly seeking not to "refold" and transform other types of knowledge, just as the "spiritual man" includes and transcends but does not annihilate the "natural man," then within the compass of this spiritually conditioned knowledge all other knowledge is possible, and to "be a philosopher and a home." The theory of value-judgments is part too of his ultra-practical tendency: both "metaphysics" and "mysticism" are ruthlessly condemned. Faith-knowledge appears to be wrenched from its bearings and suspended in a world of "facts," at the expense of will-psychology which he might have welcomed the hope of a more spiritual philosophy.

A few instances will illustrate Ritschl's positive systematic theology. In the preface to his "Theology and the Kingdom of God as a Fundamental Principle of Christianity," he states his intention to study the problem of the "kingdom," as spiritual reality revealed in spiritual purposefulness. His "love" is His will as directed towards the realization of His purpose, the "kingdom." But for a definition of purpose: With God as "first cause" or "Moral legislator," theology has no concern; nor is it interested in the speculative problems indicated by the traditional doctrine of the Trinity. "Natural theology" has no value save where it leans on the foundation of the re-conciliating the Son to the Father who have no bearing on experience, and therefore stand outside the range of theology.

Once more, in the doctrine of sin and redemption, the governing idea is God's fatherly purpose for His family. Sin is the contradiction of that purpose, and guilt is alienation from the family. Redemption is the reconciliation of the broken family relationship. All depends on the Mediator of Christ, who maintained the filial relationship even to His death, and who, as such, has given to the whole human race, the name of the family of God. The whole apparatus of "forensic" ideas (law, punishment, satisfaction, &c.) is summarily rejected as foreign to God's purpose of love. Ritschl is so faithful to the teaching of the religious community, that he has nothing definite to say on many inevitable questions, such as the relation of God to pagans races. His school, in which J. G. W. Herrmann, Julius Kaftan and Adolf Harnack are the chief names, diverges from his teaching in many directions; e.g., Kaftan appreciates the mystical side of religion, Harnack's criticism is very different from Ritschl's arbitrary excesses. They are united on the value of faith-knowledge as opposed to "metaphysics."

See A. Ritschl, Die Christliche Lehre von der Rechtfertigung unverdient in Ritschl's Christlichen Lehre (very many editions); and Die theologische und Metaphysik (2nd ed., 1887), give his main position. Many historical and other works besides.—E. Bertrand, Une nouvelle conceptions de la redemp- tion, La Théologie de la réconciliation et de la conciliation dans l'oeuvre de Rits (1859); H. Schenck, Les Origines historiques de la théologie de Ritschl (1893); G. Eck, Die theologische Schule, A. Ritschl's und die evangelische Kirche de Gegenwart (1897); James Orr, The Ritschlian Theology and the Evangelical Faith (London 1894) E. Garvie, The Ritschlian Theology (Edinburgh 1899), in both of which the bibliography of the movement is given.

R. Pfleiderer, Development of Theology in Germany since Kant (1890). The German literature on the subject is very large; see article in Heros-Hauck, vol. xvi.

RITSCHL, FRIEDRICH WILHELM (1806–1879), German scholar, was born in 1806 in Thuringia. His family, in which culture and poverty were hereditary, were Protestants who had migrated several generations earlier from Bohemia. Ritschl was fortunate in his school training, at a time when the great reform in the higher schools of Prussia had not yet been thoroughly carried out. His chief teacher, Spitzner, a pupil of Gottfried Hermann, divined the boy's genius and allowed him free growth, applying only so much either of stimulus or restraint as was absolutely needed. After passing the laurea at the university of Halle, where Hermann stood at the zenith of his fame, Ritschl passed in 1826 to Halle. Here he came under the powerful influence of Reising, a young "Hermannian" with exceptional talent, a fascinating personality and a rare gift for instilling into his pupils his own ardor for classical study. The great controversy between the "Realists" and the "Verbalists" was then at its height, and Ritschl naturally sided with Hermann against Boeckh. The early death of Reising in 1828 did not sever Ritschl from Halle, where he began his professorial career with a great reputation and brilliant success, but soon heathers fell away, and the pinches of poverty compelled his removal to Breslau, where he reached the rank of "ordinary" professor in 1834, and held other offices. The great event of Ritschl's life was a sojourn of nearly a year in Italy (1836–37), spent in libraries and museums, and more particularly in the laborious examination of the Ambrosian palimpsest of Plautus at Milan. The remainder of his life was largely occupied in working out the material then gathered and the ideas then conceived. Bonn, whether he removed in his marriage in 1839, and where he remained for twenty-six years, was the great scene of his activity both as scholar and as teacher. The philological seminar which he controlled, although nominally only joint-director with Welcker, became a veritable officina litterarum, a kind of Isocratean school of classical study; in it were trained many of the foremost scholars of the last forty years. The names of George Curtius, Ihne, Schleicher, Bernays, Ribbeck, Lorenz, Vahlen, Hüblner, Bücheler, Helbig, Benndorf, Riese, Windisch, were his pupils either at Bonn or at Leipzig, attest his fame and power as a teacher. In 1854 Otto Jahn took the place of the venerable Welcker at Bonn, and after a time succeeded in dividing with Ritschl the empire over the philological school there. The two had been friends, but after gradual estrangement a violent dispute arose between them in 1865, which for many months divided into two hostile forces the universities and the press of Germany. Both sides were steeped in fault, but Ritschl undoubtedly received harsh treatment from the Prussian government, and pressed his resignation. He accepted a call to Leipzig, where he died in harness in 1876.

Ritschl's character was strongly marked. The spiritual element in him was powerful, and to some at times he seemed overbearing, but his nature was noble at the core; and, though intolerant of inefficiency and stupidity, he never asserted his personal claims in any mean or petty way. He was warmly attached to family and friends, and yearned continually after sympathy, yet he established real intimacy with only a few. He had a great faculty for organization, as is shown by his
administration of the university library at Bonn, and by the eight years of labour which carried to success a work of infinite complexity, the famous Priscae Latinae Monumenta Epigraphica (Bonn, 1862). This volume presents in admirable acumen, with preface notices and indexes, the Latin inscriptions from the earliest times to the end of the republic. It forms an introductory volume to the Berlin Corpus Inscriptionum Latinarum, the excellence of which is largely due to the precept and example of Ritschl, though he had no hand in the later volumes. The results of Ritschl’s life are mainly gathered up in a long series of monographs, for the most part of the highest finish, and rich in ideas which have deepened the scholarship of the time.

As a scholar, Ritschl was of the lineage of Bentley, to whom he looked up, like Hermann, with fervent admiration. His best efforts were spent in studying the languages and literatures of Greece and Rome, rather than the life of the Greeks and Romans. He was sometimes, but most unjustly, charged with taking a narrow view of “Philology.” That he keenly appreciated the importance of ancient institutions and ancient art both his published papers and the records of his lectures amply testify. He devoted himself for the most part to the study of ancient poetry, and in particular of the early Latin drama. He ranged over a centre from which his investigations radiated. Starting from this he ranged over the whole remains of pre-Ciceronian Latin, and not only analysed but augmented the sources from which our knowledge of it must come. Before Ritschl the acquaintance of scholars with early Latin was so dim and restricted that it would perhaps be hardly an exaggeration to call him its real discoverer.

To the world in general Ritschl was best known as a student of Plautus. He cleared away the accretions of ages, and by efforts of that real genius which goes hand in hand with labour, brought to light many of the true features of the original. It is infinitely to be regretted that Ritschl’s results were never combined to form that monumental edition of Plautus of which he dreamed in his earlier life. Ritschl’s examination of the Plautine MSS. was both laborious and brilliant, and greatly extended the knowledge of Plautus and of the ancient Latin drama. Of this, two striking examples may be cited. By the aid of the Ambrosian palimpsest he recovered the name T. Maccius Plautus, for the vulgate M. Accius, and proved correspondences of verse and metres which had been wholly unknown. Ritschl proved that they meant “Canticum” and “Diverbiun,” and hence showed that in the Roman comedy only the conversations in iambic senarii were not intended for the singing voice. Thus was brought into strong relief a fact without which there can be no true appreciation of Plautus, viz. that his plays were comic operas rather than comic dramas.

In conjectural criticism Ritschl was inferior not only to his great predecessors but to some of his contemporaries. His imagination was in this field (but in this field only) hampered by erudition, and his judgment was unconsciously warped by the desire to find in his text illustrations of his discoveries. But still a fair proportion of his textual labours has stood the test of time, and he rendered immense service by his study of Plautine metres, a field in which little advance had been made since the time of Bentley. In this matter Ritschl was aided by an accomplishment rare (as he himself lamented in Germany the art of writing Latin verse). In spite of the incompleteness, on many sides, of his work Ritschl must be assigned a place in the history of learning among a very select few. His studies are presented principally in his Oeuvres collected partly before and partly since his death. The Trinumum (twice edited) was the only specimen of his contemplated edition of Plautus which he completed. The edition has been continued by some of his pupils—Goetz, Loewe and others.

The facts of Ritschl’s life may be best learned from the elaborate biography by Otto Ribbeck (Leipzig, 1879). An interesting and discriminating estimate of Ritschl’s work is that by Lucian Mueller (Berlin, 1877). (J.S.R.)

RITSON, JOSEPH (1752-1803), English antiquary, was born at Stockton-on-Tees, of a Westmorland yeoman family, on the 2nd of October 1752. He was educated for the law, and settled in London as a conveyancer when twenty-two. He devoted his spare time to literature, and in 1782 published an attack on Watton’s History of English Poetry. The fierce and insulting tone of his Observations, in which Watton was treated as a showy pretender, and charged with cheating and lying to cover his ignorance, made a great sensation in literary circles. In nearly all the small points with which he dealt Ritsbn was in the right, and his corrections have since been adopted, but the unjustly bitter language of his criticisms roused great anger at the time, much, it would appear, to Ritsbn’s delight. In 1783 Johnson and Steevem were assailed in the same bitter fashion as Watton for their text of Shakespeare. Bishop Percy was next subjected to a furious onslaught in the preface to a collection of Ancient Songs (printed 1787, dated 1790, published 1792). The only thing that can be said in exculpation of Ritsbn’s unmatchable acrimony is that he spared no pains himself to ensure accuracy in the texts of old songs, ballads and metrical romances which he edited. His collection of the Robin Hood ballads is perhaps his greatest single achievement. Scott, who admired his industry and accuracy in spite of his temper, was almost the only man who could get on with him. On one occasion, when he called in Scott’s absence, he spoke so rudely to Mrs Scott that Leyden, who was present, threatened to “throw his neck,” and throw him out of the window. Spelling was one of his eccentricities, his own name being an example: Ritsbn is short pronunciation for Richardson. As early as 1796 Ritsbn showed signs of mental collapse, and on the 10th of September 1803 he became completely insane, barricaded himself in his chambers at Gray’s Inn, made a bonfire of manuscripts, and was finally forcibly removed to Hoxton, where he died on the 23rd of the month.

RITTENHOUSE, DAVID (1732-1796), American astronomer, was born at Germantown, Pennsylvania, on the 8th of April 1732. First a watchmaker and mechanician he afterwards became treasurer of Pennsylvania (1777-80), and from 1792 to 1795 director of the U.S. mint (Philadelphia). He was largely occupied in 1763 and in 1770-80 in settling the boundaries of several of the states. He was a fellow of the Royal Society of London, and a member of the American Philosophical Society; and was elected president of the latter society in 1791. As an astronomer, Rittenhouse’s principal merit is that he introduced in 1786 the use of spider lines in the focus of a transit instrument. His priority with regard to this useful invention was acknowledged by E. Troughton, who brought spider lines into universal use in astronomical instruments (see von Zach’s Monatliche Correspondens, vol. ii. p. 215), but Felice Fontana (1730-1805), professor of physics at the university of Pisa, and afterwards director of the museum at Florence, had already anticipated the invention in 1775, though no doubt this fact was unknown to Rittenhouse. His researches were published in the Transactions of the American Philosophical Society (1785-1798). He died at Philadelphia on the 26th of June 1796.

See Memoir (1813) by William Barton.

RITTER, HEINRICH (1751-1860), German philosopher, was born at Zerbst on the 21st of November 1751, and died at Göttingen on the 3rd of February 1860. He studied philosophy and theology at Göttingen and Berlin until 1815. In 1824 he became extraordinary professor of philosophy at Berlin, whence he was transferred to Kiel, where he occupied the chair of philosophy from 1833 to 1837. He then accepted a similar position at the university of Göttingen, where he remained till his death. His chief work was a history of philosophy (Geschichte der Philosophie) published in twelve volumes at Hamburg from 1829 to 1853. This book is the product of a wide and thorough knowledge of the subject aided by an impartial critical faculty, and its value is demonstrated by the
fact that it has been translated into almost all the languages of Europe. He wrote also accounts of ancient schools of philosophy, the Ionians, the Pythagoreans and the Megarians. Beside these important historical works, he published a large number of treatises of which the following may be mentioned: Vorbericht zur Verständigung über die neueste deutsche Philosophie zeit Kant (1853); Die christliche Philosophie bis auf die neuesten Zeiten (2 vols., 1858–59), a work which supplemented the Geschichte; Abriß der philosophischen Logik (1824); Ueber das Verhältnis der Philosophie zum Leben (1835); Historia philosophica Graeco-Romanae (in collaboration with Preller, 1838; 7th ed., 1888); Kleine philosophische Schriften (1839–40); System der Logik und Metaphysik (1856); Encyclopädie der philosophischen Wissenschaften (1862–64); Ernest Renan, über die Naturwissenschaften und die Geschichte (1865); Ueber das Bäse und seine Folgen (1869). Of these latter, the one best known in England is the History of Greek and Roman Philosophy, which, by reason of the excellence of its arrangement and its judicious quotations and notes, is almost indispensable to the student of ancient philosophy.

Ritter, Karl (1779–1859), German geographer, was born at Quedlinburg on the 7th of August 1779, and died in Berlin on the 28th of September 1859. His father, a physician, left his family in straitened circumstances, and Karl was taken into the service of the post office, founded by Christian Gottlieb Salzmann (1744–1811) for the purpose of his educational training. The Salzmann system was practically that of Rousseau; conformity to natural law and enlightenment were its watchwords; great attention was given to practical life; and the modern languages were carefully taught, to the complete exclusion of Latin and Greek. Ritter already showed geographical aptitude, and when his school-days were drawing to a close his future course was determined by an introduction to Bethmann Hollweg, a banker in Frankfurt. It was arranged that Ritter should become tutor to Hollweg's children, but that in the meantime he should attend the university at his patron's expense. His duties as tutor in the Hollweg family began at Frankfurt in 1798 and continued for fifteen years. The years 1814–19, which he spent at Göttingen in order still to watch over the welfare of his pupils, were those in which he began to devote himself exclusively to geographical inquiries. He had already travelled extensively in Europe when in 1817–18 he fleshed out his first masterpiece, Die Erdkunde und der Verhältnis zu ihrer Verwaltung (Berlin, 2 vols., 1817–1818). In 1819 he became professor of history at Frankfurt, and in 1820 professor extraordinarius of history at Berlin, where shortly afterwards he began also to lecture at the military college. He remained in this position till his death. The second edition of his Erdkunde (1822–25) was conceived on a much larger scale than the first, but it completed only the sections on Africa and the various countries of Asia. The service rendered to geography by Ritter was especially notable because he brought to his work a new conception of the subject. Geography was, to use his own expression, a kind of physiology and comparative anatomy of the earth: rivers, mountains, glaciers, &c., were so many distinct organs, each with its own appropriate functions; and, as his physical frame is the basis of the man, determinative to a large extent of his life, so the structure of each country is a leading element in the historic progress of the nation. Moreover, Ritter was a scientific compiler of the first rank. Among his minor works may be mentioned Vorhalle europäischer Volkergeschichten (Berlin, 1828); Der indobaskischen Königreiche und die Kolosse von Bamiyan (1838); Einleitung zur allgemeinen vergleichenden Geographie (Berlin, 1852); Bemerkungen über Veranlassungsmittel räumlicher Verhältnisse bei graphischen Darstellungen durch Form u. Zahl," in the Trans. of the Berlin Academy, 1828. After his death selections from his lectures were published under the titles Geschichte der Erdkunde (1861), Allgemeine Erdkunde (1862), and Europa (1865). Several of his works (e.g. the "Palestine" volumes of his Erdkunde) were translated into English. "Karl Ritter" foundations were established in his memory at Berlin and Leipzig, for the furtherance of geographical study.

RITUAL (from Lat. ritus, a custom, especially a religious rite or custom), a term of religion, which may be defined as the routine of worship. This is a "minimum definition"; "ritual" at least means so much, but may stand for more. Without some sort of ritual there could be no organized method in religious worship. Indeed, viewed in this aspect, ritual is to religion what habit is to life, and its rationale is similar, namely, that by bringing subordinate functions under an effortless rule it permits undivided attention in regard to vital issues. This analogy—for it is safer to regard such applications of individual psychology to social phenomena as only analogies—may be carried a step further. Just as the main business of habit is to secure bodily equilibrium in order to allow free play to the mental life, so the chief task of routine in religion is to organize the activities necessary to its stability and conservative character. Personal spontaneity and initiative may be directed into spiritual channels. Such organization will naturally affect far more than the forms of worship; but these at least, to judge from the past history of religion, cannot but submit extensively to its influence. The nature of religion, as the sociologist understands it, is bound up with its congregational character. In order that inter-subjective relations should be maintained between fellow-worshippers, the use of one or another set of conventional symbols is absolutely required; for example, an intelligible vocabulary of meet expressions, or (since this is, perhaps, not indispensable) at any rate sounds, sights, actions and so on, that have come by prescription to signify the common purpose of the religious society, and the means taken in common for the realization of that purpose. In this sense, the term "ritual," as meaning the prescribed ceremonial routine, is also extended to observances not strictly religious in character.

But, whilst ritual at least represents routine, it tends, historically speaking; to have a far deeper significance for the religious life of mankind. In all organized, temporal, and many of its phenomena would even consider constant and typical, is the attribute of a more or less self-contained and automatic efficacy to the ritual procedure as such. Before proceeding to considerations of genesis, it will be convenient briefly to analyse the notion as it appears in the higher religions. Two constituent lines of thought may be distinguished. Firstly, there is the tendency to pass beyond the purely petitionary attitude which as such can imply no more than the desire, hope or expectation of divine favour, and to take for granted the consummation sought, a deity that answers, a grace and blessing that are communicated. Only when such accomplishment of its end is assumed can efficacy be held to attach to the act of worship. Secondly, there is the tendency to identify such a self-accomplishing act of worship with its objective expression in the ritual that for purposes of mutual understanding makes the body of worshippers one.

The Magical Element in Ritual.—Exactly similar tendencies—to impute efficacy, and to treat the ritual procedure as the crucial act of that efficacy—are typically characteristic of magic, and the case is not hard to be taken, a coincidence, seeing that magic and religion would appear to have much in common, at any rate during the earlier stages of their development. In magic a suggestion is made orally, or by dramatic action, or most often in both ways together, that is held ipso facto to bring about its own accomplishment. A certain conditionality attaches to the magical operation, inasmuch as each magician is subject to interference on the part of other magicians who may neutralize his spell by a
counter spell of equal or greater power; nevertheless, the
intrinsic to is that of a categorical assertion of binding force
and efficacy. Again, in magic the self-realizing force is apt to
seem to reside in the suggestional machinery rather than in the
spiritual qualifications of the magician, though this is by no
means invariably the case. On the whole, however, spells
and ceremonies are wont to be regarded as an inheritable and
transferable property containing efficacy in themselves.
And what is true of magic is equally true of much of primitive, and
even of relatively advanced, religion. Dr. J. G. Frazer has
pronounced the following to be marks of a primitive ritual:
negatively, that there are no priests, no temples and no gods
(though he holds that departmental, non-individual “spirits”
are recognized); positively, that the rites are magical rather
than propitiatory (The Golden Bough, 2nd ed. i. 201). If we
leave it an open question whether, instead of “spirits,” it
would not be safer to speak of “powers” (to which not a
soul-like nature, but simply a capacity for exercising magic,
is attributed), this characterization may be accepted as apply-
ing to many, if not to all, the rites of primitive religion.
Thus the well-known totemic ceremonies of Central Australia
are a striking example of rites of a deeply religious import—in
the sense that the purpose they embody is that of consecrating
certain functions of the common life (see Religion)—yet
almost wholly magical in form. They resolve themselves on
analysis into (1) direct acts of magical suggestion, and (2) acts
commemorative of the magical doings of mythical ancestors,
the purport of which may be regarded as indirectly and con-
structively magical, on the principle that in magic to mention
a thing’s origin is to control it, to recount another’s wonder-
working is to reproduce his power, and so on. It is to be noted,
however, that other Australian rites are found, notably those
that accompany initiation in the south-eastern region, over
which anthropomorphic beings having enough individuality
to rank as “gods” undoubtedly preside; but here even,
though traces of propitiatory worship may be discernible (the
evidence being scanty and conflicting), acts of pure magic are
decidedly to the fore. And what is true of the most
primitive and unreflective forms of cult remains true of more
advanced types which have become relatively self-conscious.
There is little or no felt opposition between processes imply-
ing control and processes of a propitiatory character in the
religion of the Pueblo Indians, which American ethnologists
have been so successful in expounding, or, to mount to a still
higher level, in the Vedic, Assyrian or Egyptian cults.
The leading idea, we may even say, is that expressed so happily
by a character in Renan’s Le Prêtre de Némi: “L’ordre du
monde dépend de l’ordre des rites qu’on observe” (cf. A. Lang,
Myth, Ritual and Religion, 2nd ed. i. 251). As regards the
most developed forms of religion, whilst the old procedure
largely survives unchanged, its original intention is disowned
by theologians, though it may be doubted if the popular mind
is always strong enough to withstand the appeal of prima facie
appearance.

The proneness to impute efficacy to ritual is immensely
reinforced by another social privity, more or less distinct in
its ultimate nature, which causes the rite to rank as a divine
ordnance or command. Naturally if the god manifests himself
by means of certain forms, if he is reputed to have founded or
revealed them, or if he has been known to evince displeasure
at departures from them, there is strong reason to think that
such forms are efficacious, and that in a sense of themselves,
namely, by being what they are. At the sociological level
of thought this divine sanction has to be treated as the echo
of a social sanction which ratifies and protects religious
custom. In early society the influence of what Walter Bagehot
(in Physics and Politics, 9th ed. p. 102) calls the “persecuting
tendency” in enforcing custom is on the whole not markedly
in evidence. The fact is that imitation in a homogeneous group
produces such unanimity that, with the help of some education,
notably the instruction given at the time of initiation, all non-
conformity is nipped in the bud. Of the Central Australian
ceremonies we read that they “had to be performed in precisely
the same way in which they had been in the Alcherings (lit.
‘dream-time’ = age of mythical tribal ancestors). Everything
was ruled by precedent; to change even the decoration of a per-
fomer would have been an unheard-of thing; the reply, ‘It was so
in the Alcherings,’ was considered as perfectly satisfactory by way
of explanation” (B. Spencer and F. Gillen, The Native Tribes
of Central Australia, 324). Here we perceive the social sanction
of public opinion insensibly merging in a supernatural sanction.
The tribe is a religious partnership with a divine past with which
it would not willingly break. As Mr Lang well puts it, “Ritual
is preserved because it preserves luck” (loc. cit.). Given an
intrinsic sacredness, it is but a step to associate definite gods with
the origin or purpose of a rite, whose interest it thereafter
becomes to punish omissions or innovations by the removal
of their blessing (which is little more than to say that the rite loses
its efficacy), or by the active infliction of disaster on the com-
nunity. In the primitive society it is hard to point to any
custom to which sacredness does not in some degree attach, but,
naturally, the more important and solemn the usage, the more
rigid the religious conservatism. That there are such cases is
incomprehensible that in Australia, at the highly sacred ceremony of circumcision,
the fire-stick was employed after stone implements were known;
and we have an exact parallel at a higher level of culture, the
stone implement serving for the same operation when iron is
already in common use (Spencer and Gillen, ib. 401; cf. E. B.

The Interpretation of Ritual.—A valuable truth insisted on by
the late W. Robertson Smith (Religion of the Semites, 17 sqq.)
is that in primitive religion it is ritual that generates and sustains
myth, and not the other way about. Sacred lore of course cannot
be dispensed with; even Australian society, which has hardly
reached the stage of having priests, needs its Oikinara or a
“great instructor” (Spencer and Gillen, ib. 303). The function of
such an expert, however, is chiefly to hand on mere rules for
the performance of religious acts. If his lore include sacred
histories, it is largely, we may suspect, because the description
and dramatization of the doings of divine persons enter into
them as a means of magical control. Similarly, the sacred
books of the religions of middle grade teem with minute
prescriptions as to ritual, but are almost destitute of doctrine.
Even in the highest religions, where orthodoxy is the main require-
ment, and ritual is held merely to symbolize dogma, there is a remark-
able rigidity about the dogma that is doubtless in large part due to
its association with ritual forms many of them bearing the
most primeval stamp. As regards the symbolic interpretation of
ritual, this is usually held not to be primitive; and it is
doubtless true that an unreflective age is hardly aware of the
difference between “outward sign” and “inward meaning,”
and thinks as it were by means of its eyes. Nevertheless,
it is easier to define fetishism (a fetish “differing from an idol in
that it is worshipped in its own character, not as the symbol,
image or occasional residence of a deity,” New English Dictionary,
Oxford, 1901) than it is to bring such a fetishism home to any
savage people, the West African negroes not excluded (cf. A. B.
Ellis, The tribes—Speaking Peoples of the Gold Coast of W. Africa,
192). It is the magic power, virtue or grace residing in,
and proceeding from, the material object—a power that is unshak-
able of which constitutes the whole working hypothesis of the
magico-religious phenomenon—that is valued in those cases
where native opinion can be tested. Moreover, it must be
remembered that in the act of magic a symbolic method is
consciously pursued, as witness the very formulas employed:
“as I burn this image, so may the man be consumed,”
or the even more explicit, “It is not wax I am scorching; it is
the liver, heart and spleen of So and so that I scorched” (W. W. Skeat,
Malay Magic, 570), where appearance and reality are distinguished
in order to be mystically reunited. Now it is important to
observe that from the symbol as embodying an imperative to the
symbol as expressing an optative is a transition of meaning that
involves no change of form whatever; and, much as theorists
love to contrast the suggestion al and the petitionary atti-
itudes,
RITUAL

it is doubtful if the savage does not move quite indifferently to and fro across the supposed frontier-line between magic and religion, interspersing "buff" with blundershill, spell with god-pan. Meanwhile the particular meanings of the detailed acts composing a complicated piece of ritual soon tend to lose themselves in a general sense of the efficacy of the rite as a whole to bring blessing and avert evil. Nay, unintelligibility is so far from invalidating a sacred practice that it positively supports it by deepening the characteristic atmosphere of mystery. Even the higher religions show a lingering predilection for cabalistic formulas.

Changes in Ritual.—Whilst ritual displays an extraordinary stability, its nature is of course not absolutely rigid; it grows, alters and decays. As regards its growth, there is hardly a known tribe without its elaborate body of magico-religious rites. In the exceptional instances where this feature is relatively absent (the Masai of E. Africa offer a case in point), we may suspect a disturbance of tradition due to migration or some similar cause. Thus there is always a pre-existing pattern in accordance with which such evolution or invention as occurs proceeds. Unconscious evolution is perhaps the more active factor in primitive times; imitation is never exact, and small variations amount in time to considerable changes.

On the other hand, there is also deliberate innovation. In Australia councils of the older men are held day by day during the performance of their ceremonies, at which tradition is repeated, the act being mainly determined by the desire to preserve custom but undoubtedly in part also to alter it. Moreover, the individual religious genius exercises no small influence. A man of a more original turn of mind than his fellows will claim to have had a new ceremony imparted to him in a vision, and such a ceremony will even be adopted by another tribe which has no notion of its meaning (Spencer and Gillen, ib. 272, 278, 281 n.). Meanwhile, since little is dropped whilst so much is being added, the result is an endless complication and elaboration of ritual. Side by side with elaboration goes systematization, more especially when local cults come to be merged in a wider unity. Thereupon assimilation is likely to take place to one or another leading type of rite—for instance, sacrifice or prayer. At these higher stages there is more need than ever for the expert in the shape of the priest, in whose hands ritual procedure becomes more and more of a conscious and studied discipline, the naive popular elements being steadily eliminated, or rather transformed. Not but what the transfer of ritualistic duties to a professional class is often the signal for slack and mechanical performance, with consequent decay of ceremonial. The trouble and worry of having to comply with the endless rules of a too complex system is apt to operate more widely—namely, in the religious society at large—and to produce an endless crop of evasions. Good examples of these on the part alike of priests and people are afforded by Toda religion, the degenerate condition of which is expressly attributed by Dr W. H. R. Rivers to the "over-development of the ritual aspect of religion" (The Todas, 454–55). It is interesting to observe that a religion thus atrophied tends to revert to purely magical practices, the use of the word of power, and so on (ib. ch. x). It is to be noted, however, that what are known as ritual substitutions, though they lend themselves to purposes of evasion (as in the well-known case of the Chinese use of paper money at funerals), rest ultimately on a principle that is absolutely fundamental in magico-religious theory—namely, that what suggests a thing because it is like it or a part of it becomes that thing when the mystic power is there to carry the suggestion through.

The Classification of Rites.—More than one basis of division has suggested itself. From the sociological point of view perhaps the most important distinction in use is that between public and private rites. Whilst the former essentially belong to religion as existing to further the common weal, the latter have from the earliest times an ambiguous character, and tend to split into those which are licit—"sacraments," as they may be termed—and those which are considered anti-social in tendency, and are consequently put behind the pale of religion and assigned to the "black art" of magic. Or the sociologist may proceed to correlate rites with the several types of social organization—the tribe, the clan, the family and so on. Another interesting contrast is how far a function of religion it is to establish a calendar of sacred seasons is that between periodic and occasional rites—one that to a certain extent falls into line with the previous dichotomy. A less fruitful method of classing rites is that which arranges them according to their inner meaning. As we have seen, such meaning is usually acquired ex post facto, and typical forms of rite are used for many different purposes; so that attempts to differentiate are likely to beget more equivocations than they clear up. The fact is that comparative religion must be content to regard all its classifications alike as pieces of mere scaffolding serving temporary purposes of construction.

Negative Rites.—A word must be added on a subject dealt with elsewhere (see TABOO, GENNA), but strictly germane to the matter in hand. What have the best, if not the sole, right to rank as taboos are ritual interdictions (see M. Mauss in L'Année sociologique, ix. 249). Taboo, as understood in Polynesia, the home of the yard, is as wide as, and no wider than, religion, representing one side or aspect of the sacred (see RELIGION). The very power that can help can also blast if approached improperly and without due precautions. Taboos are such prohibitions, abominations prompted, not by simple dread, but wisely, that in wars, in ritual and in art towards which in other circumstances or in other form has healing virtue. Thus the negative attitude of the observer of taboo involves a positive attitude of reverence from which it becomes in practice scarcely distinguishable. To keep a fast, for instance, is looked upon as a direct act of worship. It must be noted, too, that, whereas taboo as at first conceived belongs to the magico-religious circle of ideas, implying a quasi-physical transference of sacredness from what has it to one not fit to receive it, it is very easily reinterpreted as an obligation imposed by the deity on his worshippers. The law observed by a primitive religious community abounds in negative precepts, and if early religion tended to be a religion of fear it is because the taboo-breaker provides the most palpable objective for human and divine sanctions. In the higher religions, to be pure remains amongst the most laudable of aspirations, and, even though the ceremonial aversion of a former age has become moralized, and a purity of heart set up as the ideal, it is on "virtues of omission" that stress is apt to be laid, so that a timorous propriety is too often preferred to a forceful grappling with the problems of life. There are signs, however, that the religious consciousness has at length come to appreciate the function of routine in religion as elsewhere is to clear the way for action.

BIBLIOGRAPHY.—A comprehensive study of ritual as such from the comparative standpoint remains yet to be written. Some leading ideas on the subject are struck out by E. B. Tylor, Primitive Culture (1877), ch. 18; and A. Lang, Myth, Ritual and Religion (1884) whilst the whole of J. G. Frazer's vast collection of facts in The Golden Bough (1890) illustrates ritual, more especially on its magico-religious side; see also W. Robertson Smith, Lectures on the Religion of the Semites (1889). A very valuable work of restricted range but embodying a method that might fruitfully be applied to the whole field of ritual is H. L. Stevenson, The Nature of Ritual (1902). M. Mauss, "Essai sur la fonction et la structure du sacrifice" in L'Année sociologique, ii.; in close connexion with the above should be studied S. Lévi, La Doctrine du sacrifice dans les Brahmanas (1899); W. Caland and V. Henry, "Les origines de l'impреш}, comprising the form of sacrifice known as le sacrifice de la vache sacrée" in Revue de l'histoire des religions (1906); and also J. J. Ogborn, Die Religion der Vened (1894); A. Hillebrand, Ritual Literatur: Vedische Opfer und Zauber (1896). Admirable descriptions of Australian ritual are to be found in B. Spencer and F. J. Gillen, The Native Tribes of Central Australia (1899). On North American rituals very excellent studies exist in A. C. Fletcher, The Hako: A Pawnee Ceremony, in 12nd Report of Bureau of American Ethnology; see also various papers by the same authors in Peabody Reports; likewise in J. W. Fewkes, "Tusayan Katchinas," in 15th Rep. of B. of A. Eth.; and id., "Hopi Katchinas," in 21st Rep.; M. C. Stevenson, "The Zuñi Indians," in 23rd Rep.; cf. F. H. Cushing, "Züni Fericges," in 29th Rep. The following works pay special attention to ritual
RITUAL MURDER—RIVE-DE-GIER

RITUAL MURDER, a general term for human sacrifice in connexion with religious ceremonies. False accusations as to the practice of ritual murder by Jews and Christians have often been made. “The Christians of the second and third centuries suffered severely under them” (Strack). Justin Martyr (150-160) in his Second Apology (ch. 12) vigorously defends the Christian community against this charge; Octavius, Minucius Felix, Tertullian, Origen and other Church fathers all refer to the subject and indignantly repudiate the atrocious libel that the Eucharist involved human sacrifice. The myth was revived against the Montanists, and in the later middle ages against various sects of heretical Christians. In recent years the accusation has been again levelled against “foreigners” during the disturbances in China. The chief sufferers, however, from the charge were the Jews. The charge was never coherently defined, but a notion prevailed that at the Passover Christian blood was used in Jewish rites. For this belief there is no foundation whatever, as is shown in the classical treatise on the subject by Hermann L. Strack, Regius Professor of Theology at Berlin University. The first occasion on which the medieval Jews were accused of the murder of a Christian child was at Norwich in 1144. In the following century other instances of the charge occurred on the Continent, and by this time (middle of the 13th century) the legend had grown into a belief that “the Jews of every province annually decide by lot” which congregation or town is to be the scene of the mythical murder. It is easy to understand how in ages when the Jews were everywhere regarded with superstitious awe, such stories to their detriment would find ready credence, but the revival of the myth in recent times by the anti-Semite is a deplorable instance of degeneration. It is only necessary here to refer to the Lincoln case (1253), the Trent case (1475) and more recently the Damascus case (1840), the Tisza-Eszlar affair (1882), the Xanten charge (1891) and the Polna case (1899). All of these charges—sometimes invented by malicious seceders from the Jewish fold—were followed by spoliation and tragic persecution of the Jews. On the other hand many Jewish professors of the Christian faith have strenuously defended the Jews from the charge, among them was particularly named Prof. D. Chwolson (Blutklaige, 1901). In 1840 a protest against the charge was signed by 58 Jewish-Christians, the list being headed by M. S. Alexander, Anglican bishop at Jerusalem. Further testimonies of a similar kind are collected in Strack (op. cit. p. 239). Many of the popes have issued bulls exonerating the Jews (cf. Strack, p. 250); similarly temporal princes have often taken a similar step (ibid. p. 260). Many Christian scholars and ecclesiastics have felt it their duty to utter protests in favour of the Jews. Among them have been the most eminent Christian students of Rabbinism of recent times, e.g. Professors Alexander McCaul, P. Lagarde, Franz Delitzsch, A. Merz, T. Nöldeke, C. Siegfried, A. Wünsche, G. H. Dalman and J. von Döllinger. A careful examination of the evidence (with a complete acquittal of the Jews) is contained in a notable work by a Catholic priest, F. Franck, Der Ritusmaur vor den Gerichtshöfen der Wahrheit und der Gerichtskraft (1901, 1902). The literature on the other side is entirely antisemitic and in no instance has it supported the ordeal of the Jews. It is the most notorious exponent of the charge, Moses A. Roehling, the worthlessness of whose writings on the subject is exposed by (among many others) Strack (op. cit. pp. 155 seq.).

A list of some of the most important of the cases is given by J. Jacob in the Jewish Encyclopedia, iii. 266-67. (I. A.)

RIVA, a fortified district town of Tirol, Austria, near the Italian frontier. Pop. (1900) 7,550. It is a lake-port and steamship station at the northern extremity of the Lago di Garda. There are two forts on the Monte Brione a little over a mile north-east of the town, and the old castle of La Rocca was reconstructed and extended in accordance with modern requirements in 1850. The Minorite Church (1603), with altar pictures by Guido Reni and other Italian painters, is much frequented as a place of pilgrimage. In addition to its transit trade and the entertainment of visitors, the principal resources of the town are the manufacture of paper, iron wares and pottery, the cultivation of the silk-worm and the olive tree, and a considerable commerce in timber, planks and coal. Riva is connected with the Ledro valley by a picturesque road which passes in a series of tunnels and galleries along the rocky and precipitous west shore of the lake.

RIVAL, one who competes with another, one who strives to out-do or excel another or to gain an object or end before or in preference to another. The Latin rivalis, which was in classical Latin used of a competitor in love, meant by derivation one who used the same brook or stream (ritus) as another, hence a neighbour; thus in the Digest, xiiii. 20. i. 26, “si inter rivalia, id est qui per eundem rivum aquam ducunt, sit contentio de aquae usu.” The term naturally applied more particularly to those who lived on opposite sides of a stream which would be a frequent subject of dispute as to rights.

RIVAROL, ANTOINE DE (1753-1801), French writer and epigrammatist, was born at Bagnols in Languedoc on the 26th of June 1753, and died at Berlin on the 11th of April 1801. It seems that his father was an innkeeper but a man of cultivated tastes. The son assumed the title de comte de Rivarol, and asserted his connexion with a noble Italian family, but his enemies said that the name was really Riverot, and that the family was not noble. After various vicissitudes he appeared in Paris in 1777. After winning some academic prizes, Rivarol distinguished himself in the year 1784 by a treatise Sur l’universalité de la langue française, and by a translation of the Inferno. The year before the Revolution broke out he, with some assistance from a man of similar but lesser talent, Champenetz, compiled a lampoon, entitled Petit Almanach de nos grands hommes pour 1788, in which some writers of actual or future talent and a great many nobodies were ridiculed in the most pitiless manner. When the Revolution developed the importance of the press, Rivarol once took up arms on the Royalist side, and wrote in the Journal des débats, the Correspondance littéraire (1792-1819) and the Actes des Apôtres de Jean Gabriel Peltier (1770-1825). But he emigrated in 1792, and established himself at Brussels, whence he removed successively to London, Hamburg and Berlin. Rivarol has had no rival in France except Piron in sharp conversational sayings. These were mostly ill-natured, and mostly have a merely local application. Their brilliancy, however, can escape no one. His brother, Claude François (1762-1848), was also an author. His works include Ispan, ou le fatalisme (1795), a novel; Le Véridique (1827), comedy; Essai sur les causes de la révolution française (1827).

The works of Antoine de Rivarol were published in five volumes (Paris, 1805): selections (Paris, 1858) with introductory matter by Sainte-Beuve and others, and that edited in 1862 (2nd ed., 1880) by M. de Lescure, may be specified. See also M. de Lescure’s Rivarol le société française pendant la révolution et l’émigration (1882), and Le Breton’s Rivarol, sa vie, ses idées (1895).

RIVE-DE-GIER, a town of east-central France, in the department of Loire, 14 m. E.N.E. of St Étienne, on the railway to Lyons. Pop. (1906) 15,538.

Situated on the Gier and the Canal de Givors, it is principally dependent on the coal industry, giving its name to a coal-basin which is a continuation of that of St Étienne. It has glass works, the products of which are celebrated on account of the fineness and purity of the sand found on the banks of

* Louis René Quantin de Richebourg, Chevalier de Champenetz (1760-1794), died on the scaffold. He is not to be confused with Louis Pierre, marquis de Champenetz, governor of the Tuileries in 1789, who escaped in 1792 through the protection of Mme. Elliott, mistress of the duc d’Orléans.

Features: L. R. Farnell, The Cults of the Greek States (1896-1907); A. Moret, Le Ritus du culte divin journalier en Egypte (1902); A. de Marchi Il culto privato di Roma antica (1902).
the Rhône and the Saône. There are also iron and steel works where iron goods and ironmongery of all kinds are manufactured.

Rive-de-Gier is a place of some antiquity, as appears from remains of Gallo-Roman buildings, and mosaics and coins found at various times. In the time of Henry IV. the working of the mines had already given to the locality a measure of importance.

RIVER, any considerable stream of water flowing in a defined channel. The origin and subsequent formation of rivers and the valleys along which they flow are considered under GEOGRAPHY, § Principles of Geography, and GEOLOGY, § viii. The word “river” is an adaptation of the O. Fr. rivère (mod. rivière), which descends through Med. Lat. rīvera, Low. Lat. ripāria, in the sense of river-bank and river, from ripa, bank. The Latin for a stream or river is rīvus, whence rivulās, a small stream, Eng. “rivulet,” which is, therefore, distinct in origin from “river,” though probably the sense of rīvus influenced the Med. Lat. rīvera. The etymology of rīvus and ripa is disputed; some scholars refer both to the root ri-, to drop, flow; others take ripa to be from the root seen in Gr. ἱπάτης, to tear, English “rive,” the sense being a broken cliff or steep bank.

RIVER BRETHREN, the name of a group of three Christian communities in the United States of America, descended from Swiss settlers near the Susquehanna river in Pennsylvania in 1750. The first pastor was Jacob Engle, who became head of the community in 1770. Their system is based on literal obedience to the commands of the New Testament, and they have points of similarity both with the Mennonites and with the Dunkards. They practise foot-washing and baptism by trine immersion; are strict sabbattarians and simple in their manner of life. The three branches are: (1) The Brethren in Christ, who are the most elaborately organized and are numerous in Ohio, Pennsylvania and Kansas; they have also formed churches in New York and in Canada, and missions in South Africa, India and Texas. In 1905 they had 174 ministers, and 65 churches with 3675 communicants. (2) The Old Order, or Yorker Brethren, consists of a small body which separated from the main body in 1843 and maintained more strictly the original practice. They are found specially in York county, Pennsylvania (whence the name “Yorkers”). In 1909 they had 24 ministers, 9 churches, and 423 communicants. (3) The United Zion’s Children date from 1853, when a small body left the parent communion on minor questions of administration. They had in 1909 22 ministers and 28 churches with 749 communicants, all in Pennsylvania.

RIVER ENGINEERING. Before undertaking works for the improvement of rivers, either with the object of mitigating the effects of their inundations, or for increasing and extending their capabilities for navigation, it is most important that their physical characteristics should be investigated in each case, for these vary greatly in different rivers, being dependent upon the general configuration of the land, the nature of the surface strata and the climate of the country which the rivers traverse.

Physical Characteristics of Rivers

The size of rivers above any tidal limit and their average fresh-water discharge are proportionate to the extent of their basins, and the amount of rain which, falling over these basins, reaches the river channels in the bottom of the valleys, by which it is conveyed to the sea.

River Basins.—The basin of a river is the expanse of country, bounded by a winding ridge of high ground, over which the rainfall flows down towards the river traversing the lowest part of the valley; whereas the rain falling on the outer slope of the encircling ridge flows away to another river draining an adjacent basin. River basins vary in extent according to the configuration of the country, ranging from the insignificant drainage-areas of streams rising on high ground very near the coast and flowing straight down into the sea, up to immense tracts of great continents, when rivers, rising on the slopes of mountain ranges far inland, have to traverse vast stretches of valleys and plains before reaching the ocean. The size of the largest river basin of any country depends on the extent of the continent in which it is situated, its position in relation to the billy regions in which rivers generally rise and the sea into which they flow, and the distance between the source and the outlet of the river draining it.

Great Britain, with its very limited area, cannot possess large river basins, its largest being that of the Thames with an area of 5244 sq. m. Even on the mainland of Europe, river basins augment in extent on proceeding eastwards with the increasing width of the continent; in France the largest basin is that of the Loire with an area of 45,000 sq. m., while the Rhine has a basin of 86,000 sq. m. with a length of 800 m., the Danube a basin of 312,000 sq. m. with a length of 1700 m., and the Volga a basin of 563,000 sq. m. with a length of 2000 m. The more extensive continents of Asia, Africa and North and South America possess still larger river basins, the Obi in Siberia having a basin of about 1,300,000 sq. m. and a length of 3200 m., the Nile a basin of 5,500,000 sq. m. with a length of over 4000 m., and the Mississippi, flowing from north to south, having a basin of 1,244,000 sq. m. and a length of 3800 m. The vast basin of the Amazon is 2,250,000 sq. m., is due to the chain of the Andes almost bordering the Pacific coast-line, so that the river rising on its eastern slopes has to traverse nearly the whole width of South America at its broadest part before reaching the Atlantic Ocean.

Available Rainfall.—The rainfall varies considerably in different localities, both in its total yearly amount and in its distribution throughout the year; also its volume fluctuates from year to year. Even in small river basins the variations in rainfall may be considerable according to differences in elevation or distance from the sea, ranging, for instance, in the Severn basin, with an area of only 4350 sq. m., from an average of under 30 in. in the year to over 80 in. The proportion, moreover, of the rain falling on a river basin which actually reaches the river, or the available rainfall in respect to its flow, depends very largely on the nature of the surface strata, the slope of the ground and the extent to which it is covered with vegetation, and varies greatly with the season of the year. The available rainfall has, indeed, been found to vary from 75% of the actual rainfall on impermeable, bare, sloping, rocky strata, down to about 15% on flat, very permeable soils.

Fall of Rivers.—The rate of flow of rivers depends mainly upon their fall, though where two rivers of different sizes have the same fall, the larger river has the quicker flow, as its retardation by friction against its bed and banks is less in proportion to its volume than that of the smaller river. The fall of a river corresponds approximately to the slope of the country it traverses; and as rivers rise close to the highest part of their basins, generally in hilly regions, their fall is rapid near their source and gradually diminishes, with occasional irregularities, till, in traversing plains along the latter part of their course, their fall usually becomes quite gentle. Accordingly, in large basins, rivers in most cases begin as torrents with a very variable flow, and end as gently flowing rivers with a comparatively regular discharge.

Variations in the Discharge of Rivers.—The irregular flow of rivers throughout their course forms one of the main difficulties in devising works, either for mitigating inundations or for increasing the navigable capabilities of rivers. In tropical countries, subject to periodical rains, the rivers are in flood during the rainy season and have hardly any flow during the rest of the year; whilst in temperate regions, where the rainfall is more evenly distributed throughout the year, evaporation causes the available rainfall to be much less in hot summer weather than in the winter months, so that the rivers fall to their low stage in the summer and are very liable to be in flood in the winter. In fact, with a temperate climate, the year may be divided into a warm and a cold season, extending from May to October and from November to April respectively; the rivers are low and moderate floods are of rare occurrence during the first period, and the rivers are high and subject to occasional heavy floods after a
considerable rainfall during the second period in most years. The only exceptions are rivers which have their sources amongst mountainous cliffs, and discharge their floodwaters in the summer from the melting of the snows, and ice, as exemplified by the Rhone above the Lake of Geneva, and the Arve which joins it below. But even these rivers are liable to have their flow modified by the influx of tributaries subject to different conditions, so that the Rhone below Lyons has a more uniform discharge than most rivers, as the summer floods of the Arve are counteracted to a great extent by the low stage of the Saône flowing into the Rhone at Lyons, which has its floods in the winter when the Arve on the contrary is low.

Transportation of Materials by Rivers.—Another serious obstacle encountered in the improvement of rivers consists in the large quantity of detritus brought down by them in flood-time, derived mainly from the disintegration of the surface-layers of the hills and slopes in the upper parts of the valleys by glaciers, frost and rain. The power of a current to transport materials varies with its velocity, so that torrents with a rapid fall near the sources of rivers can carry down rocks, boulders and large stones, which are by degrees ground to attrition in their onward course, into shingle, gravel, sand, and silt, simultaneously with the gradual reduction in fall, and, consequently, in the transporting force of the current. Accordingly, under ordinary conditions, most of the materials brought down from the high lands by the torrential water-courses are carried forward by the main river to the sea, or partially strewn over flat alluvial plains during floods; and the size of the materials forming the bed of the river or borne along by the stream is gradually reduced on proceeding seawards, so that in the Po, for instance, pebbles and gravel are found for about 140 m. below Turin, sand along the next 100 m., and silt and mud in the last 110 m. When, however, the fall is largely and abruptly reduced, as in the case of rivers emerging straight from mountainous slopes upon flat plains, deposit necessarily occurs, from the materials being either too large or too great in volume to be borne along by the enfeebled current; and if the impeded river is unable to spread this detritus over the plains, its bed becomes raised by deposit, causing the river in flood-time to rise to a higher level. The materials, moreover, which are carried in suspension or rolled along the bed of the river to the sea, tend to deposit when the flow of the river slackens and is finally brought to rest on encountering the great inert mass of the sea, especially in the absence of a tide and any littoral current, and this is the cause of the formation of deltas with their shallow outlets, barring the approach to many large rivers.

Influence of Lakes on Rivers.—Sometimes a peculiar depression along part of a valley, with a rocky barrier at its lower end, causes the formation of a lake in the course of the river flowing down the valley. The intervention of a lake makes the river, on entering at the upper end, deposit all the materials with which it is charged in the still waters of the lake; and it issues at the lower end as a perfectly clear stream, which has also a very regular discharge, as its floods, in flowing into the lake, are spread over a large surface, and so produce only a very slight raising of the level. This effect is illustrated by the Rhone. After the Rhone enters the Lake of Geneva as a very turbid, torrential, glacier stream, and emerges at Geneva as a sparkling, limpid river with a very uniform flow, though in this particular case the improvement is not long maintained, owing to the confluence a short distance below Geneva of the large, rapid, glacial river, the Arve.

The influence of lakes on rivers is, indeed, wholly beneficial, in consequence of the removal of their burden of detritus and the regulation of their flow. Thus the Neva, conveying the outflow from Lake Ladoga to the Baltic, is relieved by the lake from the detritus brought down by the rivers flowing into the lake; and the Swine outlet channel of the Oder into the Baltic is freed from sediment by the river having to pass through the Stettiner Haff before reaching its mouth. The St Lawrence, again, deriving most of its supply from the chain of Great Lakes of North America, possesses a very uniform flow.

River Channels.—The discharge of the rainfall erodes the beds of rivers along the lowest parts of the valleys; but floods occur too intermitently to form and maintain a channel large enough to contain the flow. A river channel, indeed, generally suffices approximately to carry off the average flow of the river, which, whilst comprising considerable fluctuations in volume, furnishes a sufficiently constant erosive action to maintain a fairly regular channel; though rivers having soft beds and carrying down sediment erode their beds during floods and deposit alluvium in dry weather. As the velocity of a stream increases with its fall, the size of a channel conveying a definite average flow varies inversely with the fall, and the depth inversely with the width. A river channel, accordingly, often presents considerable irregularities in section, forming shallow rapids when the river flows over a rocky barrier with a considerable fall, and consisting of a succession of pools and shoals when the bed varies in compactness and there are differences in width, or when the river flows round a succession of bends along opposite banks alternately.

A river flowing through a flat alluvial plain has its current very easily deflected by any chance obstruction or by any difference in hardness of the materials; and generally follows a winding course, which tends to be intensified by the erosion of the concave banks in the bends from the current impinging against them in altering its direction round the curves. Sometimes also a large river, bringing down a considerable amount of detritus, shifts its course from time to time, owing to the obstruction produced by banks of deposit, as exemplified by the Po in traversing the portion of the Lombardy plains between Casale and the confluence of the Ticino.

Floods of Rivers.—The rise of rivers in flood-time depends not merely on the amount of the rainfall, but also on its distribution and the nature of the strata on which it falls. The upper hilly part of a river basin consists generally of impermeable strata, sometimes almost bare of vegetation; and the rain flowing quickly down the impervious, sloping ground into the water-courses and tributaries feeding the main river produces rapidly rising and high floods in these streams, which pass down on the cessation of the rain. The river Marne, draining an impermeable part of the Upper Seine basin, is subject to these sudden torrential floods in the cold season, as illustrated by a diagram of the variations in height of the river at St Dizier from November to March 1903–4 (fig. 2). On the contrary, rain falling on permeable strata takes longer in reaching the rivers; and the floods of these rivers rise more gradually, are less high, continue longer and subside more slowly than in rivers draining impervious strata, as indicated by the diagram of the Little Seine at Nogent during the same period, which has a permeable basin (fig. 1). A main river fed by several tributaries, some from impermeable and others from permeable strata, experiences floods of a mixed character, as shown by the diagram of the same floods in 1903–4 of the Seine at Paris, below the confluence of the torrential Marne and Yonne, where the floods of the gently flowing Upper Seine and other tributaries with permeable basins also contribute to the rise of the river (fig. 3).

High floods, produced by a heavy rainfall on land already sodden by recent rains at a period of the year when evaporation is inactive, and especially by rain falling on melting snow. A fairly simultaneous rainfall over the greater part of a moderately sized river basin is a tolerably common occurrence; and under such conditions, the floods coming from the torrential tributaries reach their maximum height and begin to subside before the floods from the gently flowing tributaries attain their greatest rise. Exceptional floods, accordingly, only occur in a main river when a heavy rainfall takes place at such periods over different parts of the basin that the floods of the various tributaries coincide approximately in attaining their maximum at certain points in the main river.

Mitigation of Floods and Protection from Inundations.—As the size of the channel of a river is generally quite inadequate to carry down the discharge of floods, the river overflows its
banks in flood-time and inundates the adjacent low-lying lands to an extent depending upon the level of the ground and the volume and height of the flood. An enlargement of the bed of the river, principally by deepening it, in order to increase its discharging capacity sufficiently to prevent inundations, is precluded by the cost, and also, in rivers bringing down sediment, by the large deposit that would take place in the enlarged channel from the reduction in the velocity of the current when the flood begins to subside. Where, however, the depth of a tidal river has been considerably increased by dredging for the extension of its sea-going trade, the enlargement of its channel and the lowering of its low-water line have greatly facilitated the passage of land floods from the river above for some distance up, and consequently reduced their height; for instance, the Glasgow quays along the deepened Clyde are no longer subject to inundation, and the lands and quays bordering the Tyne have been relieved from flooding for nearly 10 m. above Newcastle by the deepening of the river from Elswick to the sea (fig. 18).

Sometimes works are carried out in a river valley for diminishing the height of floods by delaying the discharge of part of the rainfall into the main river; whilst others are designed to increase the discharging efficiency of the river channels. In certain cases, moreover, it is very important to restrict or to prevent the inundation of some riparian districts by embankments; and occasionally low-lying lands are so unfavourably situated that pumping has to be resorted to for the removal of their drainage waters.

**Works in River Valleys for diminishing Floods.**—Rain falling on bare, impervious, hilly slopes rapidly flows into the nearest water-course, carrying with it any loose soil or disintegrated materials met with in its rush down the ravines, thereby intensifying the torrential character of the river, increasing the height of its floods and adding to the sediment obstructing its course to the sea. By encouraging the growth of vegetation and restricting its use for pasturage, and by planting trees on the mountain slopes, which have often been denuded of their natural covering by the reckless clearing of forests, the flow of the rain off the slopes is retarded; the soil, moreover, is bound together by the roots of the plants, and the surface strata are protected from disintegration by the covering of grass and leaves, so that the amount of detritus carried down into the river is greatly reduced.

Proposals have sometimes been made to reduce the height of floods in rivers and restrict the resulting inundations by impounding some of the flood discharge by the construction of one or more dams across the upper valley of a river, and letting it out when the flood has passed down. This arrangement, however, is open to the objection that in the event of a second flood following rapidly on the first, there might not be time to empty the reservoir for its reception. The cost, moreover, of the formation of such reservoirs could rarely be justified merely for the purpose of reducing the flood-level along an ordinary river valley. Nevertheless, when this provision against floods can be combined with the storage of water-supply for a town, it becomes financially practicable. Thus two masonry dams erected across the narrow valley of the river Furens, a torrential tributary of the Loire, form two reservoirs for the supply of the town of St Etienne, in which the water is kept down several feet below the full level in order to provide for the reception of the surplus flood-waters, and thereby protect St Etienne from inundation. Storage reservoirs also, formed solely for water-supply or irrigation, provided adequate compensation water is discharged from them during dry weather, are advantageous, like lakes, in neutralizing the flow of the flood below.

When a river flowing through flat plains has a very small fall, it requires a proportionately large channel to carry away the drainage waters of the valley; and, accordingly, the low-lying lands bordering the river are very subject to inundations if the rainfall over the higher ground is allowed to flow straight down into the bottom of the valley. By intercepting, however, the flow off the high parts of the valley in small channels excavated along the slopes, termed “catch-water drains,” the ample fall available from this higher elevation can be utilized for conveying the flow farther down the valley; and the congested river is thereby relieved for a certain part of its length from the rainfall over the higher ground.

**Methods of increasing the Discharging Efficiency of River Channels.**—The discharging efficiency of a river within the limits of its bed depends on the fall and the cross-section of the channel. The only way of increasing the fall is to reduce the length of the channel by substituting straight cuts for a winding course. This involves some loss of capacity in the channel as a whole, and in the case of a large river with a considerable flow it is often necessary to maintain a strong outflow of the surplus of the current to enable the banks and form again a sinuous channel. Even if the cut is preserved by protecting the banks, it is liable to produce changes, shoals and a raising of the flood-level in the channel just below its termination. Nevertheless, where the available fall is exceptionally small, as in lands originally reclaimed from the sea, such as the English fen districts, and where, in consequence, the drainage is in a great measure artificial, straight channels have been formed for the rivers; and on account of the importance of preserving these fertile, low-lying lands from inundation, additional straight channels have been provided for the discharge of the rainfall, known as drains in the fens. Except where a town is exposed to inundations, a considerable modification of the course of a river and an enlargement of its channel do not produce a reduction in the damage from its floods commensurate with the expenditure involved.

The removal of obstructions, whether natural or artificial, from the bed of a river furnishes a simple and efficient means of increasing the discharging capacity of its channel, and, consequently, of lowering the height of floods; for every impediment to the flow, in proportion to its extent, raises the level of the river above it so as to produce the additional artificial fall necessary to convey the flow through the restricted channel, thereby reducing the total available fall. Accidental obstructions, brought down by floods, such as trunks of trees, boulders and accumulations of gravel, require to be periodically removed. In the absence of legal enactments for
conservancy of rivers, numerous obstructions have in many cases been placed in their channel, such as mining refuse, sluice-gates for mills, fish-traps, unduly wide piers for bridges and solid weirs, which impede the flow and raise the flood-level. Stringent prohibitions with regard to refuse, the enlargement of sluice-ways and the compulsory raising of their gates for the passage of floods, the removal of fish-traps which are frequently blocked up by leaves and floating rubbish, a reduction in the number and width of the piers of bridges when rebuilt, and the substitution of movable weirs for solid weirs, greatly facilitate the discharge of a river, and consequently lower its flood-level.

**Prediction of Floods in Rivers.**—By erecting gauges in a fairly large river and its tributaries at suitable points, and keeping continuous records for some time of the heights of the water at the various stations, the rise of the floods in the different tributaries, the periods they take in passing down to definitive stations on the main river, and the influence they severally exercise on the height of the floods at these places, are ascertained. With the help of these records, by observing the times and heights of the maximum rise of a particular flood at the stations on the various tributaries, the time of arrival and height of the top of the flood at any station on the main river can be predicted with remarkable accuracy two or more days beforehand. By telegraphing these particulars about a high flood to places on the lower river, the weir-keepers are enabled to open fully beforehand the movable weirs for the passage of the flood, and the riparian inhabitants receive timely warning of the impending inundation.

**Embankments along Rivers to prevent Inundations.**—Where portions of a riverside town are situated below the maximum flood-level, or when it is important to protect land adjoining a river from inundations, the overflow of the river must be confined within continuous embankments on both sides. By placing these embankments somewhat back from the margin of the river-bed, a wide flood-channel is provided for the discharge of the river directly it overflows its banks, whilst leaving the natural channel unaltered for the ordinary flow. Low embankments may be sufficient where only exceptional summer floods have to be excluded from meadows. Occasionally the embankments are raised high enough to retain the floods during most years, whilst provision is made for the escape of the rare exceptionally high floods at special places in the embankments, where the scour of the issuing current is guarded against, and the inundation of the adjoining land is least injurious. In this manner, the increased cost of embankments raised above the highest flood-level of rare occurrence is saved, and the danger of breaches in the banks from an unusually high flood-rise and rapid flow, with their disastrous effects, is avoided. Both the above methods afford the advantage of relieving the embanked channel of some of the sediment deposited in it by the confined flood-waters, when the surplus flow passes over the embankments.

When complete protection from inundations is required, the embankments have to be raised well above the highest flood-level, after allowing for the additional rise resulting from the confinement of the flood within the embankments, instead of spreading over the low-lying land; and they have to be made perfectly watertight and strong enough to resist the water-pressure and current of the highest floods. The system has been very extensively adopted where large tracts of fertile alluvial land below flood-level stretch for long distances away from the river. Thus the fens of Lincolnshire, Cambridgeshire and Norfolk are protected from inundations by embankments along their rivers and drains; a great portion of Holland is similarly protected; and the plains of Lombardy are shut off from the floods of the Po by embankments along each side of the river for a distance of about 265 m., extending from Cornale, 80 m. below Turin, to its outlet.

The system has been developed on a very extensive scale along the alluvial valley of the Mississippi, which is below the high flood-level of the river from Cape Girardeau, 45 m. above Cairo, to the Gulf of Mexico, and has a length of 600 m. in a straight line with a width ranging between 20 and 80 m., and an area of 29,790 sq. m. These embankments, having been begun by the French settlers in Louisiana, are called levees, and have a total length of 1,900 m. The levees do not completely screen the country behind them, as they are not quite continuous and are not always strong enough to withstand the water-pressure of high floods, which have at Vicksburg a maximum rise of 99 ft. above the lowest stage of the river, causing great loss of life and property. Wherever the height of the flood-waters through the opening, which is much more damaging to the land in the neighbourhood of the breach than a gradual inundation. Moreover, the velocity of the outflowing water is greatly increased by the large sluices and great plains for some distance away from the river, owing to the raising of the ground nearest the river by the gradual deposit of layers of sediment from the flood-waters when they begin to overflow the river banks. The levees on the Mississippi are breached in weak places every year during the spring floods, and are liable to be destroyed along considerable lengths by the rapid erosion resulting from their being overtopped by exceptional floods at intervals of about ten years; and in places they are undermined and overthrown by changes in the course of the river from the caving-in of concave banks at bends, necessitating reconstruction some distance back from the river at points thus threatened. When towns have been established below the level of a river, the embankments are used for the Mississippi and Szegedin on the Theiss in Hungary, the channel of the river should be improved to facilitate the passage of floods past the town. The town also must be enclosed within very solid embankments, the height of which is decided by obviating the contingency of an exceptional flood, or a gradually raised flood-level, overtopping the protecting bank at a low part, leading to an inevitable breach and a catastrophe such as overwhelmed the lower part of Saxony in 1887.

**Effect of Embankments in raising the River Bed.**—A most serious objection to the formation of continuous, high embankments along rivers bringing down considerable quantities of detritus, especially near a part where their fall has been abruptly reduced by descending from mountain slopes to alluvial plains, is the danger of their bed being raised by deposit, producing a rise in the flood-level, and necessitating a raising of the embankments if inundations are to be prevented. Longitudinal sections of the Po taken in 1874 and 1901 show that its bed was materially raised in this period from the confluence of the Ticino to below Caranella, in spite of the clearance of sediment effected by the rush through breaches; and therefore the completion of the embankments, together with their raising, would only eventually aggravate the injuries of inundations they have been designed to prevent, as the escape of floods from the raised river must sooner or later occur.

The periodic devastating floods of the Hwang Ho or Yellow River in China are due to the raising of the bed of its embanked channel by detritus brought down from the hills, followed by the raising of the banks, whereby the river is forced to flow above the level of the plains. When the river was first embanked, a considerable space was left between it and its banks on each side, which allowed for deviations in the channel, and also afforded a fair area for the deposit of detritus away from its bed, and a good width for the discharge of floods. Later, however, in order to appropriate these areas for other purposes, regulation works were undertaken to confine the river to certain definite channels on either side of the embankments and exposed to every flood, lines of inner embankments were formed close to the river, thereby greatly confining the flood-waters, and, consequently, raising the flood-level of the river, but producing the necessary drainage by merely a moderate change in position of the river channel. This reckless policy of securing additional land regardless of consequences has greatly contributed to the more frequent occurrence of great floods. An additional rise of 3 ft. has resulted in the vast volume of pent-up flood-waters through breaches in the banks, which descend with torrential violence upon the plains below, causing great destruction of life and property.

**Protection of Vessels during Floods.**—On large open rivers, where vessels during high floods are exposed to injury from
large floating débris and ice floes, shelter can be provided for them in refuge ports, formed in a recess at the side under the protection of solid jetty or embankment constructed in the river parallel to the bank, these ports being closed against floods at their upper end and having their entrance at the lower end facing down-stream. Many such ports have been provided on several German and North American rivers; where the port, being near a town, is lined with quay walls, it can also be used for river traffic, a plan adopted at the refuge port on the Main just below Frankfurt (fig. 8).

Regulation of Rivers for Navigation.

As rivers flow onward towards the sea, they experience a considerable diminution in their fall, and a progressive increase in width until they attain, owing to the successive influx of their various tributaries, a radius of action which makes them suitable for navigation. Eventually, large rivers, under favourable conditions, often furnish important natural highways for inland navigation in the lower portion of their course, as, for instance, the Rhine, the Danube, and the Mississippi; and works are only required for preventing changes in the course of the stream, for regulating its depth, and especially for fixing the low-water channel and concentrating the flow in it, so as to increase as far as practicable the navigable depth at the lowest stage of the water-level. Regulation works for increasing the navigable capabilities of rivers can only be advantageously undertaken in large rivers with a moderate fall and a fair discharge at their lowest stage: for with a large fall the current presents a great impediment to up-stream navigation, and there are generally great variations in water-level, and, when the discharge becomes very small, it is impossible to maintain a sufficient depth of water in the low-water channel.

Removal of Shoals.—The possibility of securing uniformity of depth in a river by the lowering of the shoals obstructing the channel depends upon the nature of the shoals. A soft shoal in the bed of a river is due to deposit from a diminution in velocity of flow, produced by a reduction in fall and by a widening of the channel, or to a loss in concentration of the scour of the main current in passing over from one concave bank to the next on the opposite side. The lowering of such a shoal by dredging merely effects a temporary deepening in the bed of the stream, and the shoal will soon reappear, causing productions of the same kind. The removal, moreover, of the rocky obstructions at rapids, though increasing the depth and equalizing the flow at these places, produces a lowering of the river above the rapids by facilitating the efflux of water in the same manner as temporary local falls or the temporary deepening of the bed by the closing of a side branch of the river. Where, however, narrow rocky reefs or other hard shoals stretch across the bottom of a river and present obstacles to the erosion by the current of the soft materials forming the bed of the river above and below, their removal may prove a permanent improvement by enabling the river to deepen its bed by natural scour.

The deepening of the bed of a non-tidal river along a considerable length by dredging merely lowers the water-level of the river during the low stage; and though this deepening facilitates the passage of floods in the first instance, it does not constitute a permanent improvement even in this respect, for the deposit of the detritus brought down by the river as the floods abate soon restores the river to its original condition. It is impossible to obstruct and divert the low-stage channel of a river at its low stage, as in parts of the Mississippi below Cairo, it has been found possible before the river has fallen to its lowest level to form a channel through sand-banks, with the aid of suction dredgers, wide, by suction dredgers or water-jets (see DREDGING), which discharge the sand through floating tubes into a part of the river away from the channel; and the navigation can thus be maintained throughout the sand-banks. Though, however, these channels across the shoals, connecting the deeper parts of the river, can be easily kept open on the Mississippi till the return of the floods, they are obliterated by the current, and have to be dredged out again afresh every year on the abatement of the floods.

Regulation of the Low-Water Channel.—The capability of a river to provide a water-way for navigation during the summer or throughout the dry season depends upon the depth that can be secured in the channel at the lowest stage. Owing to the small discharge and deficiency in scour during this period, it is important to restrict the width of the low-water channel, and concentrate the flow in it, and also to fix its position so that, forming the deepest part of the bed along the line of the strongest current, it may be scoured out every year by the floods, instead of remaining an undefined and shifting channel. This is effected by closing subsidiary low-water channels with dikes across them, and narrowing the channel at the low stage by low-dipping cross dikes extended from the river banks down the slope, and pointing slightly up-stream so as to direct the water flowing over them into a central channel (figs. 4 and 5). The contraction also of the channel is often still more effectually accomplished at some parts, though at a greater cost, by low

longitudinal dikes placed along either side of the low-water channel, some distance forward from the banks but connected with them generally at intervals by cross dikes at the back to prevent the current from scouring out a channel behind them during floods (figs. 4 and 6). By raising these dikes only slightly above the surface of the bed of the river, except where it is expedient to produce accretion for closing an old disused channel or rectifying the course of the river, the capacity of the channel for discharging floods is not affected; for the slight obstruction to the flow produced by the dikes at the sides is fully compensated for by the deepening of the low-water channel in the central course of the river.

This system of obtaining a moderate increase in depth during the low stage of a river, whilst leaving the river quite open for navigation, has been adopted with satisfactory results on several large rivers, of which the Rhone, the Rhine and the Mississippi furnish notable examples. Regulation works were preferred on the Rhone to canalization from Lyons nearly to its outlet, in spite of its large fall, which reaches in some places 1 in 250, on account of the considerable quantities of shingle and gravel carried down by the river; the comparative regularity of the discharge, owing to the flow being derived from tributaries having their floods at different times of the year, has aided the effects of the works, which have produced an increase of about 3½ ft. in the available navigable depth below Lyons at the lowest water-level. Owing, however, to the unfavourable natural condition of the river, the depth does not exceed 6 ft. at this stage, and the maximum capacity of the channel is limited to up-stream navigation. The Rhine is much better adapted for improvement by regulation works than the Rhone, for it has a basin more than double the area of the Rhone basin, and its fall does not exceed 3½ ft. per mile up to Strasbourg and 2½ ft. per mile through the rocky defile from Bingen to Kauh, and is much less along most of the length below Strasbourg. These works systematically carried out in wide shallow reaches between the Dutch frontier and Mainz, aided by dredging where necessary, have secured a navigable depth at the low stage of the river of 10 ft. from the frontier to Cologne, 8½ ft. from Cologne to Kaub, and 6½ ft. through the rocky defile up to Bingen, beyond which the same depth is maintained up to Philippstorf, 273 m. above Mannheim. Works, moreover, are in progress by which it is anticipated that the minimum depth of 6½ ft. will be extended up to Strasbourg by 1916. The Mississippi also, with its extensive basin and its moderate fall in most parts, is well suited for having its navigable depth increased
by regulation works, which have been carried out below St. Paul in shallow and shifting reaches, with the object of obtaining a minimum navigable depth during the low stage of 6 ft. along the upper river from St. Paul to St. Louis just below the confluence of the Missouri, and from there to Cairo, at the mouth of the Ohio. Various materials are used for the regulation works according to the respective conditions and the materials available in the locality. On the Rhone below Lyons with its rapid current, the dikes have been constructed of rubble-stone or pitching on the face, with a rubble mound forming the toe exposed to the current; but occasionally fascines are employed in conjunction with stone or simple rubble mounds. The dams closing subsidiary channels on the Mississippi are almost always constructed of fascines wriggled with stone; but whereas the regulating dikes on the upper river are usually similar in construction, a common form for dikes in the United States consists of two parallel rows of piles filled in between with brushwood or other materials not affected by water, and protected at the sides from scour by an apron of fascines and stone. Other forms of dikes sometimes used are timber cribbs filled with stone, single rows of cribbing, and other piles of the same. Dikes composed of piles supporting thin curtains of brushwood for promoting sitting at the sides, and occasionally rubble-stone in places needing special protection.

PROTECTING AND EASING BENDS.—Unless the concave banks of a river winding through wide, alluvial plains are protected from the scour of the current, the increasing curvature presents serious impediments to navigation, sometimes eventually becoming so intensified that the river bed may become short-cut across the narrow strip of land at the base of the loop it has formed. This, however, produces considerable changes in the channel below, and disturbances in the navigable depth. Protection, accordingly, of concave banks is necessary to prevent excessive curvature of the channel and changes in the course of a river. On the Mississippi the very easily eroded banks are protected along their upper, steeper part by stone pitching or a layer of concrete, and below low-water level by fascine mattresses. In a short distance from St. Louis the river is rendered more uniform by a slight inclination of the water-line in crossing the pool, which serves for the discharge of the river through the ample cross-section of this part of the river bed. These variable depths can be regulated to some extent by rubble-stone or fascine mattresses placed across the bed of the pool, so as to reduce its excessive depth, but not raised high enough to interfere at all with the navigable depth. These obstructions in the pool raise the water-line towards its upper end, in order to provide the additional fall needed to effect the discharge through the pool with its diminished cross-section and this raising of the water-line increases the depth over the shoal above the pool, so that the general depth in these irregular parts of a river is rendered more uniform, with benefit to navigation.

CANALIZATION OF RIVERS.

Rivers whose discharge is liable to become quite small at their low stage, or which have a somewhat large fall, as is usual in the upper part of rivers, cannot be given an adequate depth for navigation by regulation works alone; and their ordinary summer level has to be raised by impounding the flow with weirs at intervals across the channel (see WEIR), while a lock (see CANAL AND DOCK) has to be provided alongside the weir, or in a side channel, to provide for the passage of vessels (fig. 8). A river is thereby converted into a succession of fairly level reaches rising in steps up-stream, providing a comparatively still-water navigation like a canal; but it differs from a canal in the introduction of weirs for keeping up the water-level, in the provision for the regular discharge of the river at the weirs, and in the two sills of the locks being laid at the same level instead of the upper sill being raised above the lower one to the extent of the rise at the lock, as usual on canals. Canalization secures a definite available depth for navigation; and the discharge of the river generally is ample sufficient for maintaining the impounded water-level, as well as providing the necessary water for locking. The navigation, however, is liable to be stopped during the descent of high floods, which in many cases rise above the locks (figs. 7); and it is necessarily arrested in cold climates on all rivers by long, severe frosts, and especially on the break-up of the ice.

INSTANCES OF CANALIZED RIVERS.—Many small rivers, like the Thames above its tidal limit, have been rendered navigable by canalization, and several fairly large rivers have thereby provided a good depth for vessels for considerable distances inland. Thus the canalized Seine has secured a navigable depth of 10 ft. from its tidal limit up to Paris, a distance of 136 m., and a depth of 6 ft. up to Montereau, 62 m. higher up. Regulation works for improving the river Main, from its confluence with the Rhine opposite Mainz up to Frankfort, having failed to secure a minimum depth of 3 ft. at the low stage of the river, canalization works were carried out in 1865-86 by means of five weirs in the 22 m. between the Rhine and Frankfort, and provided a minimum depth of 6 ft. (figs. 7 and 8).

RIVERS EXPOSED TO LITTORAL DRIFT.

Rivers with a small discharge flowing straight into the sea on an exposed coast are more or less obstructed at their outlet.
by drift of shingle or sand carried along the coast by the waves in the direction of the prevailing winds. When the flow falls very low in dry weather, the outlet of a river is sometimes completely closed by a continuous line of beach, any inland or tidal waters merely trickling through the obstruction; and it is only on the descent of floods that the outlet is opened out. In rivers which always have a fair fresh-water discharge, or a small fresh-water flow combined with a tidal flow and ebb, the channel sometimes has its direct outlet closed, and is deflected parallel to the shore till it reaches a weak place in the line of beach, through which a new outlet is formed; or, where the current is strong enough to keep the outlet open, a bar is formed across the entrance by the littoral drift, reducing the navigable depth.

**Jetty at River Outlets.**—The bar formed by littoral drift across the outlet of a river not charged with sediment and flowing into a tideless sea can be lowered by carrying out solid jetties on each side of the outlet across the foreshore, so as to scour the bar by continuous flow of the issuing current over it. Thus by means of jetties, aided by dredging, the depth at the entrance to the Swine mouth of the Oder has been increased from 7 ft. to 22 ft.; the approach channels to the river Pernau (fig. 9) and other Russian rivers flowing into the Baltic have been deepened by jetties, and the outlet channels of some of the rivers flowing into the Great Lakes of North America have been improved by crib-work jetties and dredging.

Where the littoral drift is powerful enough to divert the outlet of a river, as in the case of the river Yare, which at one time was driven to an outlet 4 m. south of its direct course into the sea at Yarmouth, and the river Adour in France, whose outlet, owing to the currents from its proper position, it has proved practicable to fix as well as to deepen the outlet by means of jetties (fig. 10). In such cases, violent storms of the Bay of Biscay, entailing the shifting of the bar, have to be shunted, fixed by jetties on the bar foreshore, and by an outlet guided across the foreshore and fixed in position by fascine mattress jetties (see jetty), the maintenance of the depth at the mouth by the tidal and fresh waters being aided by frequent dredging (figs. 11 and 12).

**Deltaic Outlets of Tidless Rivers.**

Large rivers heavily charged with sand and silt, when their current is gradually arrested on entering a tideless sea, deposit these materials as a constantly advancing fan-shaped shoal in front of their mouths, through which comparatively shallow diverging channels, almost devoid of fall, have to force their way in order to convey the fresh-water discharge into the sea (fig. 13). These deltaic channels deposit their burden of sediment in front of their outlets, forming bars which advance with the delta and whose rate of progress seawards and distance in front of each outlet are proportionate to the discharge of the several channels. A channel simply dredged on the bar in front of one of the outlets of a deltaic river is only maintained for a moderate period on account of the large volume of deposit continually accumulating at the outlet. Thus the channel in front of the outlet of the south-west pass of the Mississippi delta, when deepened from 13 ft. to 18 ft. over its bar by dredging many years ago, was soon filled again on the discontinuance of the dredging; whilst the depth of the outlet channel of one of the branches of the Volga delta, which was increased from 4 ft. to 8 ft., could only be maintained by regular yearly dredging.

**Parallel Jetty at Delta Outlets.**—In order to procure and maintain for some time an adequate deepening across the bar in front of the outlets of delta channels, recourse has been had to the scour of the issuing current concentrated and extended out to the bar by parallel jetties, forming prolongations seawards of the banks of the channel. The requisite conditions for the success of this system of improvement are a good depth in the sea beyond the bar, allowing of a considerable deposit of alluvium before the increased depth is interfered with, and a littoral current carrying a portion of the alluvium away from the outlet, both of which retard the progression of the delta in front of the outlet and the inevitable eventual formation of a new bar farther out. The rate of advance of a delta depends also on the proportion of solid matter contained in the river water and on the specific gravity and size of the particles of alluvium discharged into the sea; for the heavier and coarser materials, and especially those which are rolled along the bed of the channels, come first to rest. Moreover, as the larger channels of a delta bring down a larger volume of alluvium on account of their larger discharge, and as their bars form farther seawards from their outlets owing to the issuing current being less rapidly arrested in proportion to the volume discharged, the rate of advance of the
delta in front of an outlet is proportionate to the size of the channel, and the length of the jetties required for lowering the bar by scour in front of any channel is proportionate to the discharge of the channel. Consequently, the conditions are more unfavourable for the improvement of the outlets of the larger delta channels than of the smaller ones; though, on the other hand, the larger channels crossing the delta are generally more suitable for navigation on account of their size, and the natural depth over their bars is greater owing to the larger discharge.

The main branch of the Rhone, which formerly flowed into the Mediterranean and the Gulf of Foz through six mouths, was in 1852–57 concentrated in the direct eastern channel by embankments along sides, which closed all the lateral channels, and the discharge was thus increased through the eastern outlets, increased for a time the depth over bar from 43 ft. to 49 ft., but as the great volume of alluvium brought down, including an unusually large proportion of sand rolled along the bed, and thus the whole discharge was carried through the one outlet, the bar soon formed again farther out, and naturally advanced with the delta in front of the outlet more rapidly than formerly when the deposit was distributed through six divergent mouths. Accordingly, the very moderate deepening produced by gradually in the jetties not long maintained, and the average depth over the bar has not exceeded 61 ft. for many years past; the St Louis Canal was constructed to provide a deeper outlet for the navigation. This want of success was due to the selection of the wrong opening on the southern side of a southern outlet discharging into deep water in the Mediterranean and having a deep littoral current flowing across it, and also resulted from the closing of all the other outlets, whereby the whole of the deposit, as well as all the discharge, was washed in front of the badly situated eastern outlet. The southern Rouson branch was reopened in 1893 to prevent the silting-up of the outlet of the St Louis Canal.

The Danube traverses its delta in three branches, the northern one of which the southern two-thirds of the discharge of the river, is unsuitable for improvement owing to its splitting up along portions of its course into several channels, and eventually flowing into the sea through twelve mouths, all involving an additional depth of from 250 ft. annually across a shallow foreshore. The central Sulina branch was selected for improvement in 1858 in preference to the southern St George's branch, which had a more favourably situated outlet and a better channel. As the depth of the delta, on account of the much smaller expenditure required for carrying out jetties to the bar in front of the Sulina outlet, which was only half the distance from the shore of the bar of the St George's outlet, owing to the much smaller discharge of the Sulina branch. The jetties, being provisionally in face of the delta, were subsequently consolidated and somewhat extended, were finally completed in 1877. They increased the depth over the bar from an average of about 9 ft. previously to 1856 to 20 ft. in 1877, which was maintained for many years. In 1893, in a swell, the increased discharge, as well as the greater depth necessary, the wide inshore portion of the jetty channel was therefore narrowed by inner parallel jetties, and a powerful dredger was set to work in the parallel channel and outside, whereby the depth was increased to 24 ft. and the bars were thus made so mobile that a second dredger became necessary to cope with the shoaling. The somewhat small ratio of sediment to discharge in the Danube, the fineness of the greater portion of the sediment, its comparatively moderate amount owing to the small proportion of the discharge flowing through the Sulina branch, and its partial dispersion by the southerly littoral current and wave action, have prevented the rapid formation of a shoal in front of the Sulina outlet. Nevertheless, the lines of soundings are gradually advancing seawards in the line of the outlet channel, and there are signs of the formation of a new bar farther out, whilst the deposit to the south by the current and waves has deflected the deepest channel northwards. Accordingly, a prolongation of the jetties will eventually be necessary, not only for the removal of a portion of the deposit from the outlet by dredging.

The selection of the outlet of the south pass of the Mississippi delta for improvement in 1876–79 was made in 1876–79. The south-west pass possessing a larger channel and a better depth over its bar, was due, as at the Danube, to motives of economy, as the bar of the south-west pass was twice as far off from the shore as that of the south pass (fig. 13). The mattress jetty consisted of limes and limestone with large concrete blocks at their exposed ends (fig. 12), 21 & 14 ft. long, and curved southwards at their outer ends to direct the sediment-bearing current more directly at right angles to the western littoral current, increasing the discharge of the delta from 43 ft. up to 31 ft. between the jetties and out to deep water (fig. 14). The prolonged current of the river produced by the jetties as has, at the Sulina outlet, carried the main portion of the heavier sediment into fairly deep water, so that the greatest advance of the foreshore in front of the south pass has occurred in the 70-ft. line of soundings, though the shallower soundings have also advanced.

The shoaling, however, in the jetty channel necessitated its reduction in width by mattresses and spurs from 1000 ft. to 600 ft., and also dredging to maintain the stipulated central depth of 30 ft., and 26 ft. depth for a width of 200 ft., out to deep water; whilst the outer channel was deflected to the east and narrowed by the alluvium carried westwards by the littoral current and also deposited in front of the jetty outlets. Accordingly, dredging was speedily needed to straighten the channel outside and maintain its depth and width; and since the United States engineers took in hand its maintenance in 1901, the available depth of the outlet channel has been increased from 26 ft. up to 28 ft. by extensive suction dredging.

In order to provide for the increasing requirements of sea-going vessels, the dredging of a channel 35 ft. deep and 1000 ft. wide, cut from the large south-west pass outlet to deep water in the gulf, was begun at the end of 1903; and jetties of massive mattresses weighted with stone and concrete blocks have been carried about 4 miles respectively from the shore on each side of the outlet for maintaining the dredged channel (fig. 15). These works differ from the prior improvement of the south pass in the adoption mainly of suction dredging for the formation of the channel in place of our alone, so that it will be unnecessary to restrict the width of the jetty channel to secure the desired depth; whilst as the discharge through the south-west pass is rather more than three times the discharge through the south pass, and the bar is double the distance seawards of the outlet, the slightly converging jetties and the south-westerly current there (fig. 15) are placed about 5000 ft. apart at their outer ends, and have been given about twice the length of the south pass jetties. As soon as the dredging of the channel has been completed (which depends on the appropriations granted Congress) the south pass will be abandoned, and the south-west pass will form the navigable approach. Dredging will be required for preserving the depth of the outlet of the south-west pass; and when the large volume of sand and other alluvium discharged by the pass accumulates in front sufficiently to begin forming a bar farther out, an extension of the jetties will be necessary to maintain the elongated channel free from drift, and extend the scour, especially in flood-time.

**Improvement of Tidal Rivers for Navigation.**

Wheras the size of tideless rivers depends wholly on their fresh-water discharge, the condition of tidal rivers is due to the configuration of their outlet, the rise of tide at their mouth, the distance the tide can penetrate inland, and the space available for its reception. Accordingly, tidal rivers sometimes, even when possessing a comparatively small fresh-water discharge, develop under favourable conditions into large rivers in their lower tidal portion, having a much better natural navigable channel at high tide than the largest deltat rivers, as shown by a comparison of the Thames, the Humber and the Elbe with the Danube, the Nile and the Mississippi. Tidal water is, indeed, unlimited in volume; but, unlike the drainage waters which must be discharged into the sea, it only flows up rivers where there is a channel and space available for its transport.
RIVER ENGINEERING

382

by the foremost part of the flood-tide lines from the entrance to beyond Chinsura, attaining a maximum in the neighbourhood of Konmgar and Chinsura, indicative of the existence of a bore, caused by the sand-banks in the channel obstructing the advance of the flood-tide, till it has risen sufficiently in height to rush up the river as a steep, breaking wave, over coming all obstacles and producing a sudden reversal of the flow and abrupt rise of the water-level, as observed on the Severn, the Seine, the Amazon and other rivers. A bore indicates defects in the tidal channel and the navigable channel, which can only be reduced by lowering the obstructions and by the regulation of the river. No tidal river of even moderate length is ever completely filled by tidal water; for the tide has to fall at its mouth before the flood-tide has produced high water at the tidal limit, as most clearly shown in the case of a long tidal river by the Hugli tidal diagram. Every improvement of the channel, however, expedites and increases the filling of the river, whilst the volume of water admitted at each tide is further augmented by the additional capacity provided by the greater influx of the ebb, as indicated by the lowering of the low-water line.

Deepening Tidal Rivers by Dredging.—The improvement of tidal rivers mainly by dredging is specially applicable to small rivers which possess a sufficient navigable width, like the Clyde and the Tyne; for such rivers can be considerably deepened by an amount of dredging which would be quite inadequate for producing a similar increase in depth in a large, wide, river, with shoaling channels. Both the Clyde below Glasgow and the Tyne below Newcastle were originally insignificant rivers, almost dry in places at low water of spring-tides; and the earliest works on both rivers consisted mainly in regulation of the channels and increasing their navigable capacity by jetty and training works. They have, however, been brought to their present excellent navigable condition almost wholly, since 1840 on the Clyde and 1861 on the Tyne, by continuous systematic dredging, rendered feasible by the large fresh-water volume of the Clyde and the uniformity of its traffic. The Clyde has been given a minimum depth of about 22 ft. at low water of spring-tides up to Glasgow, and can admit vessels of 27 to 28 ft. draught. In the Tyne (figs. 17 and 18), it was deepened in 1902 to provide a navigable depth in the river channel at low water of 25 ft. from the sea to the docks, of 30 ft, thence to Newcastle and of 18 ft. up to Scotswood, the rise of spring-tides increasing these depths by 15 ft. In 1906 it was determined to make the channel 30 ft. deep at low water of spring-tides from the sea to the docks, and in 1908 to deepen it between the docks and Newcastle swing bridge from 20 to 25 ft., and also between the swing bridge and Derventough from 18 to 25 ft. The natural scour of these rivers has been so much reduced by such an exceptional enlargement of their channels that a considerable amount of dredging will always be required to preserve the depth attained.

Regulation and Dredging of Tidal Rivers.—Considerable improvements in the navigable condition of tidal rivers above their outlet or estuary can often be effected by regulation works aided by dredging, which, ease sharp bends, straighten their course and render their channel, depth and flow more uniform. Examples are the Nervion between Bilbao and its mouth (figs. 19 and 20), and the Weser from Bremen to Bremerhaven at the head of its estuary (figs. 21 and 22). These works resemble in principle the regulation works on large rivers with only a fresh-water discharge, previously described; but on tidal rivers the main low-water channel should alone be trained with an enlarging width seawards to facilitate the tidal influx, and the tidal capacity of the river above low water should be maintained unimpaired.

To secure a good and fairly uniform depth on a tidal river, it is essential that the flood and ebb tides should follow the same course, in order to combine their scouring efficiency, and form a single, continuous deep channel. In wide, winding reaches, however, the flood tide in ascending a river follows as direct a course as practicable; and on reaching a bend, the main flood-tide current, in being deflected from its straight course, hogs the concave bank, and, keeping close alongside the same bank beyond the bend, cuts into the shoal projecting from the convex bend of the bank higher up, forming a blind shoaling channel, as clearly indicated near the Moyapur Magazine in fig. 23, and a little below Shipgunj Point in fig. 24. This effect is due to the flood-tide losing its guidance, and consequently its concentration, at the change of curvature beyond the termination of the concave bank, where it spreads out and passes gradually over, in its direct course, to the next concave bend above along the opposite bank. The ebb tide, on the contrary, descending the river, follows the general course of the fresh-water discharge in all rivers, its main current in the Moyapur keep close along the concave bank between Ulbana and Hiraunj Point, and crossing over opposite the point to the next concave bank below (fig. 23); whilst in the James and Mary reach the main ebb-tide current runs along the concave bank in front of Nihan and Nurpur, as passes over near Hugli Point to the opposite concave bank below Gawankhali (fig. 24). The main currents, accordingly, of the flood and ebb tides in such reaches act quite independently between the bends, forming channels on opposite sides of the river and leaving a central intervening shoal.

The surveys of the two reaches of the Hugli, represented in figs. 23 and 24, having been taken in the dry season, exhibit the flood-tide channels at their deepest phase, and the ebb-tide channels in their worst and least continuous condition.

In tidal rivers the main ebb-tide current, being reinforced by...
the fresh-water discharge, generally forms the navigable channel, which is scoured out during floods. Narrowing the river between the bends to bring the two channels together would unduly restrict the tidal flow; and in a river like the Hugli dependent on the tidal influx for the maintenance of its depth for two-thirds of the year, and with channels changing with the wet and dry seasons, so that deepening by dredging in the turbid river could not be permanent, training works below low water to bring the ebb-tide current into the flood-tide channel, which latter must not be obstructed at all, offer, aided by dredging, the best prospects of improvement.

**Works at the Outlet of Tidal Rivers.**—Tidal rivers flowing straight into the sea, without expanding into an estuary, are subject to the obstruction of a bar formed by the heaping-up action of the waves and drift along the coast, especially when the fresh-water discharge is small; and the scour of the currents is generally concentrated and extended across the beach by parallel jetties for lowering the bar, as at the outlets of the Maas (figs. 11 and 12) and of the Nervion (figs. 19 and 20). In the latter case, however, the trained outlet was still liable to be obstructed by drift during north-westerly storms in the Bay of Biscay; and, except in the case of large rivers, the jetties have to be placed too close together, if the scour is to be adequate, to form an easily accessible entrance on an exposed coast. Accordingly, a harbour has been formed in the small bay into which the Nervion flows by two converging breakwaters, which provides a sheltered approach to the river and protects the outlet from drift (fig. 19), and a similar provision has been made at Sunderland for the mouth of the Wear; whilst the Tynemouth piers formed part of the original design for the improvement of the Tyne, under shelter of which the bar has been removed by dredging (fig. 17).

**Training Works through Sandy Estuaries.**—Many tidal rivers flow through bays, estuaries or arms of the sea before reaching the open sea, as, for instance, the Mersey through Liverpool Bay, the Tees through its enclosed bay, the Liffey through Dublin Bay, the Thames, the Ribble, the Dee, the Shannon, the Seine, the Scheldt, the Weser and the Elbe through their respective estuaries, the Yorkshire Ouse and Trent through the Humber estuary, the Garonne and Dordogne through the Gironde estuary, and the Clyde, the Tay, the Severn and the St Lawrence through friths or arms of the sea. These estuaries vary greatly in their tidal range, the distance inland of the ports to which they give access, and the facilities they offer for navigation. Some possess a very ample depth in their outer portions, whilst they generally become shallower towards their upper end; but dredging often suffices to remedy their deficiencies and to extend their deep-water channels. Thus the St Lawrence, which possesses an ample depth from the Atlantic up to Quebec, has been rendered accessible for seagoing vessels up to Montreal by a moderate amount of dredging; whilst dredging has been resorted to in parts of the Thames and Humber estuaries, and on the Elbe a little below Hamburg, to provide for the increasing draught of vessels; and the Mersey bar in Liverpool Bay, about 11 m. seawards of the actual mouth of the river, has been lowered by suction dredging from a depth of about 9 ft. down to about 27 ft. below low water of equinoctial spring tides, to admit Atlantic liners at any rate of the tide.

Some estuaries, however, are so encumbered by sand banks that their rivers can only form shallow, shifting channels through them to the sea; and these channels require to be guided or fixed by longitudinal training walls, consisting of mounds of rubble stone, chalk, slag or fascines, in order to form sufficiently deep stable channels to be available for navigation. The difficulty in such works is to fix the wandering channel adequately, and to deepen it...
sufficiently by the scour produced between the training walls, without placing these walls so close together as to raise them so high as to check the tidal influx and produce accretion behind them, thereby materially reducing the volume of tidal water entering and flowing out of the estuary at each tide. The high training works in the Dee estuary, carried out in the estuary below Preston, for improving its depth and rendering it stable, was begun in 1839, and has been gradually extended at intervals; but the works have not yet been carried out to deep water, and a shifting, shallow channel still exists through the sand banks, between the end of the training walls and the sea. The high training walls adopted along the upper part of the channel enabled the upper end of the estuary on both sides to be

tide (figs. 25 and 26). The channel, however, was made too narrow between Aizer and Berville and was subsequently enlarged, and large tracts of land were reclaimed in the upper estuary. The reduction in tidal capacity by the reclamations, together with the fixing and undue restriction in width of the channel, occasioned very large accretions at the back of the lower portions of the training walls and at the sides of the estuary beyond them, and an extension of the sand banks seawards. Moreover, the channel has always remained shallow and unstable beyond the ends of the training works down to deep water near the mouth of the estuary.

Conclusions about Training Works in Estuaries.—Experience has proved that training works through sandy estuaries, by stopping the wanderings of the navigable channel, produce an increase in its depth, and, consequently, in the tidal scour for maintaining it. This scour, however, being concentrated in the trained channel, is withdrawn from the sides of the estuary, which in its natural condition is stirred up periodically by the wandering channel; and, therefore, accretion takes place in the parts of the estuary from which the tidal scour has been permanently diverted, especially where an abundance of sand from outside, put in suspension by the action of the prevalent

winds blowing into the estuary, is brought in by the flood-tide, as in the cases of the estuaries of the Dee, the Ribble, and the Seine. This accretion reduces the tidal capacity of the estuary, and, producing a diminution in the tidal volume passing through the outlet, promotes the extension of the sand banks seawards, as indicated by the difference in the outer portions of the longitudinal sections of different dates of the Weser and Seine estuaries (figs. 22 and 26). To prevent as far as possible the reduction in tidal capacity, the training walls should not be raised above low-water level than absolutely necessary to fix the channel; and the rate of enlargement of the width apart should not be less than 1 in 80 at the upper end, and should increase considerably towards the mouth of the estuary so as to form a trumpet-shaped outlet. The loss of scour in the channel resulting from this enlargement must be compensated for by dredging to attain the required depth. Training works partially carried out through an estuary have the advantage of reducing the length of shallow channel to be traversed between deep water and the entrance to the deepened river; but as these works produce no influence on the channel for any distance beyond their termination, a shallow, shifting channel is always found between the end of the trained channel and deep water. Accordingly, when training works are started at the head of a sandy estuary, provision should always be made in their design for their eventual

prolongation to deep water at the mouth of the estuary, to ensure
the formation of a stable, continuous, navigable channel. Experi-
ments with a model, moulded to the configuration of the estuary
under consideration and reproducing in miniature the tidal ebb
and flow and fresh-water discharge over a bed of very fine sand, in
which various lines of training walls can be successively inserted,1
are capable in some cases of furnishing valuable indications of the
respective effects and comparative merits of the different schemes
proposed for works which have often evoked very conflicting
opinions and have sometimes produced most unexpected results.
(L. F. V.-H.)

RIVER-HOG, a sportman’s name for the African wild pigs of
which the southern representative is known to the Boers as the
boch-vark ("bush-pig"). They constitute a genus, Potamochoerus,
nealy allied to the typical pigs of the genus Sus (see SWINE),
from which they are distinguishable by the presence in the males of a long horned ridge below the eye; while
they are further characterized by their thick coat of bristly and often brightly coloured hair, and by tufts of long
bristles at the tips of the elongated and pointed ears. The
southern P. *choeropotamus*, of southern and east Africa, is
typically a greyish-brown animal, but one of its eastern
representatives is orange-red. In north-east Africa occurs
the allied P. *johnstoni*, while in Kordofan and Abyssinia this
is in turn replaced by P. *hassama*. The most remarkable member
of the group is, however, the red river-hog, *P. porcus*, which is
a heavy, short-legged species remarkable for its bright red
colour, the great length of the ear-tufts and the white rings
round the eyes. It is a native of the great forest-tracts, ex-
tending from Senegambia, Liberia and Angola on the W.,
to Monbuttu in the E. Very noteworthy is the occurrence of a
small yellow-haired representative of the group (*P. laratus*)
in Madagascar, which evidently must have reached its present
habitat from the mainland.
(R. L.*)

RIVERINA, a large tract of pastoral country between the
rivers Murray and Darling in New South Wales, Australia.
It gives name to the see of an Anglican bishop who has his
seat at Hay. The chief towns are Deniliquin, Hay, Moulaume,
Oakey, Narrabri, and Walgett.

RIVERS, EARL, an English title held in succession by the
families of Woodville or Wydeville, Darcy and Savage. In
1299 John Rivers, or de Riparlis, was summoned to parliament
as a baron, and his son John was similarly summoned by
Edward II. The earldom was created for Sir Richard Wood-
vilie in 1406 and remained in this family until 1491. (For the
three ears of his line see below.) As borne by the Wood-
villes the title was not derived from the name of a place, but
from an ancient family name, Redvers, or Reviers, members of
this family, whose arms are quartered on the Rivers shield,
having been sometime ears of Devon.

From 1626 to his death in 1640 the earldom was held by
Thomas Darcy, Viscout Colchester, from whom it descended
by special remainder to his grandson John (c. 1610–1654),
the son of his daughter Elizabeth (d. 1651) by his marriage with Sir Thomas Savage (d. 1653), who was created Viscount Savage
in 1626. John, son Thomas (1626–1690) was the 3rd earl,
and his grandson Richard the 4th earl (see below). The title
became extinct when John, the 5th earl, died about 1715.

A new barony of Rivers, held by the family of Pitt and its
later representative, that of Pitt-Rivers, was in existence from
1776 to 1880.

RIVERS, ANTHONY WOODVILLE, or WYDEVILLE, 2ND
EARL (c. 1442–1453), statesman and patron of literature, and
author of the first book printed on English soil, was born
probably in 1442. He was the son of Richard de Wydeville
and his wife, Jacqueta de Luxembourg, duchess of Bedford.
His father was raised to the peerage in his son’s infancy, and
was made earl of Rivers in 1466. Anthony, who was knighted
before he became of age, and fought at Towton in 1461,
married the daughter of Lord Scales, and became a peer jure
wartus in 1462, two years after the death of that magnate.
Being lord of the Isle of Wight at the time, he was in 1467
appointed one of the ambassadors to treat with the duke of
Burgundy, and he exalted his office by challenging Anthony,
comte de la Roche, the bastard of Burgundy, to single fight in
what was one of the most famous tournaments of the age (see
In 1469 Anthony was promoted to be lieutenant of Calais and captain of the king’s armada, while holding other
honorary posts. His father and brother were beheaded after
the battle of Edgecot, and he succeeded in August of that year
to the earldom. He accompanied Edward in his temporary
flight to the Continent, and on his return to England had a share
in the victory of Barnet and Tewkesbury and defended London
from the Lancastrians. In 1473 he became guardian and
governor to the young prince of Wales, and for the next few
years there was no man in England of greater responsibility or
enjoying more considerable honours in the royal service.
It is now that for the first time we become aware of Lord
Rivers’s literary occupations. His mother, the duchess, died
in 1472, and his first wife in 1473; in 1475 and the following
year he went on pilgrimage to the holy places of Italy; from
this time forth there was a strong tincture of serious reflection
thrown over his character; he was now, as we learn from Caxton,
nominated “Defender and Director of the Siege Apostolic
for the Pope in England.” Caxton had in 1476 rented a shop in
the Sanctuary at Westminster, and here had set up a printing-
press. The first MS. which he undertook in London was one
sent to him by “the noble and puissant lord, Lord Antone,
Erle of Ryyvers,” consisting of a translation “into right good
and fayr Englyssh” of Jean de Teouville’s French version of a
Latin work, “a glorious fair mirror to all good Christian
people.” In 1477 Caxton brought out this book, as *Dices
and Saugens of the Philosophers*, and it is illustrous as the first
production of an English printing-press. To this succeeded
the *Moral Proverbs* of Christine de Pisan, in verse, in 1478,
and a *Cordial*, in prose, in 1479. The original productions of Lord
Rivers, and, in particular, his *Balades against the Seven Deadly
Sins*, are lost. In 1478 a marriage was arranged between him
and Margaret, daughter of Sir John Pole, 3rd Bt. of Scales,
but it was mysteriously broken off. Rivers began to perceive
that it was possible to rise too high for the safety of a subject, and
he is now described to us as one who “conceiveth well the
mutability and the unstableness of this life.” After the death
of Edward IV., he became the object of Richard III.’s peculiar
enmity, and was beheaded by his orders at Pontefract on the
25th of June 1483. He was succeeded by his brother Richard,
the 3rd and last earl of the Wydeville family, who died in
1491. Lord Rivers is spoken of by Commynes as “un tres-
gentil chevalier,” and by Sir Thomas More as “a right honour-
able man, as valiant of hand as politic in counsel.” His
protection and encouragement of Caxton were of inestimable
value to English literature, and in the preface to the *Dices*
the printer gives an account of his own relations with the
statesman which illustrates the dignity and modesty of Lord
Rivers in a very remarkable degree. Rivers was one of the purest
writers of English prose of his time.

“Memoirs of Anthony, Earl Rivers” are comprised in the *His-
torical Illustrations of the Reign of Edward the Fourth* (ed. W. H.
Black]).

RIVERS, RICHARD SAVAGE, 4TH EARL (c. 1600–1712),
was the second son of Thomas, 3rd earl; and after the death about
1680 of his elder brother Thomas, styled Viscout Colchester,
he was designated by that title until he succeeded to the
peerage. Early in life Richard Savage acquired notoriety
by his dare-devilry and dissipation, and he was, too, one of
the most conspicuous rakes in the society of the period.
After becoming Lord Colchester on his brother’s death he
entered parliament as member for Wigan in 1681 and procured
a commission in the Horseguards under Sarsfield in 1686.
He was the first nobleman and one of the first persons
who joined the prince of Orange on his landing in England,
and he accompanied William to London. Obtaining promotion
in the army, he served with distinction in Ireland and in
the Netherlands, and was made major-general in 1693 and

XXII. 13
lieutenant-general in 1702. In 1694, he succeeded his father as 4th Earl Rivers. He served abroad in 1702 under Marlborough, who formed a high opinion of his military capacity and who recommended him for the command of a force for an invasion of France in 1706. The expedition was eventually diverted to Portugal, and Rivers, finding himself superseded before anything was accomplished, returned to England, where Marlborough procured for him a command in the cavalry. The favour shown him by Marlborough did not deter Rivers from paying court to the Tories when it became evident that the Whig ascendency was waning, and his appointment as constable of the Tower in 1710 on the recommendation of Harley and without Marlborough’s knowledge was the first unmistakable intimation to the Whigs of their impending fall. Rivers now met with marked favour at court, being entrusted with a delicate mission to the elector of Hanover in 1710, which was followed by his appointment in 1711 as master-general of the ordnance, a post hitherto held by Marlborough himself. Swift, who was intimate with him, speaks of him as ‘an arrant knave’; but the dean may have been disappointed at being unmentioned in Rivers’s will, for he made a fierce comment on the earl’s bequests to his mistresses and his neglect of his friends. In June 1716, he married the 10th Earl of Oxford, Lady Macclesfield, but though his story was accepted by Dr Johnson and was very generally believed, the evidence in its support is faulty in several respects. As Rivers left no legitimate son the earldom passed on his death to his cousin, John Savage, grandson of the 2nd earl, and a priest in the Roman Catholic Church, on whose death, about 1735, all the family titles became extinct.

RIVERS, RICHARD WOODVILLE, or Wydeville, Earl (d. 1469), was a member of a family of small importance long settled at Grafton in Northamptonshire. His father, Richard Woodville, was a squire to Henry V., and afterwards the trusted servant of John of Bedford, in whose interest he was constable of the Tower during the troubles with Humphrey of Gloucester in 1425. The younger Richard Woodville was knighted by Henry VI. at Leicester in 1426. He served under Bedford in France, and after his master’s death married his widow, Jacquetta of Luxembourg. The misalliance caused some scandal, but Woodville enjoyed the king’s favour and continued to serve with honour in subordinate positions in France. He also distinguished himself at jousts in London (Chronicles of London, 146, 148). On the 4th of May 1448 Henry VI. created him Baron Rivers. His associations made him a strong Lancastrian. For some years he was lieutenant of Calais in Henry’s interest. In 1449, when stationed at Sandwich, he bought the Higham-York surrender from Sir John Dinhum, and taken prisoner with his son Anthony to the earl of Warwick at Calais. He was, however, released in time to fight for Henry VI. at Towton. Early in the reign of Edward IV. Rivers recognized that the Lancastrian cause was lost and made his peace with the new king. The marriage of his eldest daughter, Elizabeth, widow of Sir John Grey of Groby, to Edward on the 1st of May 1464, secured the fortunes of his family. Rivers was appointed treasurer on the 4th of March 1466, and a little later created earl. Elizabeth found great alliances for her younger brothers and sisters, and the Woodville influence became all-powerful at court. The power of this new family was very distasteful to the old baronial party, and especially so to Warwick. Early in 1468 Rivers’s estates were plundered by Warwick’s partisans, and the open war of the following year was aimed to destroy the Woodvilles. After the king’s defeat at Edgecote, Rivers and his second son, John, were taken prisoners at Chepstow and executed at Kenilworth on the 12th of August 1469. Rivers had a large family. His third son, Lionel (d. 1484), was bishop of Salisbury. All his daughters made great marriages: Catherine, the sixth, was the wife of Henry Stafford, 2nd duke of Buckingham (q.v.).

RIVERSIDE, a city of southern California, U.S.A., and the county-seat of Riverside county, situated on the Santa Ana river, in the Sanbernardino valley. Pop. (1890) 4683; (1900) 7073; (1910) 15,212. It is served by the Atchison, Topeka & Santa Fe, the Southern Pacific and the San Pedro, Los Angeles & Salt Lake railways. The city occupies a slope (about 800–1000 ft. above sea-level), rising toward the east is beautifully built and is a winter and health resort. In the Albert S. White Park there is a notable collection of cacti; and Huntington Park is high and rocky, is well planted with trees and has a finely shaded automobile drive. Magnolia Avenue, bordered with pepper-trees, is 10 m. long and 130 ft. wide; and Victoria Avenue is similarly parked and lined with semi-tropical trees. Riverside is the seat of an important (non-reservation) boarding-school for Indians, Sherman Institute (1903), which in 1908 had 909 students. Riverside is devoted to the cultivation of oranges, lemons and other subtropical fruits, and has a large trade in these products. It is in the centre of the finest orange district of the state; near Huntington Park is the state citrus experiment station (1906), with an experimental orchard of 20 acres. The cultivation of naval oranges was first introduced from Brazil into the United States at Riverside in 1873; the two original trees planted by the Atchison and company are still standing in 1909. The domestic water supply is obtained from artesian wells. In 1870 the site of the present city, then called Jurupa Rancho, the name of the old Spanish grant, was purchased by the Southern California Colony Association. The settlement was chartered in 1883 as a city, with limits including about 50 sq. m. Riverside county was not organized until ten years later. From 1895 there were no saloons in the city.

RIVES, WILLIAM CABELL (1793–1868), American political leader and diplomat, was born in Nelson county, Virginia, on the 4th of May 1793. He attended Hampden-Sidney and William and Mary colleges, was admitted to the bar, and practised in Nelson county (till 1821) and afterwards in Albemarle county. In politics a Democrat, he served in the state constitutional convention in 1816, in the Virginia House of Delegates in 1817–19 and in 1822, and in the Federal House of Representatives in 1823–29. From 1829 to 1832 he was minister to France; in 1833 he entered the United States Senate, but in the following year resigned. From 1836 to 1845 he again served in the Senate, and in 1849 was president of the Senate. He was appointed minister to Russia in 1852. In February 1861 he was sent as a special envoy to the Peace Conference in Washington on an occasion of some difficulty between the states, and was appointed minister to France in 1861. He was a delegate to the Peace Conference in Washington on an occasion of some difficulty between the states, and was appointed minister to France in 1861. He was a delegate to the Peace Conference in Washington.
Quick or the Dead? (1888); she married John A. Chanler in 1888, and after their divorce married in 1896 Prince Pierre Troubtszky of Russia.

**RIVET** (O. Fr. rivet, from river, to fix, fasten together, of unknown origin; Skeat compares Icel. rjó, to stitch together), a metal pin or bolt used to fasten metal plates together. A rivet, made of wrought iron, copper or other malleable substance, is usually made with a head at one end, the other end being hammered out after passing through the plates so as to keep them closely fastened together. A “bolt” differs from a rivet in that one or both ends have screw-threads to hold a nut (see Shipbuilding).

**RIVIERA**, the narrow belt of coast which lies between the mountains and the sea all round the Gulf of Genoa in the north of Italy, extending from Nice on the W. to Spezia on the E. It is usually spoken of as Riviera di Ponente (“the coast of the setting sun”), the portion between Nice and the city of Genoa; and as Riviera di Levante (“the coast of the rising sun”), the portion from Genoa to Spezia. All this district, being open to the S. and sheltered from the N. and E. winds, enjoys a remarkably mild climate (winter mean, about 49°F.); so much so that the vegetation in many places partakes of a subtropical character (e.g. the pomegranate, agave, prickly pear, date, palm and banana). Large numbers of flowers, especially roses, violets, hyacinths, &c., are grown near Nice, Mentone, Bordighera and other towns, and sent to the London and Paris markets. Bordighera is particularly noted for its noble groves of date-palms, one of the few places in Europe where these trees grow. The uncommon mildness of the climate, conjoined with the natural beauty of the coast scenery,—the steep sea-cliffs, the ruined towers and the range of the Maritime Alps,—attracts thousands of invalids and convalescents to spend the winter in the town of chains and villages which stretch from the one end of the Riviera to the other, while these resorts are frequented for sea-bathing in summer by the Italians. Proceeding from W. to E. the following are the places to which visitors principally resort: Nice, Monaco (an independent principality), Monte Carlo, Mentone (the last town on the French Riviera), Ventimiglia, Bordighera, Ospedaletti, San Remo, Porto Maurizio, Oneglia, Diano Marina, and in the vicinity of last-named place Santa Margherita, Rapallo, Chiavari, Sestri Levante, Levanto, Spezia, and San Terenzo (Lerici) in the Riviera di Levante. The Riviera labours, however, under the grave drawback of being liable to earthquakes. In the 19th century there were four such visitations, in 1818, 1831, 1854 and 1887, which especially affected the western Riviera. A railway runs close along the shore all through the Riviera, the distance from Nice to Genoa being 116 m., and the distance from Genoa to Spezia 50 m. In the latter stretch the line burrows through the many projecting headlands by means of more than eighty tunnels. The pearl of the eastern Riviera is the stretch (6 to 7 m.) between Rapallo and Chiavari. Lord Byron and Shelley both lived and wrote on the shores of the Gulf of Spezia, and Dickens wrote The Chimes at Genoa.

**RIVIERE, BRITON** (1840-1905), English artist, was born in London on the 14th of August 1840. His father, William Riviere, was for some years drawing-master at Cheltenham College, and afterwards an art-teacher at Oxford. He was educated at Cheltenham College and at Oxford, where he took his degree in 1867. For his art training he was indebted almost entirely to his father, and early in life made for himself a place of importance among the artists of his time. His first pictures appeared at the British Institution, and in 1857 he exhibited three works at the Royal Academy, but it was not until 1863 that he became a regular contributor to the Academy exhibitions. In that year he was represented by “The Eve of the Spanish Armada,” and in 1864 by a “Romeo and Juliet.” Subjects of this kind did not, however, attract him long, for in 1865 he began, with a picture of a “Sleeping Deerhound,” that series of paintings of animal-subjects which has since occupied him almost exclusively. Among the most memorable of his productions are: “The Poacher’s Nurse” (1866), “Circé” (1871), “Daniel” (1872), “The Last of the Garrison” (1875), “Lazarus” (1877), “Persepolis” (1878), “In Manus Tuas, Domine” (1879), “The Magician’s Doorway” (1832), “Vae Victis” (1885), “Rizaph” (1886), “An Old-World Wanderer” (1887), “Of a Fool and his Folly there is no End” (1889), “A Mighty Hunter before the Lord” (1891), “The King’s Libation” (1893), “Beyond Man’s Footsteps” (1894), now in the National Gallery of British Art; “Phoebus Apollo” (1895); “Aggravation” (1896), “St George” (1899), and “To the Hills” (1901). He has also painted portraits; and at the outset of his career made some mark as an illustrator, beginning with Punch. He was elected an Associate of the Royal Academy in 1878, and R.A. in 1881, and received the degree of D.C.L. at Oxford in 1891.

**RIVINGTON, CHARLES** (1688-1742), British publisher, was born at Chesterfield, Derbyshire, in 1688. Coming to London as apprentice to a bookseller, he took over in 1711 the publishing business of Richard Biswell (1639-1711), and, at the sign of the Duke of York and the Crown in Paternoster Row, he carried on a business almost entirely connected with theological and educational literature. He also published one of Whitefield’s earliest works, and brought out an edition of the Imitation of Christ. In 1736 Rivington founded the company of booksellers who called themselves the “New Conger,” in rivalry with the older association, the “Conger,” dating from about 1700. In 1741 he published the first volume of Richardson’s Pamela. Charles Rivington died on the 22d of February 1742, and was succeeded by his two sons, John (1720-1792) and James (1724-1802). James emigrated to America, and pursued his trade in New York (see NEWSPAPERS, U.S.A.); John carried on the business in the lines marked out by his father, and was the great Church of England publisher of the day. In 1760 he was appointed publisher to the Society for Promoting Christian Knowledge, and the firm retained the agency for over seventy years. Having admitted his sons Francis (1745-1829) and Charles (1754-1831) into partnership he formed the firm of New Conger, which issued a standard edition of the works of Shakespeare, Milton, Locke and other British classics; also Cruden’s Concordance. John Rivington died on the 16th of January 1792. In 1810 John (1779-1841), the eldest son of Francis, was admitted a partner. In 1827 George (1801-1858) and Francis (1805-1883), sons of Charles Rivington, joined the firm. Rivington contracted further ties with the High Church party by the publication (1833, &c.) of Tracts for the Times. John Rivington died on the 21st of November 1841, his son, John Rivington (1812-1886) having been admitted a partner in 1836. George Rivington died in 1858; and in 1850 Francis Rivington retired, leaving the conduct of affairs in the hands of John Rivington and his own sons, Francis H sand (b. 1834) and Septimus (b. 1840). In 1890 the business was sold to Messrs Longmans (q.v.). A business of the same character was, however, carried on from 1889 to 1893 by Mr Septimus Rivington and Mr John Guthrie Percival, as Percival & Co. This was changed in 1893 to Rivington, Percival & Co.; and in 1897 the firm revived its earlier title of Rivington & Co., maintaining its reputation for educational works and its connexion with the Moderate and High Church party.

See The House of Rivington, by Septimus Rivington (1894); also the Publishers’ Circular (15th January 1885, 2nd June 1890).

**RIVOLI VERONESE**, a village of Venetia, Italy, in the province of Verona, on a hill on the right bank of the Adige, 13 m. N.W. of Verona, 617 ft. above sea-level. Pop. (1901) 1340. It is celebrated as the scene of the battle in which, on the 15th of January 1797, Napoleon inflicted a decisive defeat upon the Austrians commanded by Josef Alvintzi, Baron von Barbèk (1735-1810) (see FRENCH REVOLUTION WARS). A famous street in Paris (Rue de Rivoli) commemorates...
the victory, and under the empire Marshal Masséna received
the title of duke of Rivoli. The strong positions around Rivoli,
which command the approaches from Tirol and the upper
Adige into the Italian plain, have always been considered in
military history as a formidable obstacle, and Charles V. and
Prince Eugene of Savoy preferred to turn them by difficult
mountain paths instead of attacking them directly. Minor
engagements, such as rearguard actions and holding attacks,
have consequently often taken place about them, notably
in the campaign of 1796-97. An engagement of this character
was fought here in 1848 between the Austrian and the Pied-
montese troops.

RIXDORF, a town of Germany, lying immediately south of
Berlin, of which it practically forms a suburb, though
retaining its own civic administration. Pop. (1880) 18,729;
(1890) 59,045; (1905) 153,650. It is connected with the
metropolis by a railway (Ring-bahn) and by an electric tramway.
It contains no public buildings of any interest, and is almost
entirely occupied by a large industrial and artisan population,
engaged in the manufacture of linoleum, furniture, cloth, cloths,
planois, beer, soap, &c.

Rixdorf is chiefly interesting as a foundation of Moravian Brethren from Bohemia, who settled here in 1737 under
the protection of King Frederick William I. German Rixdorf,
which is now united with Bohemian Rixdorf, was a much more
ancient place, and appears as Richardo in 1630 and as
Riegenstorp in 1435. Before 1435 it belonged to the order of
the Knights of St John.

RIZZIO, or RICCI, DAVID (c. 1533-1566), secretary of
Mary (q.e.), queen of Scots, was a native of Turin, and came
to Scotland in 1561 in the train of the Piedmontese ambassador.
The queen wanted a bass singer, and he entered her service as
a musician, becoming also her valet de chambre, and in
1564 private foreign secretary. After her marriage to Darnley
in 1565 his influence with Mary became paramount, and he
gave himself great airs and affected considerable state,
practically superseding Maitland of Lethington as secretary of
state. His elevation aroused the active hostility of Darnley
and the other nobles, and he was suspected of being the queen's
lover. On the evening of the 9th of March 1566, the ears
of Morton and Lindsay, with armed followers, entered
Mary's supper chamber at Holyrood, seized Rizzio, hacked
him to death with daggers, and threw his body into the
courtyard.

See Ruthven's Narrative of Rizzio's Murder (1836); and the articles
on MARY, QUEEN OF SCOTS, and allied biographies.

ROACH (Leuciscus rutilus), a small fish belonging to the
Cyprinid family, the genus Leuciscus having many representa-
tives in Europe, in which the rudd, the chub and the dace
are included. It may attain a length of over 12 in., but a
roach of 2 lb is an unusually large one. It is good sport for
anglers, but is not esteemed for the table. The general colour is
silvery, with reddish fins. It does not occur in Ireland.
In America, the "golden shiner" minnow (Abramis chrysocleucus)
is sometimes called a roach.

See Greville Fennell's Book of the Roach, 1870.

ROADS AND STREETS.

These words embrace the two
divisions into which the lines of communication made by man
for vehicular and pedestrian traffic between different places
may be roughly classified. In current usage "road" is applied as a
general term for all broad made ways from place to place,
whether with separate side-paths for foot-passengers or not,
while "street" is confined to the roads through towns, villages
and other inhabited places, more or less lined by houses and other
buildings on either side. The present article is confined to the
methods adopted in making roads, from the first great road-
makers, the Romans, down to modern times. The roadways of
times anterior to the Romans, at least in Europe, were merely
the tracks worn by the feet of pedestrians and animals, and
the wheels of vehicular traffic.

Etymologically considered, "road" in its current usage is late
in its appearance. The first quotation in the English
Dictionary is from Shakespeare (1 Henry IV. 2, i. 16). The true
O.E. word was weg, way, common to Teut. languages, and
probably allied to Lat. via. The O.E. rād meant the act of
riding, and is derived from rīð- to ride, and is thus used of a
journey on horseback, and in compounds of a track or course,
"swærwād, the swan's track, a poetic word for the sea- or ste
tρrād, course of a stream, huvārād, wheel-track, &c. A special use
of the word, occurring as early as the Anglo-Saxon Chron.
c. 900, was for a hostile foray, an "inroad," a "raid," which is the
N. Eng. doublet of "road," and has superseded it in general use.
Another use, which still survives, and shows the origin, is that
of a space of water where ships may "ride at anchor in security
from stress of weather, a roadstead." "Street" (O.E. strēt)
represents the Lat. strāla via, paved way (from sternere, to strew,
pave). It is one of the few words adopted in O.E. from the Romans.

The earliest roads about which anything definite is known,
so far as construction is concerned, are those of ancient Rome,
one of the oldest of which and the most celebrated
for the grandeur of its works—the Appian Way—was
 commenced in 312 B.C. Roman roads are remarkable
for preserving a straight course from point to point regardless
of obstacles which might have been easily avoided. They appear
to have been often laid out in a line with some prominent land-
mark, and their general straightness is perhaps due to con-
venience in setting them out. In solidify of construction they
have never been excelled, and many of them still remain, often
forming the foundation of a more modern road, and in some
instances constituting the road surface now used. It is con-
sequently possible, with the help of allusions of ancient writers,
to follow the ideal mode of construction, though this was not
always adopted. Two parallel trenches were first cut to mark
the breadth of the road; loose earth was removed until a solid
foundation was reached; and it was replaced by proper material
consolidated by ramming, or other means were taken to form a
solid foundation for the body of the road. This appears often
to have been composed of four layers, generally of local materials,
though sometimes they were brought from considerable distances.
The lowest layer consisted of two or three courses of flat stones,
or, if these were not obtainable, of other stones, generally
laid in mortar; the second layer was composed of rubble masonry
of smaller stones, or a coarse concrete; the third of a finer
concrete, on which was laid a pavement of polygonal blocks of
hard stone jointed with the greatest nicety. The four layers are
found to be often 3 ft. or more in thickness, but the lower ones
were dispensed with on rock, on which the paving stones were
sometimes laid almost directly. The paved part of a great road
appears to have been about 14 ft. wide, and on either side, and
separated from it by raised stone edgings, were unpaved side-
ways, each of half the width of the paved road. Where, as on
many roads, the surface was not paved, it was made of hard
concrete, or pebbles or flints set in mortar. Sometimes clay and
marl were used instead of mortar, and it would seem that where
inferior materials were used the road was made higher above the
ground and rounded in cross section. Streets were paved with
large polygonal blocks laid as above described, and footways
with rectangular slabs. Specimens are still to be seen in Rome
and Pompeii, while in Britain many of the roads were of hard
gravel or had a cobbled surface. There are no traces of Roman
influence in the later roads in England, but in France the Roman
method appears to have been followed to some extent when new
roads were constructed about the beginning of the 18th century.
A foundation of stones on the flat was laid, and over that two layers
of considerable thickness, of larger and smaller stones, bordered
by large stones on edge, which appeared on the surface of the
road. In 1764 Tréssaguet set the foundation-stones on edge and
reduced the thickness of the upper layers, and his method was
generally followed until the influence of John Loudon McAdam
(1756-1836) began to be felt. A French chaussée with acco-
ments still retains some resemblance to the old Roman
roads.

388

RIXDORF—ROADS AND STREETS.
The almost incredibly bad state of the roads in England towards the latter part of the 17th century appears from the accounts cited by Macaulay (Hist. c.iii.). It was due chiefly to the state of the law, which compelled each parish to maintain its own roads by statute labour, but the establishment of turnpike trusts and the maintenance of roads by tolls do not appear to have effected any great improvement. At the time of Arthur Young's six months' tour in 1770 the roads would seem to have been almost as bad as ever, and it is doubtful if there was much improvement up to the beginning of the 19th century. The turnpike roads were generally managed by ignorant and incompetent men until Telford and McAdam brought scientific principles and regular system to their construction and repair. The name of Telford is associated with a pitched foundation, which he did not always use, but which closely resembled that which had been long in use in France, and the name of McAdam often characterizes roads on which all his precepts are disregarded. Both insisted on thorough drainage and on the use of carefully prepared materials, and adopted a uniform cross section of moderate curvature instead of the exaggerated roundness given before; but, while Telford paid particular attention to a foundation for the broken stone, McAdam disregarded it, contending that the subsoil, however bad, would carry any weight if made dry by drainage and kept dry by an imperious covering. McAdam was engaged more with the repair of old roads than with the construction of new ones, and, though it is not possible to agree with all his doctrines, the improvement which he effected in road management and maintenance was great and lasting.

**Construction of Roads.**—A road should be as short as possible between two points to be connected, but straightness must often be sacrificed to avoid difficulties and expense and to secure good gradients. The latter should be as easy as practicable, having regard to the country to be traversed, and it is desirable that there should be a ruling gradient than which none should be steeper. On the level macadamized road in ordinary repair the force which the horse has to put forth to draw a load may be taken as one-thirtieth of the load. But in going uphill the horse has also to lift the load, and the additional force to be put forth on this account is very nearly equal to the load drawn, divided by the rate of gradient. Thus on a gradient of 1 in 30 the force spent in lifting is one-thirtieth of the load, and in ascending a horse has to exert twice the force required to draw the load on a level. In descending, on the other hand, on such a gradient, the vehicle, when once started, would just move of itself without pressing on the horse. A horse cannot without difficulty exert twice his usual force for a time, and can therefore ascend gradients of 1 in 30 on a macadamized surface without sensible diminution of speed, and can trot freely down them. These considerations have led to 1 in 30 being generally considered as the ruling gradient to be aimed at on first-class roads, though 1 in 40 has been advocated. Telford adopted 1 in 30 as the ruling gradient in the thoroughfares of the North of Scotland, and there are only very few gradients steeper, in places where they were unavoidable. All unnecessary rises and falls should be avoided, but a dead level is unfavourable for drainage, and on this account 1 in 100 to 1 in 150 is the flattest gradient that is desirable. Such slight rises and falls are probably rather favourable than otherwise to ease of draught by horses.

In transverse section, roads in the United Kingdom generally consist of a carriage-way, with spaces on each side, on one or both of which there may be a footpath, and fences and ditches. The width of the carriage-way may be from 15 ft., which allows of the easy passage of two vehicles, to 30 or 50 ft. for roads of importance near towns. The side spaces may be from 4 or 5 to 8 or 10 ft. wide; wide sides give the sun and air access to the road, and tend to keep it dry, and also afford space for the deposit of road materials and scrapings. In cuttings or on embankments the transverse section has of course to be modified. The road surface should have just enough convexity to throw the wet off freely, and a very moder-
consolidate properly without admixture; indeed they became more intractable the more they were abraded by rolling. G. F. Deacon of Liverpool patented a binding composed of large chips of trap rock or else of siliceous gravel from the size of three-quarters of an inch down to that of a pin’s head, together with about one-fourth part of macadam sweepings obtained in wet weather. This will enable the roller to consolidate the road-metal in a third of the time required for broken stone alone. The harder materials here suggested differ essentially from the sand and dirt formerly used for binding, since they fill up all the vacant spaces and cannot be washed down.

A new road is preferably finished by rolling, since in that way the materials are consolidated with less waste, and wear and tear of vehicles is saved. A 15-ton steam-roller, 7 ft. wide, giving upwards of 2 tons weight per foot can thoroughly consolidate 1000 to 2000 sq. yds. of newly laid materials per day.

A pitched foundation, as used by Telford, consists of flat stones set on edge in courses across the road with the broader edges downwards. All inequalities must be knocked off, and small stones and chips must be firmly planted into the interstices with a hammer, so as to form a regular and level surface of the same thickness. A foundation of cement concrete 6 in. thick was used by Sir J. MacNeill on the Highgate Archway (London) road on a bad clay bottom, and common lime concrete was subsequently used elsewhere. A bed of lime concrete 12 in. thick was laid as a foundation in Southwark Street and on the Thames Embankment, but it is too expensive for a macadamized road under ordinary circumstances. Foundations of large and rough hard-core should be rolled down to a surface close enough to keep the finer pieces of road-metal from dropping down, so as to create hollows which, though they may escape the roller, will be detected by the laden wheel and by the pounding of the heavy hoof. But there is no foundation equal to sand, which has the property of spreading pressure over an enlarged area. A 12-in. bed of sand rolled down to 8 in. has been recommended, but military engineers have found that a layer of so little as 3 or 4 in. is sufficient as a foundation for macadam in very bad ground that has been rolled, or on an embankment that has had time to settle.

Thatched Roads. Broken stone mixed with some bituminous composition has been found very suitable for suburban roads, and for towns where the nature of the traffic requires smooth roadways reasonably free from noise and dust. In its simplest form, tar macadam is made from a good hard limestone broken into the usual sizes, the fine chips being used for top-dressing. In a shed a large hearth is formed of stone flagging, under which the flues of a furnace are constructed, and upon the hearth the broken stone is spread in a layer just as thick as the heat may be able to penetrate, to dry off the moisture and make the stones distinctly hot. The load of an ordinary barrow is tipped on an iron plate and gas tar is poured over it (from 8 to 12 gals. per cubic yard), while a couple of men with shovels turn it over exactly as they would turn concrete. No more tar should be used than is required completely to blacken the whole surface of every stone; and when this has been done, the stone can be thrown upon the heap, where it may be kept for one or two months, under cover, to allow the volatile oils to evaporate. Fine siftings are treated in the same way. When it has been properly seasoned, the mass should assume a greenish lustre; and when cut into by a shovel, the particles will cling together and crawl down slowly so that the heap is said to be “alive.” In that state it may be used. The tar ought to be boiled, and if too thin, a little pitch may be added to it, though not enough to make the heap consolidate. A mixture of tar with pitch and creosote oil is used by more precise makers, one formula being 12 gals. tar, ½ cwt. pitch and 2 gals. creosote oil to a ton of stone. But these ingredients differ considerably in their chemical composition, and the proportions have to be varied according to experience. Moreover, as regards the tar and pitch used in the manufacture of pavements, the varieties that come directly from a vegetable source are liable to melt in hot and to become brittle in cold weather; coal tar is only moderately proof against these extremes.

Tar macadam must be put down in dry weather. If the material seems too dry, hot tar may be applied as before, but only as an expedient, and with great economy, so that the pavement may not soften in the sun. Upon a well-rolled foundation of hard material a layer of the coarser macadam should be put and rolled, then a layer of the smaller grade. For a road of light traffic a coat of the fine siftings may be put down and heavily rolled to a finished surface. For a road of heavier traffic the second coat should be dressed before rolling with tarred stone of a gauge of three-quarters of an inch to an inch and a quarter, and rolled first with a roller of not more than 10 or 12 cwt., then with one of 30 cwt. After the traffic has been turned on the road for a few days it should again be rolled as heavily as may be necessary to restore any parts that have been disturbed. But such roads are often consolidated by steam-rollers of 10 or 15 tons. For refacing an old road the prongs attached to a steam-roller will easily lift the old layer. Small depressions may be well tarred and levelled up with tar, and a good face may be dressed every three years with tar and a fresh coat of broken stone. But if the surface of the road is irregular, water will hang upon it, and frost may cause it to become slippery. The lack of affinity between granite and bitumen prevents the use of tar macadam upon roads of heavy traffic.

Concrete Macadam. Rocks like granite and syenite may be used in combination with Portland cement. The ingredients are mixed in about the proportion of four parts of broken stone that has first been well wetted, one and a quarter or two parts of clean sharp sand, and one of cement put on in two layers, the second being rolled by hand to the required shape and to a good surface. It should remain for two or three weeks to dry and set. Want of elasticity may be urged against concrete macadam, and it is productive of dust, but in some cases it has proved satisfactory.

Gravel Roads. Smooth rounded gravel is unsuitable for roads unless a large proportion of it is broken, and about an eighth part of ferruginous clay added for binding. Rough broken gravel may be applied in two or more layers, but each must be of similar composition, or the smaller stuff will work downwards. A gravel road should be always under inspection, and repairs should be done without delay. A track for equestrian exercise should be made of hoggin or fine gravel, that will remain soft when raked or harrowed and watered. It should be well drained. A foundation of rough hard core will let the hoggin pass down into it, so that the hard core will appear at the surface. The best material is rough chaff sufficiently rolled to stop the gravel while draining off the surface water.

Stone Pavements. Early pitched roadways consisted of pebbles or rounded boulders (“cobblesstones") bedded in the natural surface or in sand or gravel. The next step in advance was to employ roughly squared blocks; but the wide and irregular joints admitted the water to the subsoil, and the mud worked up and the stones sank irregularly under the traffic. Telford, who was called upon to report on the street pavements of the parish of Hanover Square in 1824, saw the necessity of cutting off all connexion between the subsoil and the paving stones. He recommended a bed of about 6 in. of clean river ballast, rendered compact by being travelled upon for some time before the paving was laid, but he subsequently considered that nothing short of 12 in. of broken stone, put on in layers 4 in. thick and completely consolidated by carriages passing over them, would answer the purpose. He recommended paving stones of considerable depth and of from 4½ to 6 or 7½ in. breadth for the greatest thoroughfares, and he pointed out the importance of working the stones flat on the face and square on all sides, so as to joint close and preserve the bed or base as nearly as possible of the same size as the face, and of carefully placing together in the same course stones of equal
broadth. Many pavements thus laid with stones of considerable breadth still remain, but experience proved that it was a mistake to suppose that broad stones having a larger base would support better the weight and shocks of heavy traffic; on the contrary, a wide stone has a tendency to rock on its bed, and also to wear round on the top and become slippery. To obtain an evener surface and a better foothold for the horses the stones were reduced in width, and in 1840 a granite pavement was laid by Walker on Blackfriars Bridge, which may be considered the first of modern set pavements. The stones were 3 in. broad and 9 in. deep; they were laid on a bed of concrete 1 ft. thick and were jointed with mortar. The reduction of breadth to about 3 in. was generally followed, but it was some time before a concrete foundation was employed to any great extent, the frequent breaking up to which streets are subject having prevented it. In London a foundation of broken stone has been continued in some thoroughfares, the sets being evenly bedded in gravel upon it and rammed with a heavy wooden rammer. Hard core—a mixture of broken stone, cinder, brick rubbish and old building materials—has also been largely used to form a foundation. In the northern towns, however, the pavements are laid 6 in. deep, with a surface of 3 in., and traffic is exceptionally heavy a pitched foundation of stones on edge has been laid when the sets were not paved upon an old macadamized surface. The concrete for a foundation to a paved street should be made with the best Portland cement, thoroughly mixed in proper proportions with the sand and gravel or other materials used, water being added as sparingly as possible. A thickness of 6 in. of well-made cement concrete is sufficient for the heaviest traffic, and it can be cut out in slabs for pipe-laying or repairs and can be relaid and cemented in its place. To obtain the best result a new foundation should not be paved upon for a week. A foundation of bituminous concrete is sometimes used where only a thin bed can be laid, in consequence of there being an old foundation which it is undesirable to disturb. It is made by pouring a composition of coal-tar, pitch and creasote oil while hot over broken stone levelled and rolled to the proper form, and then spreading a thin layer of smaller broken stone over the surface and rolling it in. It has the advantage that it can be paved upon a few hours after it has been laid.

The best materials for pavement sets are the hard igneous and metamorphic rocks, though millstone grit and other hard sedimentary rocks of the same nature are used when the traffic is comparatively light. Excessively hard stone which bears smooth and slippery is objectionable in spite of its durability.

Joints simply filled in with gravel are of course pervious to water, and a grout of lime or cement does not make a permanently watertight joint, as it becomes disintegrated under the vibration of the traffic. Grouted joints, however, make a good pavement when there is a foundation of concrete or broken stone or hard core. Where there is not a regular foundation imperviousness in the joints is of great importance. In some of the Lancashire towns the joints have for many years past been made by first filling them with clean gravel, well shaken in by ramming, and then pouring in a composition of coal-tar pitch and creasote oil, which is allowed to penetrate and fill up the interstices, the pavement being finished by covering it with small gravel. Joints so formed are impervious to wet and have a certain amount of elasticity; the foundation is kept dry; and the pavement with bituminous grout of this kind keeps its form well for many years. The objection is made that in hot weather the composition runs from the joints and makes the streets unpleasant for foot-passengers.

A pavement consisting of broad, smooth, well-jointed blocks of granite for the wheel tracks, and pitching between for the horse track, was laid by Walker in Commercial Road (London) for the heavy traffic to the West India Docks in 1825, and similar pavements have been successfully used elsewhere, principally for heavy traffic, in streets only wide enough for one vehicle. In Milan, Turin and other towns of northern Italy tramways of the same sort are extensively used for the ordinary street traffic. The tractive force required is small, while the foothold on the horse track is good; but the tramstones are slippery for horses to pass over. The rigidity of the roadway renders it more suitable for slow heavy traffic than for light quick vehicles, and the improvement in other pavements has limited the application of this one in ordinary streets.

Brick Paving.—Since about 1885 brick as a paving for carriage-ways has been adopted to a considerable extent, chiefly in the form of shale bricks, in American cities. The clay is a hydrated silicate of alumina, containing about 24% of alumina with 15% of iron, lime, soda, potash and magnesia. Lime is injurious, but alkalis to the extent of 3% are needed to ensure a slight degree of vitrification. Various tests are used to determine their liability to absorb moisture and to be abraded. That for abrasion is made by rolling half-bricks in an iron barrel or rattler in company with pieces of cast-iron for a given time, and noting the effect on the surfaces, but particularly on the angles, which should be tough enough to resist chipping. Comparisons are also made with test pieces of granite that are mixed with the bricks. To guard against the harder set of the brick, the surface is broken, and the upper angles rounded to a radius of three-eighths of an inch. Upon a foundation of concrete or well-rolled ballast a cushion of bed or coarse sand from half an inch to 3 in. thick is laid, and on this the bricks are set. They are then rolled till level, or are heavily rammed, a blanket being interposed between the bricks and the rammer. No channels-courses are used. Pitch is poured in at the joints, but by no means on the surface, as that would make them slippery. Brick roadways have stood well under hard wear for fourteen years. Although in the United Kingdom bricks are produced unequalled for hardness and finish, no serious attempt has been made to introduce a tough brick for roadways that will neither chip nor wear smoothly. In various experiments with bricks that seemed most suitable they stood hard traffic for about a year. Clay of absolutely uniform character, and kilns that will ensure perfect equality in firing, are requisite. Slag bricks, made to interlock in the form of a double hexagon, the surface being grooved to a small pattern, have stood good tests for wear and foothold on a perfectly level surface. Many attempts have been made to use compositions, into which asphalt or cement usually enters, for making blocks or slabs, square or hexagonal, that can be laid down on a concrete foundation. A mosaic of macadam set in an iron frame is fixed by running molten slag into the back of the block. Small square pieces of oak are formed into blocks, end-grain upwards. Staffordshire blue bricks, made with holes to hold wooden plugs, have been used with some success. Broad blocks not firmly fixed down usually become loose and tilt when subjected to traffic.

Asphalt Paving.—Asphalt was first used for street paving in Paris in 1854. It was introduced in London in 1869, when Threadneedle Street was paved by the Val de Travers Asphalt Company, and since then it has been extensively used for paving both streets and footways. The material is a hard stone impregnated with bitumen in the proportion of from 6 to 8% in the Seysel rock, and from 10 to 12% in that from Val de Travers. Asphalts containing less than the former proportion have not sufficient coherence for street pavements, and those containing more than the latter proportion soften from heat in the summer. Asphalt is employed either as a mastic or compressed. The mastic is previously prepared in cakes and is melted for use in caldrons with a small quantity of bitumen, and for a street pavement is thoroughly mixed with sand or grit. It is spread in one thickness on a concrete foundation, covered with sand, and beaten to an even surface. This material has not proved so successful for street surfaces as compressed asphalt. To produce this, the rock asphalt, previously reduced to a fine powder by mechanical means, is heated in revolving ovens to from about 220° to 250° F., spread while still hot, and compressed into a solid mass by hot
disk-shaped rammers, and afterwards smoothed with irons heated to a dull redness. The original rock is thus, as it were, recompressed by taking advantage of the power of cohesion of the molecules under pressure when hot. In heating the powder the moisture combined in the limestone must be driven off without reducing the proportion of the bitumen more than is unavoidable. The powder cools very slowly, and may be conveyed long distances from the ovens; it may even be kept till the next day before use. When laid it should still retain a temperature of from 150° to 200°. It is spread evenly with a rake by skilled workmen for the whole width of the street to a thickness about two-fifths greater than the finished coating is intended to be. Ramming is commenced with light blows to ensure equality of compression throughout, and is continued with increased force until the whole is solidified. The ramming follows up the spreading, so that a joint is required only when the work is interrupted at the end of a day, or from some other cause. In a few hours after it has been laid an asphalt pavement may be used for traffic. When finished, its thickness may be from 3½ to 4 in., according to the traffic; a greater thickness than the latter cannot be economically compressed with certainty. The asphalt loses thickness by compression under the traffic for a long time and to the extent, it is said, of one-fifth or one-fourth, but the wear appears to be very small. The wear-resisting power of the asphalt is due to its elasticity; tracks are made by the wheels at first, but when thoroughly compressed by the traffic the surface retains little or no trace of the heaviest loads. Repairs are easily and quickly made by cutting out defective places and ramming in fresh heated powder, which can be done in the early morning without stopping the traffic. An unyielding foundation is indispensable; it should be of the best Portland cement concrete, 6 in. in thickness, which must be well set and perfectly dry throughout before the asphalt is laid, or the steam generated on the application of the hot powder will prevent cohesion and lead to cracks and holes in the asphalt, which quickly enlarge under the traffic. For the same reason the asphalt should be laid in dry weather. The concrete foundation must be carefully fitted to the proper profile, with an inclination toward the sides of not more than 1 in 50, which is sufficient with so smooth a surface. About 1 in 50 is the steepest gradient at which an asphalt pavement can be safely laid. When either dry or wet it affords good foothold for horses, but when beginning to get wet, or drying, it is often extremely slippery. This is said to be due to dirt on the surface, and not to the nature of the material. Sand is strewn over the surface to remedy the slipperiness; it tends, however, to wear out the asphalt, and great cleanliness is the best preventive. An asphalt pavement can be kept cleaner than any other, is impervious to moisture, and dries quickly. While the road is kept clean, a very slight depression is made by the horse-shoe, which for foothold is a great advantage. The noise made on asphalt by horse-traffic is about the same as that made on hard wood, and is not much more than is necessary for the safety of foot-passengers. In American cities asphalt has been adopted in a total area of more than a square mile, and much pavement of a very large proportion, perhaps five parts in six, of a hard non-bituminous material. In America it is found cheaper to get the purer bitumen of the island of Trinidad, and to procure in the localities the bulky material required for admixture—a coarse angular sand with a little pure carbonate of lime. An asphaltic cement is made from refined asphaltum. Of this, from 12 to 15% is used with 70 to 80% of sand and 5 to 15% of limestone dust. These materials are heated and stirred together into a stiff mastic paste to form the wearing surface of the road. Upon the concrete foundation is first spread a layer of fine bituminous concrete called "binder," ½ in. thick, to unite the wearing surface to the concrete foundation. Upon the binder the asphalt is laid to a thickness of 2 in., beingspread with iron rakes and brought to its finished surface by the steam roller. Obviously this is a process requiring great judgment and experience; but the system has been established in America, to the exclusion of European methods. Its great recommendation is the freedom from slipperiness that is said to result from the admixture of sharp sand, and this freedom is really the one quality in which asphalt pavement is seriously deficient. This system has been introduced into England.

Wood-Paving.—Wood pavements were introduced in England in 1839. Hexagonal blocks of fir, 6 to 8 in. across and 4 to 6 deep, were bedded in gravel laid on a foundation previously levelled and beaten. The blocks were either heaved off at the edges or grooved across the face to afford foothold. Other wood pavements were tried in London about the same time, but they soon got out of order from unequal settlement of the blocks, and most of them lasted but a few years. The "improved wood pavement" was first used in London in 1871. After the foundation was formed to the proper cross-section a bed of sand 4 in. deep was laid, upon which came two layers of inch deal boards saturated with boiling tar, one layer across the other. The wooden blocks were 3 in. wide, 5 deep, and 9 long; they were dipped in tar and laid on the boards with the ends close together, but transversely the courses were spaced by fillts of wood three-fourths of an inch wide nailed to the floor and to the blocks. The joints were filled up with clean pebbles rammed in, and were run with a composition of pitch and tar, the surface being dressed with boiling tar and strewn with small sharp gravel and sand. In this pavement a somewhat elastic foundation was provided in the boards, which were also intended to prevent unequal settlement of the blocks; but the solidity of the pavement depended upon its water-tightness, for, when the surface water reached the sand, as it did sooner or later, settlement and dislocation of the blocks under the traffic arose. Pavements on this system were laid between 1872 and 1876, and were kept in repair and relaid from time to time, but about 1877 the plank foundation was abandoned for a foundation of cement concrete, which is now generally employed. Australian hard woods have to a large extent supplanted the fir and pine which were at one time used as the materials for wood-paving. The softer woods, which afford reasonable, but transient foothold and are comparatively noiseless, wear rapidly under heavy traffic, and are very liable to decay. Moreover, the wood actually used has been of mixed qualities, and when a block fails, those near it suffer; thus holes are formed, so that the pavement has to be renewed before its time. English oak and beech, which are perhaps too hard, have been used with varying results; but the Australian woods of the genus Eucalyptus have been most extensively tried, and with the most satisfactory results. Those which are best known are jarrah and kauri, but tallow wood, black-butt, blue-gum, red-gum, and spotted-gum, with others, have been tried. Of these, one or two are too dense and hard to afford foothold, others are not easily procured, but jarrah and kauri are used extensively. When cut from the matured heart-wood they are uniform in quality, hard enough for durability, and rough enough to afford fairly good foothold. A very large quantity of wood has been used in London under the name of American red-gum. In such cases the wood was moistened from the soft and hard woods above and between. Wood blocks for paving must be cut with the utmost precision as to the depth of 5 or 6 in. and the breadth of 3 in. The usual length of 8 or 9 in. should also be kept well enough for bond. A long block is liable to tilt. As to depth, although a slight depression may be of little account, the least projection in a block will be immediately noted as a jolt by the swift-moving wheel. The laying and jointing of wood blocks on concrete is still a matter of experiment. They may be set on a half-inch bed of sand, which is supposed to, though it is doubtful whether it actually does, make the pavement elastic to the tread. If the blocks are not accurately gauged, the sand enables the paviour to adjust them to a uniform surface. But the practice most approved is to pave directly upon the smoothly finished concrete, trusting for elasticity to the wood. On the revival of wood-paving it was thought necessary, for foothold, to leave
wide joints filled with small gravel grouted with cement; but this is mischievous. The cement breaks up, and with the blocks shrink, the filling-in is driven down and, when they again get wet, they have less room to expand, the side kerbs are driven back, and the foot-pavements are displaced, so as to require relaying. To guard against this, a space of about 2 in. has been left between the pavement and the kerb, to be temporarily filled with clay or sand, which can be cleared out as the pavement expands. But cement has no affinity for wood, and its use, together with the wide joints that were thought necessary to give foothold, has been abandoned. They permitted the edge of the block to be beaten down below the centre, so as to produce a succession of ridges, having much of the character of a "corduroy" road. Asphalted felt placed in the joints has not succeeded. A method very successfully adopted is to leave the end joints slightly open, and to place strips or laths one-tenth of an inch thick between the courses, so that hot pitch can be poured down to fill the joint and cover the surface. The roadway is then strewn with fine sharp gravel. Hard-wood blocks so laid expand very slightly, so that a space of an inch and a quarter is sufficient between the kerb and the blocks. This is laid in a bed of fine sand, and is filled with pitch, when filled with pitch, is more than enough to allow for expansion. Paving has been laid with close joints, small vessels of hot pitch being provided, into which each pavement dips the blocks more or less completely before laying them; but wood blocks are more commonly laid dry, a little pitch being brushed over the surface. The gradual abandonment of the wide joints once considered necessary for foothold will be noticed. Soft wood seems to wear under very heavy traffic about five times as fast as hard wood.

**Plank Roads.**—In opening up a new country, roads, temporary or permanent, must be made with such materials as may happen to be at hand. The plank road often used in American forests makes an excellent track for all kinds of traffic. Upon that side of the space devoted to the road, which the heavy traffic leading to a town will use, two parallel rows of sills 15 to 20 ft. long, 12 in. wide and 4 deep are laid longitudinally flatwise 4 ft. from centre to centre; the earth being well packed and rammed to the level of their faces. The joints are not opposite; a strip of wood is put either under or by the side of each joint. Cross-boards about 8 ft. 3 in. long and 3 in. thick are laid down loosely, so that groups of four boards together will project on alternate sides of the road 3 or 4 in., forming a shoulder to enable vehicles to get on to the track at any point. The remainder of the road space is formed as an earthen track, 12 ft. wide, for light vehicles. Its slope outwards may be 1 in 16, that of the plank road 1 in 32. If the soil is too bad for the earthen track, short lengths of plank road of double width are made at intervals to form passing places. The cross boards are spiked down on five sills, and are sprung so as to give a fall both ways.

**Log Roads.**—The log road is formed across swamps by laying young trees of similar length close together. This is ridiculed as a "corduroy" road, but it is better than the swamp. Good temporary roads may be made by laying down half logs roughly squared upon the ground, close together or with spaces between of a couple of inches, into which earth is well rammed. They may be 8 or 9 ft. long, alternate logs being made to project 3 ft. on each side for convenience of driving on and off the track.

**Charcoal Roads.**—When fuel is available, good roads can be formed of burned materials. Clay is burned into ballast for foundations, or for a temporary track. In American forests charcoal roads have been largely used. Logs from 6 in. to 2 ft. in diameter are piled along the whole route, the stack being 9 ft. broad at the base, 6 ft. high and 2 ft. broad at the top. Dry materials for lighting are intermixed, and the stack is covered up with sods and earth from the side ditches. When burned, the charcoal is simply raked down so as to form a 15-ft. road of a well-rounded section. These roads are dry and hard, and otherwise satisfactory.

The mode of carrying a road across a bog upon a foundation of faggots or brushwood is well known. In India the native roads have been made equal to heavy traffic by laying branches of the mimosa across the track. And in the grasslands, where the soil, when dry, would otherwise be made deep in dust, this is entirely prevented by laying across the track a coarse reed or grass like the pampas-grass, and covering it with 3 or 4 in. of loam.

**Sand Dressing.**—In carrying traffic over a clay soil a covering of 3 or 4 in. of coarse sand will entirely prevent the formation of the ruts which would otherwise be cut by the wheels; and if the ground has already been deeply cut up, a dressing of sand will so alter the condition of the clay that the ridges will be reduced by the traffic, and the ruts filled in.

**Noiseless Roads.**—A comparatively noiseless pavement may be formed with bricks made of cork granulated and mixed with fibre and asphalt; they are set in pitch, and seem to be suitable for rather steep gradients. For a perfectly noiseless pavement, such as is specially required where a carriage entrance under bedrooms is used by night, no substance is equal to indiarubber. For this purpose it is made in inch sheets about 3 ft. wide and as long as the width of the roadway; it is fixed over concrete and secured by iron clips. This arrangement carries the whole of the passenger traffic to St Pancras Station, London, and also a considerable amount of traffic passing under the Euston Square Station Hotel.

**Dustless Roads.**—The necessity for making roads dustless has been rendered urgent by the advent of the motor-car. The oldest and least efficacious method is to convert the dust into mud by the aid of the watering cart; at the best, however, the improvement is temporary, though attempts have been made to obtain more lasting results by using a solution of some hygroscopic salt such as calcium chloride. Various special preparations of petroleum and other oils have been introduced as palliatives, but the most promising treatment for existing macadam roads consists in distributing tar by hand or machine over the surface, care being taken to make the application in fine weather when the roads are dry. The radical solution of the problem, however, is to be sought in the adoption of improved methods and materials for construction, probably with a bituminous binding or matrix.

This same problem occurs in Britain, which, by its rapidity of movement, rendered many of the old country roads in England (suitable, or at least tolerable, as they were for slow-moving traffic) positively dangerous for the new traffic by reason of their narrowness, sharp corners, &c., has been responsible for the passing by the legislature of a very important measure, the Development and Road Improvement Funds Act 1909. This act, in its second part, deals with the question of road improvement, and establishes a Road Board, making it a body corporate. The Board is given powers to make advances to county councils or other highway authorities for the construction of new roads or the improvement of existing roads, as well as itself to construct and maintain new roads. The expression "improvement of roads" is defined by the act as including the widening of a road, the cutting off corners, levelling, treating a road for mitigating dust nuisance, &c. Power is given to the Board to acquire land for the purposes of road improvements. The expenses of the Board are met out of a road improvement grant each year, the greater part of which it was proposed should be provided by diverting the tax on motor spirit and on motor vehicles levied under the Finance Act of 1909-10.

**Watering.**—On macadamized roads in Great Britain watering is only good for the road itself when the materials are of a very sili- cious nature, equally hard in dry weather. With other materials the effect is to soften the road and increase wear. In and near towns watering is required for the comfort of the inhabitants, but it should not be more than enough to lay the dust without softening the road, and the amount required for this may be greatly reduced by keeping the surface free from mud, and by sweeping off the dust when slightly wetted. Pavements are watered to cleanse them as well as to lay the dust, but it must be remembered that both wood
and asphalt are more slippery when wet, and that therefore watering should be obviated as far as possible by thorough cleansing. Hydrostatic vains, by improvements in the distributing pipes and regulating valves, water a wide track uniformly with an amount of water which can be regulated to supply hydrants as required. Watering by the surface is kept moist, but at the expense of the moisture in the air. Sea water has the same effect in a less degree.

Cleaning.—The principal streets of a town are generally cleansed daily either by hand-sweeping and hand-scraping or by machines. Sir Joseph Whitworth's machine consists of a series of revolving brooms on an endless chain, whereby the mud or dust is swept up in an incline into the cart. A less costly and cumbersome machine consists of a track 6 ft. wide and leaves the dust or mud on one side to be gathered up by hand. A horse-scraping-machine which delivers the mud at the side is also used, the blades of the scrapers being movable and adjustable. In the country some use, more especially in the country, scraping-machines, worked by a man from side to side of the road, and scraping a width of about 4 ft. are more convenient.

In a surface of compacted gravel from the constant breaking up and disturbance to which they are subjected for the purpose of laying and repairing gas and water pipes. Subways, either under the middle of the road or near the kerbs, in which the pipes may be laid and be afterwards made a roadway, have been advocated, and in a few instances have been constructed; but they have not hitherto found general favour.

Footways.—Gravel is the most suitable material for country or suburban footways, and a bed 8 in. thick should be laid and should be well drained and should be laid with a roller. An inclination towards the kerb of about half an inch in a foot may be given, or the surface may be rounded, to throw off the water. Where greater cleanliness is desired, or the presence of the rain water is required for concrete similar to that already described, but of smaller materials, makes a good and economical footway. The coating should be 3 or 3 in. thick, composed of two or three layers each well rolled, the lower layer of material of about 1 in. gauge, and the upper layer of coarse or granite chippings. At intervals of about 2 yds. Concrete slabs, especially when silicated and constituting artificial stone, make an excellent footway. The material is composed of crushed gravel, granite or other suitable material, with water mixed with Portland cement, and when set saturated with silicate of soda. This paves has proved more durable than York stone flagging, but it is more slippery, especially when made with granite. York stone makes a good and pleasant footway, especially where the street is not broad, and in London, where the street is not the best quality. It should not be laid of a less thickness than 2 in.; 2½ or 3 in. are more usual. The flags should be squared and cut to regular dimensions, and be laid bedded and jointed with mortar. Caithness flag is much more durable than York stone and wears more evenly; it is impervious to wet and dries quickly by evaporation. The edges are sawn, and the regularity of the surface prevents the sand from being washed out. It is, however, expensive. York stone, Purbeck or other stone sufficiently strong to stand the blows from wheels to which it is subjected. It should be at least 4 in. wide and 9 in. deep and in lengths of not less than 3 ft. A general recommendation is that a width of 6 ft. is desirable, and that the kerb should be 8 in. wide, and that a 1 in. kerb should be laid on the flat. When set on edge a kerb is generally bedded on gravel with a mall; when laid on the flat a concrete bed is desirable.

In a macadamized street pitched or paved water channels are required to prevent the escape of water from the kerb. The pitchings consist of cubical blocks of hard stone about 4 in. deep, bedded on sand or mortar, or preferably on a bed of concrete. A paved channel consists of flat stones about 1 ft. wide. The edge of the stone is made slightly higher by the kerb. Moulded bricks and artificial stones are also used for the kerb. Such an inclination must be given to the channel as will bring the surface water to gullies placed at proper intervals, and the level of the kerb and consequently the footway will depend to some extent on the surface drainage as well as on the levels of adjacent houses. To lay out a street satisfactorily the longitudinal water transverse sections must be considered in relation to these matters as well as to the levels of intersecting streets.

ROAN (O. Fr. rouan, rouen; Ital. roano, roano; perhaps connected with rufus, red), a word applied to a variety of colour in an animal's coat, especially that of a horse, where there is a mixture of grey or white hair with the prevailing tint of bay, chestnut or sorrel. A sorrel when thus modified is either a strawberry- or a cream-roan. The term is used in the same way for a piece of material which is soft, fine, and a shade of scarlet; used in bookbinding as a substitute for, or in imitation of, morocco; but in this sense the origin is doubtful.

ROANNE, a town of east-central France, capital of an arrondissement in the department of Loire, on the left bank of the Loire, 54 m. N.W. of Lyons on the Paris-Lyons railway to Moulins. Pop. (1906) 33,981. The chief buildings are a modern town hall and the church of St Étienne (1835-1843), built in the Flamboyant Gothic style. The lycée occupies the buildings of the old college dating from the early 17th century. A fine bridge of seven arches connects Roanne with the industrial suburb of Le Coteau on the right bank of the river. The town is the seat of a sub-prefecture, of tribunals of first instance and of commerce, of a chamber of commerce and a board of trade-arbitration, and has lycées and gymnasiums. There are besides extensive engineering works, foundries, dye-works, tanneries, pottery and tile-works and other industrial establishments. As the centre of the Roannais coalfield, Roanne has coal and coke. It is also the terminus of the Roanne-Digoine Canal and the real starting point of the Loire navigation.

Roanne (Rodemna, or Roidemna) was an ancient city of the Segusii and a station on the great Roman road from Lyons to the ocean. In 1447 the lordship of Roannais became the property of the celebrated banker Jacques Cœur, from whom it passed as the result of a law-suit to the family of Gouffier. In their favour the title was raised to the rank of marquisate and in 1596 to the rank of duchy; it became extinct in the first half of the 18th century.

ROANOKE, a river of the South Atlantic Slope, U.S.A. With the Stauton, which rises in the Appalachian Valley in southwestern Virginia, it constitutes one river, and, flowing in a general south-westerly direction, crosses the boundary between Virginia and North Carolina just above the Fall Line and discharges into Albemarle Sound. It is nearly 400 m. long, with a drainage area of 9237 sq. m. The United States government adopted a project in 1871 for clearing a channel with a minimum depth of 5 ft. at low water from its mouth to Weldon, a distance of 129 m., and in 1909, when the project was 80% completed, vessels drawing 4 ft. of water could ascend to low stages nearly to Weldon. The main river and its principal tributary, the Dan, are also navigable, for many miles above the Fall Line, by pole boats. In 1829 the Weldon Canal, 12 m. long, was opened to afford a passage around the falls, but it was abandoned in 1850.

ROANOKE, a city in (but administratively independent of) Roanoke county, Virginia, on the Roanoke river, about 55 m. W.S.W. of Lynchburg. Pop. (1890) 16,159; (1900) 21,465. Indians of the Catawba tribe were the first Negroes; (1718 census) 34,873. Roanoke is served by the Virginia railway, by the main line and the Shenandoah and the Winston-Salem divisions of the Norfolk & Western railway, and by electric railway to Vinton and to Salem. The city is about 900 ft. above sea-level and is surrounded by high hills; its picturesque situation and its nearness to famous mineral springs make it a health resort. On a mountain slope, about ¾ m. from the city limits, is the Virginia College for Young Ladies; 7 m. north of the city, at what was
formerly called Botetourt Springs (there is a sulphur spring), is Hollins Institute (1842) for girls; and in the city are the National Business College, the City Hospital (1896), private hospitals, and St. Vincent's Orphan Asylum (1853) for boys, under the Sisters of Charity. Stock-raising, tobacco-growing, and coal and iron-mining are the industries of the district. Roanoke's factory product in 1905 was valued at $5,544,907 (2.7% more than in 1900). Its railway car repair and construction shops, belonging to the Norfolk & Western railway, employed in that year 66.9% of the total number of factory wage-earners; pig-iron, structural iron, canned goods, bottles, tobacco, planing-mill products and cotton are among the manufactures. The municipal water supply comes from a reservoir at Crystal Springs at the foot of Mill Mountain near the city limits. Roanoke was the town of Big Lick (founded about 1852; incorporated in 1874; pop. in 1880, 669) until 1882, when it received its present name; in 1884 it was chartered as a city.

**ROARING FORTIES.**

The name given to the zone in the southern hemisphere, near the 40th parallel of latitude, in which the northern-westerly “anti-trade” winds attain their greatest development. Since the belt lies in the Great Southern Ocean (g.e.), and is little interrupted by land, the “planetary circulation” undergoes little modification and barometric gradients are steep. The “bravo weather” are accordingly of great strength, and, as the corresponding belt of the northern hemisphere, the movement is largely broken up into the low and high pressure vortices known as cyclones and anticyclones.

**ROBBEN ISLAND.**

An island at the entrance of Table Bay, 7 m. N.N.W. of Cape Town. It is some 4 m. long by 2 broad. At its southern end is a lighthouse with a fixed light visible for 20 m. It got its name (robben, Dutch for seal) from the seals which formerly frequented it, now only occasional visitants. The island when discovered was uninhabited. It is first mentioned by an English seaman named Raymond, who states that in 1591 seals and penguins were there in large numbers. In 1614 ten criminals from London were landed on the island to form a settlement and supply fresh provisions to passing ships. The attempt, which ended in failure, is interesting as the first recorded settlement of Englishmen in South Africa. In the 16th century the slate quarries of Robben Island were extensively worked by the Dutch of Cape Town. The island is now noted for its leper asylum and its convict establishment. For many years an asylum for lunatics was also maintained, but in 1904 the lunatics were removed to the mainland. The common rabies of the island is from England, abounds, but its introduction to the mainland is prohibited. As early as 1657 criminals were banished to the island by the Dutch authorities at Cape Town; it has also served as the place of detention of several noted Kaffir chiefs.

**ROBBER SYNOD.**

The name given to an irregular ecclesiastical council held at Ephesus in A.D. 449. See EPHESUS, COUNCIL OF.

**ROBBERY** (from O. Fr. rober, to steal), the unlawful and forcible taking of goods or money from the person of another by violence or threatened violence. Robbery is larceny (g.e.) with violence. It is a specific offence under the Larceny Act 1861, and is punishable by penal servitude for any term not exceeding fourteen years and not less than three years, or imprisonment for any term not exceeding two years, with or without hard labour. Under the Carroccers Act 1863, whipping may be added as part of the sentence for robbery. In Scots law robbery is termed *shoatdrif*. Under the Act 1867, the nature of the offence is practically the same in America as in England, but what constitutes robbery is provided by statute in each state, as is also the punishment. The chief difference between English and American law is that the latter often divides the offences into grades and takes a liberal view of what constitutes force or fear. Train robbery is specially dealt with in some states owing to the prevalence of that species of crime.

**Federal Statute.**—Congress has made it piracy punishable with death to commit robbery on the high seas or on shore or in any harbour out of the jurisdiction of any state by landing from a piratical vessel (U.S. Rev. St. § 1047).

In Arizona, California and Missouri the "fear" may be that of the person robbed or of any relative of his or member of his family or of any one in his company. The punishment is imprisonment for not less than five years.

In Arkansas and Missouri extorting money or property by blackmail is an "attempt to rob"; it is punishable by not less than one nor more than five years' imprisonment. In Georgia larceny from the person is statutory robbery (Hickey v. State (1906), 125, Ga. 145).

Louisiana.—Train robbery is punishable by imprisonment for not less than five nor more than ten years.

Missouri.—Train robbery is punishable by death or imprisonment for not less than ten years. It may consist in placing an obstruction on the line with intent to rob.

New Jersey.—The extreme penalty for robbery is forty years' imprisonment (1905, ch. 114).

Texas.—Falsely personating an officer and by means of arrest extorting money is robbery (Burnside v. State (1807), 102, S. W. Rep. 179).

**ROBERT I. PERCIVAL.**

"THE BRUCE" (1274–1329), king of Scotland, was the son of the 7th Robert de Bruce, earl of Carrick by right of his wife Marjorie, daughter of Niel, or Nigel, earl of Carrick, and was the eighth in direct male descent from a Norman baron who came to England with William the Conqueror. After the death of Margaret, the "maid of Norway," in 1290, Bruce's grandfather, the 6th Robert de Bruce, lord of Annandale, claimed the crown of Scotland as the son of Isabella, the second daughter of David, earl of Huntingdon, and great-granddaughter of King David I.; but John de Balliol, grandson of Margaret, the elder Earl David, was preferred by the commissioners of Edward I.

The birthplace of Bruce is not certainly known, but was probably Turnberry, his mother's castle on the coast of Ayr. The date is the 11th of July 1274. His youth is said by an English chronicler to have been passed at the court of Edward I. At an age when the mind is quick to receive the impressions which give the bent to life he must have watched the progress of the great suit for the crown of Scotland. Its issue in 1292 in favour of Balliol led his grandfather to resign Annandale to his son, the 7th Robert de Bruce, who either then or after the death of his father in 1295 assumed the title of lord of Annandale. Already on his wife's death in 1292 he had resigned the earldom of Carrick to his son, the future king, who presented the deed of resignation to Balliol at Stirling in August 1293, and offered the homage with which his father, like his grandfather, was unwilling to render. Feudal law required that the king should take seisin of the earldom before regranting it and receiving the homage, and the sheriff of Ayr was directed to arrest Sir Robert de Bruce. As the disputes between Edward I. of England and Balliol, which ended in Balliol losing his kingdom, commenced in this year, it is doubtful whether Bruce ever rendered homage; but he is henceforth known as earl of Carrick, though in a few instances this title is still given to his father. Both father and son sided with Edward against Balliol. In April 1294 the younger Bruce had permission to visit Ireland for a year and a half, and as a further mark of Edward's favour a respite of all debts owing by him to the exchequer.

In August 1296 Bruce and his father swore fealty to Edward I. at Berwick, but in breach of this oath, which had been renewed
at Carlisle, the younger Robert joined Sir William Wallace, who raised the standard of Scottish independence in the name of Baliol and that king had surrendered his kingdom to Edward in 1306. Urgent letters were sent ordering Bruce to support John de Warenne, earl of Surrey, Edward's general, in the summer of 1307; but, instead of complying, he assisted to lay waste the lands of those who adhered to Edward. On the 27th of July Bruce and his friends were forced to make terms by a treaty called the capitulation of Irvine. The Scottish lords were not to serve beyond the sea against their will, and were pardoned for their recent violence, in return owning allegiance to Edward. The bishop of Glasgow, James the steward, and Sir Alexander Lindsay became sureties for Bruce until he delivered his daughter Marjorie as a hostage. Wallace almost alone maintained the struggle for freedom which the nobles, as well as Baliol, had given up, and Bruce had no part in the honour of Stirling Bridge in September 1307, or the reverse of Falkirk, where in July 1298 Edward in person recovered what his generals had lost, and drove Wallace and his countrymen out. Shortly afterwards Bruce appears again to have sided with his enemies. Annandale was wasted, while he, as Walter of Hemingford says, "when he heard of the king's coming, fled from his face and burnt the castle of Ayr which he held." Yet, when Edward was forced by home affairs to quit Scotland, Annandale and certain earldoms, including Carrick, were excepted from the districts he assigned to his followers, Bruce and other earls being treated as waverers whose allegiance might still be retained. About 1309 a regency was appointed in Scotland in the name of Baliol, and a letter of Baliol mentions Robert Bruce, lord of Carrick, as regent, along with William of Lamberton, bishop of St Andrews, and John Comyn the younger, a strange combination—Lamberton the friend of Wallace, Comyn the enemy of Bruce, and Bruce a regent in name of Baliol. Comyn in his own interest as Baliol's nephew and heir was the active regent; the insertion of the name of Bruce was an attempt to secure his co-operation. For the next four years he kept studiously in the background, waiting for his time. A statement of Peter Langtoft that he was at the parliament of Lincoln in 1301, when the English barons repudiated the claim of Pope Boniface VIII. to the suzerainty of Scotland, is not to be credited, though his father may have been there. In the campaign of 1304, when Edward renewed his attack on Scotland and reduced Stirling, Bruce supported the English king, who in one of his letters to him says, "If you complete that which you have begun, we shall hold the war ended by your deed and all the land of Scotland gained." But, while apparently aiding Edward, Bruce had taken a step which bound him to the patriotic cause. On the 11th of June, five weeks before the fall of Stirling, he met Lamberton at Cambuskenneth and entered into a secret bond by which they were to support each other against all adversaries and undertake nothing without consulting together. The death of his father in 1304 may have determined his course, and led him to prepare for the Scottish crown to his Edmunds of the four and the friendship of Edward. This determination closes the first chapter of his life; the second, from 1304 to 1314, is occupied by his contest for the kingdom, which was really won at Bannockburn, though disputed until the treaty of Northampton in 1328; the last, from 1314 to his death in 1329, was the period of the establishment of his government and dynasty by an administration as skilful as his generalship. It is to the second of these that historians, attracted by its brilliancy even amongst the many romances of history and its importance to Scottish history, have directed most of their attention, and it is during it that his personal character, tried by adversity and prosperity, gradually unfolds itself. But all three periods require to be kept in view to form a just estimate of Bruce. That which terminated in 1304, though unfortunately few characteristics, personal or individual, have been preserved, shows him by his conduct to have been the normal Scottish noble of the time. A conflict of interest and of bias led to contradictory action and this conflict was increased in his case by his father's residence in England, his own upbringing at the English court, his family feud with Baliol and the Comyns, and the jealousy common to his class of Wallace, the mere knight, who had rallied the commons against the invader and taught the nobles what was required in a leader of the people. The merit of Bruce is that he did not despise the lesson. Prompted alike by patriotism and ambition, at the prime of manhood he chose the cause of national independence with all its perils, and stood by it with an unwavering constancy until he secured its triumph. Though it is crowded with incident, the main facts in the central decade of Bruce's life may be rapidly told. The fall of Stirling was followed by the capture and execution of Wallace in London in August 1305. Edward hoped still to conciliate the nobles and gain Scotland by a policy of clemency to all who did not dispute his authority. A parliament in London in September 1305 to which Scottish representatives were summoned, agreed to an ordinance for the government of Scotland, which, though on the model of those for Wales and Ireland, treating Scotland as a third subject province under an English lieutenant, was in other respects not severe. Bruce is reputed to have been one of the advisers who assisted in framing it; but a provision that his castle of Kildrummy was to be placed in charge of a person for whom he should answer shows that Edward, not without reason, suspected his fidelity. The details of his final breach with the English king are somewhat obscure. According to one account, the bond between Bruce and Lamberton was revealed to Edward by Comyn while Bruce was at the English court. Alarmed by a hint dropped by Edward, he left England secretly, and in the church of the Friars Minorite at Dumfries on the 10th of February 1306 met Comyn, whom he slew before the high altar for refusing to join in his plans. So much is certain, though the precise incidents of the interview are variously told. It was not their first encounter; for a letter of 1295 to Edward from Scotland describes Comyn as having seized Bruce by the throat at a meeting at Peebles, where they were with difficulty reconciled by the regents.

The bond with Lamberton was now sealed by blood, and the confederates lost no time in putting it into execution. Within little more than six weeks Bruce, collecting his adherents in the south-west, passed from Lochmaben to Glasgow and thence to Scone, where he was crowned king of Scotland on the 27th of March 1306. Two days later Isabella, countess of Buchan, claimed the right of her family, the Macduffs, earls of Fife, to place the Scottish king on his throne, and the ceremony was repeated with an addition flattering to the Celtic race. Though a king, Bruce had not yet a kingdom, and his efforts to obtain it were disastrous failures until after the death of Edward I. In June 1306 he was defeated at Methven, and on the 11th of August he was surprised at Strathfillan, where he had taken refuge. The ladies of his family were sent to Kildrummy in January 1307, and Bruce, almost without a follower, fled to the island of Arran. For a time he was in the north in the following spring. On his way he granted the Scottish estates of Bruce and his adherents to his own followers, Annandale falling to Humphrey de Bohun, 4th earl of Hereford. At Carlisle there was published a bull excommunicating Bruce; and Elizabeth his wife, Marjorie his daughter, and Christina his sister, were captured in a sanctuary at Tain, while three of his brothers were executed. In a moment all was changed by the death of Edward I. on the 7th of July 1307. Instead of being opposed to the greatest, Bruce had now as his antagonist the feeblest of the Plantagenets. Quitting Rathlin, he had made a short stay in Arran, and before Edward's death had failed to take Ayr and T urnberry, although he defeated Aymer de Valence, earl of Pembroke, at Loudoun Hill in May 1306. After wasting the critical moment of the war in the diversions of court life, the new English king, Edward II., made an inglorious march to Cumnock and back without striking a blow; and then returned south, leaving the war to a succession of generals. Bruce, with the insight of military
ROBERT I.

397

genius, seized his opportunity. Leaving Edward, now his only brother in blood and almost his equal in arms, in Galloway, he suddenly transferred his own operations to Aberdeenshire. He overran Buchan either once or twice, and after a serious illness defeated the earl of Buchan, one of his chief Scottish opponents, near Inverurie on the 22nd of May 1308. Then crossing to Argyllshire he surprised another body of his enemies in the pass of Brander early in 1309, took Dunstaffnage, and in March of this year held his first parliament at St Andrews. In 1309 a truce scarcely kept was effectuated by Pope Clement V. and Philip IV. of France, and in 1310, in a general council at Dundee, the clergy of Scotland, all the bishops being present, recognized Bruce as king. The support given to him by the national church in spite of his excommunication must have been of great importance in that age, and was probably due to the example of Lambert. The next three years was signalized by the reduction one by one of the strong places still held by the English: Linlithgow towards the end of 1310, Dumbarton in October 1311, Perth, by Bruce himself, in January 1312. Previous to these two latter successes the king had made two raids into the north of England; after which Bannat, Dalmwinton and Dumfries were reduced, and Berwick was threatened. In March 1313 his lieutenant Sir James Douglas surprised Roxburgh, and Thomas Randolph surprised Edin-

burgh. In May Bruce was again in England, and though he failed to take Carlisle, he subdued the Isle of Man. About the same time Edward Bruce took Rutherglen and laid siege to Stirling, whose governor, Sir Philip de Mowbray, agreed to capitulate if not relieved before the 24th of June 1314.

Bruce's rapidity of movement was one cause of his success. His sieges, the most difficult part of medieval warfare, though won sometimes by stratagem, prove that he and his followers had benefited from their early training in the wars of Edward I. We know that he had been employed by that king to prepare the siege-train for his attack on Stirling in 1304. By the close of 1313 Berwick, Stirling and Bothwell alone remained English. Edward II. felt that if Scotland was not to be lost a great effort must be made. With the whole available feudal levy of England, and a contingent from Ireland, he advanced from Berwick to Falkirk, which he reached on the 22nd of June 1314. After a preliminary skirmish on Sunday the 23rd, in which Bruce distinguished himself by a personal combat with Sir Henry de Bohun, whom he fell by a single blow of his axe, the battle of Bannockburn was fought on Monday the 24th; and the complete rout of the English determined the independence of Scotland and confirmed the title of Bruce. The details of the day, memorable in the history of war as well as of Scotland, have been singularly well preserved, and are to the credit of Bruce, who had studied in the school of Wallace as well as in that of Edward I. He had chosen and knew his ground, lying between St Ninians and the Bannock, a petty burn, yet sufficient to produce marshes dangerous to heavily armed horsemen, while from the rising ground on his right the enemy's advance was seen. His troops were in four divisions: his brother Edward commanded the right, Randolph the centre, Douglas the left. Bruce with the reserve planted his standard at the Bore Stone, whence there is a bird's eye view of the field. His camp-followers on the Gilleys' Hill appeared over its crest at the critical moment which comes in all battles. The plain on the right of the marshes was prepared with pits and spikes. But what more than any other point of strategy made the fight famous was that the Scots fought on foot in battalions with their spears outwards, in a circular formation serving the same purpose as the modern square. A momentary success of the English archers was quickly reversed by a flank movement on the part of Sir Robert Keith. The Scottish bowmen followed up this advantage, and the fight became general; the English horse, crowded into too narrow a space, were met by the steady resistance of the Scottish pikemen, who knew, as Bruce had told them truly, that they fought for their country, their wives, their children, and all that freemen hold dear. The English rear was either unable to come up in the narrow space, or got entangled in the broken ranks of the van. The first repulse soon passed into a rout, and from a rout into a headlong flight, in which the English king himself barely escaped. In the career of Bruce, Bannockburn was the turning-point. The enthusiasm of the nation he had saved forgot his tardy adhesion to the popular cause, and at the parliament of Ayr on the 25th of April 1315 the succession was settled by an unanimous voice on him, and, failing males of his body, on his brother Edward and his heirs male, or failing them on his daughter Marjorie and her heirs, if she married with his consent. Soon afterwards she married Walter the steward (d. 1326). As a result of Bannockburn, Bruce's queen was restored to her husband; Stirling was delivered up to the Scots; the north of England was ravaged, and Carlisle and Berwick were besieged.

The last part of Bruce's life, from 1315 to 1329, began with an attempt which was the most striking testimony that could have been given to the effect of Bannockburn, and which, had it succeeded, might have altered the future of the British Isles. This was no less than the rising of the whole Celtic race, who felt that the year of the Lord had come and that freedom the Scots had won. In 1315 Edward Bruce crossed to Ireland on the invitation of the natives, and in the following year the Welsh became his allies. In the autumn of 1316 Robert came to his brother, and together they traversed Ireland to Limerick. Dublin was saved by its inhabitants committing it to the flames, and, though nineteen victories were won, of which that at Slane in Louth by Robert was counted the chief, the success was too rapid to be permanent. The brothers retreated to Ulster, and, Robert having left Ireland in May 1317 to protect his own borders, Edward, who had been crowned king of Ireland, was defeated and killed at Dundalk in October 1318. On his return Bruce addressed himself to the siege of Berwick, a standing menace to Scotland. While he was preparing for it two cardinals arrived in England with a mission from Pope John XXII. to effect a truce, or, failing that, to renew the excommunication of Bruce. The cardinals did not trust themselves across the border; their messengers, however, were enterprisingly received by Bruce, but with a firm refusal to lift the papal bulls into his kingdom because not addressed to him as king. Another attempt by Adam Newton, guardian of the Friars Minorite at Berwick, had a more ignominious result. Bruce admitted Newton to his presence at Aldcamus or Old Cambus, and informed him that he would not receive the bulls until his title was acknowledged and he had taken Berwick. On his return Newton was waylaid and his papers seized, not without suspicion of Bruce's connivance. In March 1318 the town and soon afterwards the castle of Berwick capitulated, and Bruce wasted the English border as far as Ripon. In December he held a parliament at Scone, where he displayed the same wisdom as a legislator which he had shown as a general. The death of his brother and his daughter rendered a resettlement of the crown advisable, and it was settled on his grandson, Robert, son of Marjorie and Walter the steward, in case Bruce died without sons, with a provision as to the regency in case of a minor heir in favour of Randolph. The defence of the country was next cared for by regulations for the arming of the whole nation, down to every one who owned the value of a cow, a measure far in advance of the old feudal levy. Exports during war, and of arms at any time, were prohibited. Internal justice was regulated, and it was declared that it was to be done to poor and rich alike. Leasing-making—a Scottish term for seditious language—was to be sternly punished. The nobles were exHORTed not to oppress the commons. Reforms were also made in the tedious technicalities of the feudal law. In September 1319 an attempt to recover Berwick was repelled by Walter the steward, and Bruce took occasion of a visit to com-

plain his son-in-law and raise the walls 10 ft.

The king's position was now so strong that foreign states began to testify their respect. Bruges and Ypres rejected a request of Edward II. to cut off the Scottish trade with Flanders. Pope John, who had excommunicated Bruce, was addressed
by the parliament of Arbroath in April 1320 in a letter which compared Bruce to a Joshua or Judas Maccabaeus, who had wrought the salvation of his people, and declared they fought “not for glory, truth or honour, but for that liberty which no virtuous man will survive.” Moved by this language and conscious of the weakness of Edward, the pope exhorted him to make peace with Scotland, and three years later Randolph, now earl of Moray, procured the recognition of Bruce as king from the papal see by promising aid for a crusade. In 1326 the French king, Charles IV., made a similar acknowledgment by the treaty of Corbeil. Meantime hostilities more or less constant continued with England, but, though in 1322 Edward made an incursion as far as Edinburgh, the internal weakness of his government prevented his gaining any real success, while in October of this year Bruce again ravaged Yorkshire, defeated the English near Byland, and almost captured their king. Some of his chief nobles—Thomas, earl of Lancaster, in 1321, and Sir Andrew Harclay, earl of Carlisle, in 1322—entered into correspondence with the Scots, and, though Harclay’s treason was detected and punished by his death, Edward was forced to make a truce of thirteen years at Newcastle on the 30th of May 1323, which Bruce ratified at Berwick. In 1327 Edward III. became king of England, and one of the first acts of the new reign, after a narrow escape of the young king from capture by Moray, was the treaty of York, ratified at Northampton in April 1328, by which it was agreed that “Scotland, according to its ancient bounds in the days of Alexander III., should remain to Robert, king of Scots, and his heirs free and divided from England, without any subjection, servitude, claim or demand whatsoever.” Joanna, Edward’s sister, was to be given in marriage to David, the infant son of Bruce, born subsequent to the settlement of 1318 and now recognized as heir to the crown, and the ceremony was celebrated at Berwick on the 12th of July 1328.

The chief author of Scottish independence barely survived his work. He appears to have conducted an expedition to Ireland in 1327, and on his return led a foray into England. His last years were chiefly spent at the castle of Cardross on the Clyde, which he acquired in 1326, and the conditions of peace, as well as the negotiations for peace, had been left to the young leaders, Moray and Sir James Douglas, whose training was one of Bruce’s services to his country. Ever active, he employed himself in the narrower sphere of repairing the castle and improving its domains and gardens, in building up the Clyde, and in the exercise of the virtues of hospitality and charity. The religious feeling, which had not been absent even during the struggles of manhood, deepened in old age, and took the form the piety of the times prescribed. He made careful provision for his funeral, his tomb, and masses for his soul. He procured from the pope a bull authorizing his confessor to absolve him even at the moment of death. He died at Cardross from leprosy, contracted in the hardships of earlier life, on the 7th of June 1329, and was buried at Dunfermline beside his second wife, Elizabeth (d. 1327), daughter of Richard de Burgh, earl of Ulster, whom he had married about 1304, and who bore him late his only son, David. Of two surviving daughters, Matilda married Thomas Ysaak, a noble esquire, and Margaret became the wife of William, earl of Sutherland. Marjorie, an only child by his first wife, Isabella, daughter of Donald, earl of Mar, had predeceased him. Several children not born in wedlock have been traced in the records, but none of them became in any way famous.

In fulfilment of a vow to visit the Holy Sepulchre, which he could not accomplish in person, Bruce requested Douglas to carry his heart not there, but his faithful follower perished on the way, fighting in its defence at B Lenovo, and the heart of Bruce, recovered by Sir William Keith, fouger, its representative, at Melroseton, when his corpse was disinterred in 1821 the breast-bone was found severed to admit of the removal of the heart, thus confirming the story preserved in the verses of Barbour. That national poet collected in the earliest Scottish poem, written in the reign of Bruce’s grand-son, the copious traditions which clustered round his memory. It is a panegyric; but history has not refused to accept it as a genuine representation of the character of the great king, in spirit, if not in every detail. Its dominant note is freedom—the liberty of the nation from foreign bondage, and of the individual from oppression. It is the same note which Tacitus embodied in the speech of Galagus at the dawn of Scottish history. Often as it has been heard before, and since in the course of history, seldom has it had a more illustrous champion than Robert the Bruce.

BIBLIOGRAPHY.—The chief contemporary authorities for the life of Bruce, as he is coloured by the nationality of the writers. On the Scottish side The Brus, a poem, edited by J. Stevenson (Edinburgh, 1839); also very important. The English chronicles which may be consulted with advantage are those of Walter of Hemingford, edited by H. C. Hamilton (London, 1848-49); and John Speed’s Theatre (London, 1866-68), and the Scotorum Genealogiae Thomas, vol. ii. (Edinburgh, 1836). For the documents of the time reference should be made to the Calendar of Documents relating to Scotland, edited by J. Bain (Edinburgh, 1881-88), Documents and Records Illustrative of the History of Scotland, vol. i., edited by P. Palgrave (London, 1837); the Rotuli Scotiae (London, 1814-19), and the Fœderum de Ty. Rymer, vol. i. (London, 1704). The chief general histories are: Sir D. D’Alrympyle, Lord Hailes, Annales of Scotland (Edinburgh, 1841); J. Bruce, History of Scotland, vol. i. (London, 1841-43); J. H. Burton, History of Scotland, vol. ii. (Edinburgh, 1895); A. Lang, History of Scotland, vol. i. (Edinburgh, 1904); R. Paul, Geschichte von England (Hamburg, 1834-38). See also Sir H. Maxwell, Robert the Bruce (London, 1897).

ROBERT II. (1316-1300), called “the Steward,” was a son of Walter, the steward of Scotland (d. 1326), and Marjorie (d. 1316), daughter of King Robert the Bruce, and was born on the 2nd of March 1316. In 1318 the Scottish parliament decreed that if King Robert died without sons the crown should pass to his grandson; but the birth of a son, afterwards King David II., to Bruce in 1324 postponed the accession of Robert for nearly forty-two years. Soon after the infant David became king in 1329, the Steward began to take a prominent part in the affairs of Scotland. He was one of the leaders of the Scottish army at the battle of Halidon Hill in July 1333; and after gaining some successes over the adherents of Edward Baliol in the west of Scotland, he and John Randolph, 3rd earl of Moray (d. 1346), were chosen as regents of the kingdom, while David sought safety in France. The colleagues of Robert, however, who fell into the hands of the English and Robert became sole ruler in Scotland, acting with such success in his efforts to restore the royal authority that the king was able to return to Scotland in 1341. Having handed over the duties of government to David, the Steward escaped from the battle of Neville’s Cross in 1346, and was again chosen regent while the king was a captive in England. Soon after this event some friction arose between Robert and his royal uncle. Accused, probably without truth, of desertion at Neville’s Cross, the Steward as heir-apparent was greatly chagrined by the king’s proposal to make Edward III. of England, or one of his sons, the heir to the Scottish throne, and by David’s marriage with Margaret Logie. In 1363 he rose in rebellion, and after having made his submission was seized and imprisoned together with four of his sons, being only released a short time before David’s death in February 1371. By the terms of the decree of 1318 Robert now succeeded to the throne, and was crowned at Scone in March 1371. His reign in unimportant. Some usurpations were taken by the nobles to control the royal authority. In 1378 he joined with England; but the king took no part in the fighting, which included the burning of Edinburgh and the Scottish victory at Otterbourne in 1388. As age and infirmity were telling upon him, the estates in 1389 appointed his second surviving son Robert, earl of Fife, afterwards duke of Albany, guardian of the kingdom. The king died at Dunonald on the 13th of May 1390, and was buried at Scone. His first wife was Elizabeth, daughter of Sir Robert Mure of Rowallan, a lady who had formerly been his mistress. By her he had at least four sons, the eldest of whom was his successor, King Robert III., and six daughters. By his second wife, Euphemia, daughter of Hugh, earl of Ross, and widow of Moray, formerly his
Robert III.—Robert of Naples

colleague as regent; he had two sons and several daughters; and he had also many illegitimate children.

Robert III. (c. 1340-1406), king of Scotland, was the eldest son of King Robert II. by his mistress, Elizabeth Mure, and was legitimated when his parents were married about 1340. In 1368 he was created earl of Carrick, and he took some part in the government of the kingdom until about 1387, when he was disabled by the kick of a horse. It was probably in consequence of this accident that his brother Robert, earl of Fife, and not the crown prince himself, was made guardian of the kingdom in 1386; but the latter succeeded to the throne on his father's death in May 1390. At this time he changed his baptismal name of John, which was unpopular owing to its connexion with John de Balliol, for that of Robert, being crowned at Scone in August 1390 as King Robert III. Although he probably attended several parliaments the new king was only the nominal ruler of Scotland, the real power being in the hands of the earl of Fife. In 1399, however, owing to the king's "sickness of the body," his elder son, David, duke of Rothesay, was appointed lieutenant of the kingdom; but this event was followed by an English invasion of Scotland, by serious differences between Rothesay and his uncle, Robert, now duke of Albany, and finally in March 1402 by Rothesay's mysterious death at Falkland. Early in 1406 the king's only surviving son, afterwards King James I., was captured by the English; and on the 4th of April 1406 Robert died, probably at Rothesay, and was buried at Paisley. He married Annabella Drummond (c. 1350-1402), daughter of Sir John Drummond of Stobhall, and, in addition to the two sons already mentioned, had four daughters.

Robert I. (c. 865-923), king of France, or king of the Franks, was the younger son of Robert the Strong, count of Anjou, and the brother of Odo, or Eudes, who became king of the western Franks in 888. Appointed by Odo ruler of several counties, including the county of Paris, and abbot in commendam of many abbeys, Robert also secured the office of prelate of the Franks, a military dignity of high importance. He did not claim the crown of France when his brother died in 898; but recognizing the supremacy of the Carolingian king, Charles III., the Simple, he was confirmed in his offices and possessions, after which he continued to defend northern France from the attacks of the Normans. The peace between the king and his powerful vassals was not seriously disturbed until about 921. The rule of Charles, and especially his partiality for a certain Hagono, had aroused some irritation; and, supported by many of the clergy and by some of the most powerful of the Frankish nobles, Robert took up arms, drove Charles into Lorraine, and was himself crowned king of the Franks at Reims on the 29th of June 922. Collecting an army, Charles marched against the usurper, and on the 15th of June 923, in a stubborn and sanguinary battle near Soisoans, Robert was killed, according to one tradition in single combat with his rival. Robert left a son, Hugh the Great, duke of the Franks, and his grandson was Hugh Capet, king of France.

Robert II. (c. 970-1013), king of France, was a son of Hugh Capet, and was born at Orleans. He was educated at Reims under Gerbert, afterwards Pope Silvester II. As the ideal of medieval Christianity he won his surname of "Pious" by his humility and charity, but he also possessed some of the qualities of a soldier and a statesman. His father associated him with himself in the government of France, and he was crowned in December 987, becoming sole king on Hugh's death in October 996. Robert's reign is chiefly remembered for its dramatic side. In 988 he had married Rosala, or Susanna, widow of Arnold II., count of Flanders. This lady, however, was much older than Robert, who repudiated her in 998, fixing his affections upon Bertha, daughter of Conrad the Peaceful, king of Burgundy, or Arles, and wife of Eudes I., count of Blois; and although the pair were related, and the king had been godfather to one of Bertha's children, they were married in 996, a year after the death of Eudes. Pope Gregory V., whose favour Robert vainly sought to win by allowing Arnulf, the imprisoned archbishop, to return to his see of Reims and forcing Gerbert to fly to the court of the emperor Otto III., excommunicated the king, and a council at Rome imposed a seven years' penance upon him. For five years the king braved all anathemas, but about 1002 he gave up Bertha and married Constance, daughter of a certain Count William, an intriguing and ambitious woman, who made life miserable for her husband, while the court was disturbed by quarrels between the partisans of the two queens. Still attached to Bertha, Robert took this lady with him to Rome in 1010, but the pope refused to recognize their marriage, and the king was forced to return to Constance. By this wife Robert had four sons, and in 1017, the eldest of these, Hugh, (1007-1025), was crowned as his father's colleague and successor. After Hugh's death the king procured the coronation of his second son, Henry, as co-regent. In 1024, however, having sold France, a proceeding which displeased Constance, who wished her third son, Robert (d. 1057), afterwards duke of Burgundy, to receive the crown. Robert's concluding days were troubled by a rising on the part of these two sons, and after a short war, in which he was worsted, the king died at Meulan on the 20th of July 1031. The notable gain to France during this reign was the duchy of Burgundy, which Robert claimed on the death of his uncle, Duke Henry, in 1001. The other claimant, however, Otto William, count of upper Burgundy, or Franche Comté, offered so stubborn a resistance that it was not until 1015 that the king secured the duchy, which he gave as an anaphage to his son Henry. Nevertheless, Robert himself kept a close oversight over its government, and this was one reason which led to the revolt of his sons in 1030. Owing to family quarrels, he could not prevent the kingdom of Burgundy, or Arles, from passing into the hands of the emperor Conrad II., and no serious results followed his interference in Flanders and Lorraine, which was secured to his royal dominion, and was greatly aided by the support of Richard II. and Richard III., dukes of Normandy, the latter of whom was his son-in-law.

His life was written by his chaplain, Helgaud, and this panegyric, Epitoma vitae Roberti regis, is published by J. P. Migne, in the Patrologia Latina, tome cxli. (Paris, 1844). See also C. Pfister, Etudes sur le règne de Robert le Pieux (Paris, 1885); and E. Lavisse, Histoire de France, tome ii. (Paris, 1901).

Robert (1275-1343), king of Naples, was the son of Charles II., duke of Anjou and king of Naples, and in his youth took part in several expeditions to Sicily with the object of wresting the island from Frederick III. of Aragon. But his efforts, like those of his father and grandfather, proved fruitless, and the Angevins were compelled at last to agree to the peace of Caltabellotta (1302). On the death of Charles in 1309 Robert succeeded to the throne, although his nephew Caroberto (Carlo Roberto), son of his elder brother Charles Martel, who had died before his father, had a prior claim. He was crowned by Pope Clement VI. at Avignon, and on the descent into Italy of the emperor Henry VII. was appointed papal vicar in Romagna to resist the imperialists; thenceforth he became the recognized leader of the Guelphs or papal faction in Italy and took part in all the wars against the Ghibellines. On various occasions he obtained for himself or his sons the suzerainity over Rome, Florence, and other cities, and was regarded as the most powerful Italian prince of his day. Pope John XXII. created him papal vicar in Italy against the emperor Louis the Bavarian. In 1320 Robert summoned his kinsman Philip V. of France to Italy, and he waged war against Sicily once more from 1325 to 1341, but failed to drive out the Aragonese. He died in 1343, just as he was about to lead another expedition to the island. Robert was a man of learning, devoted to
literature, and a generous patron of literary men: he befriended the poet Petrarch, who admired the king so greatly as to express the wish to see him lord of all Italy; while Boccaccio celebrated the virtues and charms of Robert's natural daughter Maria, under the name of Fiammetta. Dante was perhaps too severe on Robert, whom he described as a re da sermone (word king), and contemporary critics accused him of covetousness, a fault partly excused by his pressing need of money to pay the expenses of his perpetual wars. In spite of his power and influence, his position as a leader of the Guelfs was greatly shaken during the latter years of his reign, while at home he was never able completely to subjugate his rebellious barons.

See G. Villani, Cronache; M. Murena, Vita di Roberto d'Angiò, re di Napoli (Naples, 1770); and Archivio storico Siciliano (1884, viii. 512 seq.).

ROBERT, the name of two dukes of Normandy.

Robert I. (d. 1035), called Robert the Devil, was the younger son of Richard II., duke of Normandy (d. 1029), who bequeathed to him the county of Exmes. In 1028 he succeeded his brother, Richard III., whom he was accused of poisoning, as duke of Normandy. His time was mainly spent in fighting against his rebellious vassals. At his court Robert sheltered the exiled English princes, Edward, afterwards King Edward the Confessor, and his brother Alfred, and fitted out a fleet for the purpose of restoring them to their inheritance, but this was scattered by a storm. When returning from a pilgrimage to Jerusalem, he died at Nicaea on the 22nd of July 1035. His successor as duke was his natural son, William the Conqueror, afterwards king of England. In addition to winning for him his surname, Robert's strength and ferocity afforded material for many stories and legends, and he is the subject of several poems and romances (see ROBERT THE DEVIL below).

Robert II. (c. 1054-1134) was the eldest son of William the Conqueror. Although recognized in boyhood as his father's successor in Normandy, he was soon dissatisfied with his position, and about 1078, following a quarrel between his brothers and himself, he revolted. He was obliged to fly from his own country, but after a period of exile he returned, raised some troops, and began to harry the duchy, wounding his father during a skirmish at Gerberoi early in 1079. He was however, quickly forgiven, and passed two or three years in England and in Normandy until 1083, when he entered upon a second term of exile. When the Conqueror died in September 1087 Robert became duke of Normandy, but not king of England; although he received offers of help, he took no serious steps to displace his younger brother, King William II. In Normandy his rule was weak and irresolute. He lost the county of Maine, which for some years had been united with Normandy, and he was soon at variance with his brothers, the younger of whom, Henry, he seized and put into prison. In 1089 his duchy was invaded by William II., who, soon made peace with Robert, the two agreeing to dispossess their brother Henry of his lands in Normandy. This peace lasted until 1094, when occasions of difference again arose and another struggle began, Robert being aided by King Philip I. of France.

This warfare ended in 1096, when Robert set out on the first crusade, having raised money for this purpose by pledging his duchy to William II. as a surety. With his followers he journeyed to Constantinople; then he took part in the siege of Nicaea, the battle of Dorylaeum, and the famous battle under the walls of Antioch in June 1098. He shared in the siege of Jerusalem and other exploits of the crusade, while one account says that he was offered and refused the crown of the new Latin kingdom. Having won a great reputation both for valour and for generosity, the duke left Palestine and arrived in Normandy in September 1100.

William Rufus died while Robert was on his homeward way, and in Italy the Norman duke was greeted as king of England; but when he reached Normandy he learned that the English throne was already in the possession of Henry I. In July 1101 he crossed over to England, intending to contest his brother's title, but Henry met him near Alton, in Hampsire, and an amicable arrangement was made between them. Having received presents and the promise of a pension, Robert went quietly home. But the fraternal strife was not averted. Henry had interests in Normandy in addition to the county of Evreux, which Robert ceded to him about 1102. Visits were exchanged, but no lasting peace was made, and in 1106 the English king crossed over to Normandy, where Robert was in great extremities. At the battle of Tinchebrai, fought on the 28th of September 1106, Henry took his brother prisoner and carried him to England. For twenty-eight years the unfortunate duke was a captive, first in the Tower of London, and later in the castles of Devizes and Cardiff, but the evidence goes to show that he was not treated with cruelty. He died probably at Cardiff on the 10th of February 1134. Robert had a son, William, called the Clito, and several natural children. He was called Curthose, and also Gambaron, his figure being short and stout. Although wanting in decision of character, he was a skilled and able warrior, and the chroniclers tell many stories, some of them obviously legendary, of his exploits in the Holy Land.

The chief sources for the life of Robert II. are Ordericus Vitalis, William of Malmesbury and other chronicles of the time. See E. A. Freeman, History of the Norman Conquest (1870-76); and The Reign of Rufus (1882).

ROBERT GUICARD [i.e. "the resourceful"] (c. 1015-1085), the most remarkable of the Norman adventurers who conquered southern Italy. From 1016 to 1030 the Normans were pure mercenaries, serving either Greeks or Lombards, and then Sergius of Naples, by installing the leader Rainulf in the fortress of Aversa in 1030, gave them their first à-terre and they began an organized conquest of the land. In 1030 there arrived William and Drogo, the two eldest sons of Tancred of Hauteville, a petty noble of Countains in Normandy. The two joined in the organized attempt to wrest Apulia from the Greeks, who by 1040 had lost most of that province. In 1042 Melfi was chosen as the Norman capital, and in September of that year the Normans elected as their count William "Iron Arm," who was succeeded in turn by his brothers Drogo, "comes Normannorum totius Apulieae et Calabriae," and Humfrey, who arrived about 1044. In 1046 arrived Robert, the sixth son of Tancred of Hauteville. His tall stature, blonde colouring and powerful voice are strikingly described by Anna Commena.

Guiscard soon rose to distinction. The Lombards turned against their allies and Leo IX. determined to expel the Norman freebooters. The army which he led towards Apulia in 1053 was, however, overthrown at Civitate on the Fortore by the Normans united under Humphrey, Guiscard and Richard of Aversa. In 1057 Robert succeeded Humphrey as count of Apulia and, in company with Roger his youngest brother, carried on the conquest of Apulia and Calabria, while Richard conquered the principality of Capua. The Papacy, foreseeing the breach with the emperor over investitures, now resolved to recognize the Normans and secure them as allies. Therefore at Melfi, on the 23rd of August 1059, Nicholas II. invested Robert with Apulia, Calabria, and Sicily, and Richard with Capua. Guiscard "by Grace of God and St Peter duke of Apulia and Calabria and, through the Lord, Sicily," agreed to hold perpetual rent of the Holy See and to maintain its cause. In the next twenty years he made an amazing series of conquests. Invading Sicily with Roger, the brothers captured Messina (1061) and Palermo (1072). Bari was reduced (April 1071) and the Greeks finally ousted from southern Italy. The territory of Salerno was already Robert's; in December 1076 he took the city, expelling its Lombard prince Gisulf, whose sister Sikelgaita he had married. The Norman attacks on Benevento, a papal fief, alarmed and angered Gregory VII., but pressed hard by the emperor, Henry IV., he turned again to the Normans, and at Ceprano (June 1080) he reinvested Robert, securing him also in the southern Abruzzi, but reserving Salerno. Guiscard's last enterprise was his attack on the Greek Empire, a rallying ground for his rebel vassals. He
contemplated seizing the throne of the Basileus and took up the cause of Michael VII, who had been deposed in 1078 and to whose son his daughter had been betrothed. He sailed with 16,000 men against the empire in May 1081, and by February 1082 had occupied Corfu and Durazzo, defeating the emperor Alexis before the latter (October 1081). He was, however, recalled to the aid of Gregory VII, besieged in San Angelo by Henry IV. (June 1083). Marching north with 36,000 men he entered Rome and forced Henry to retire, but an émigré of the citizens led to a three days' sack of the city (May 1084), after which Guiscard escorted the pope to Rome. His son Bohemund, for a time master of Thessaly, had now lost the Greek conquests. Robert, returning to restore them, occupied Corfu and Kephallonia, but died of fever in the latter on the 15th of July 1085, in his 70th year. He was buried in S. Trinitalia at Venosa. Guiscard was succeeded by Roger "Borsa," his son by Skelgaita; Bohemund, his son by an earlier Norman wife Alberada, being set aside. At his death Robert was duke of Apulia and Calabria, prince of Salerno and suzerain of Sicily. His successes had been due not only to his great qualities but to the "entente" with the Papal See. He created and enforced a strong ducal power which, however, was met by many baronial revolts, one being in 1078, when he demanded from the Apulian vassals an "aid" on the betrothal of his daughter. In conquering such wide territories he had little time to organize them internally. In the history of the Norman kingdom of Italy Guiscard remains essentially the hero and founder, as his nephew Roger II. is the statesman and organizer.

ROBERT OF AUXERRE (c. 1156-1212), French chronicler, was an inmate of the monastery of St. Marien at Auxerre. At the request of Milo de Trinay (1155-1302), abbot of this house, he wrote a Chronicon, or universal history, which covers the period between the creation of the world and 1211. For the years previous to 1185 this is merely a compilation from Prosper of Aquitaine, Siegbert of Gembloux and others, but it is an original authority for the period from 1185 to 1211.

It is one of the most valuable sources for the history of France during the reign of Philip Augustus, and it also contains information about other European countries, the Crusades and affairs in the East. Molinier, in fact, describes the author as one of the best historians of the middle ages. Robert was evidently a man of great diligence and of sound judgment. Two continuators took the work down to 1228 and it was extensively used by later chroniclers. The original manuscript is now at Auxerre.

The Chronicon was first published by N. Camusat at Troyes in 1662, and reprinted in Band xvi. of the Monumenta Germaniae historica. Scriptores, with introduction by A. Holder-Egger. Robert has been identified, but on very questionable grounds, with a certain Robert Abolant, an official of the monastery of St. Marien at Auxerre. See A. Schuchardt, Les sources de l'histoire de France, tomes iii. and iv. (1902-1904).

ROBERT OF COURTENAY (d. 1228), emperor of Romania, or Constantinople, was a younger son of the emperor Peter of Courtenay, and was descended from the French king, Louis VI, while his mother Yolande was a sister of Baldwin and Henry of Flanders, the first and second emperors of Constantinople. When it became known in France that Peter of Courtenay was dead, his eldest son, Philip, marquis of Namur, renounced the succession to the Latin empire of Constantinople in favour of his brother Robert, who set out to take possession of his distracted inheritance, which was then ruled by Canon of Béthune as regent. Crowned emperor on the 25th of March 1221, Robert, who was surrounded by enemies, appealed for help to the pope and to the king of France; but meanwhile his lands were falling into the hands of the Greeks. Some little

aid was sent from western Europe, but soon Robert was compelled to make peace with his chief foe, John, Duke of Vatases, emperor of Nicaea, who was confirmed in all his conquests. Robert promised to marry Eudoxia, daughter of the late emperor of Nicaea, Theodore Lascaris I, a lady to whom he had been betrothed on a former occasion; however, he soon repudiated this engagement, and married a French lady, already the fiancée of a Burgundian gentle.
St. Michel, whence he is also sometimes called Robertus de Normandy, and by the time he was twenty a prodigy of strength, which he used, however, only for outrage and crime. At last he learnt from his mother, in explanation of his wicked impulses, that he was born in answer to prayers addressed to the devil. He was directed by the pope to a hermit, who imposed on him by way of penance that he should maintain absolute silence, feign madness, take his food from the mouth of a dog, and provoke ill-treatment from the common people without retaliating. He became court fool to the emperor at Rome, and delivered the city from Saracen invasions in three successive years in the guise of an unknown knight, having each time been hidden to fight by a celestial messenger. The emperor's dumb daughter recovered speech to declare the identity of the court fool with the deliverer of the city, but Robert refused the hand of the princess and the imperial inheritance, and ended his days in the hermitage of his old confessor.

The French romance of Robert le Diable is one of the oldest versions of the legend, and differs in detail from the popular tales printed in the 15th and 16th centuries. It was apparently founded on folk-lore, not on the wickedness of Robert Guiscard or any historical personage; but probably the name of Robert and the localization of the legend may be put down to the terror inspired by the Normans. In the English version the hero is called Sir Gwther, and the scene is laid in Germany. This metrical romance dates from the beginning of the 15th century, and is based, according to its author, on a Breton lay. The legend had undergone much change before it was used by E. Scribe and C. Delavigne in the libretto of Meyerbeer's opera of Robert le Diable.

See Robert le Diable, ed. L. Lösth (Paris, 1893, for the Soc. des anciens textes fr.); Sir Gwther, etc., by K. Brem (Oppeln, 1886); M. Tardel, Die Sage v. Robert d. Teufel in neueren deutschen Dichtungen (Berlin, 1900). Brem's edition of the English poem contains an examination of the legend, and a bibliography of the literature dealing with the subject. The English prose romance of Robert the Devil was published (c. 1510) by Wynken de Worde.

ROBERT THE STRONG (le Fort) (d. 866), count of Anjou and of Blois, is said by Richerus to have been the son of a certain Witchin, but nothing definite is known about his parentage or early life. Quickly attaining a prominent position among the Frankish nobles, he appears as rector of the abbey of Marmoutier in 852, and as one of Charles the Bald's missi dominici, in 853; but soon afterwards he was among those who rebelled against Charles, and invited the king's half-brother, Louis the German, to invade West Francia. However, after the peace between Charles and Louis in 860 Robert came to terms with his sovereign, who made him count of Anjou and of Blois, and entrusted him with the defence of that part of his kingdom which lay between the Seine and the Loire, a district which had suffered greatly from the ravages of the Normans and the Bretons. By his conduct in many stubborn fights with these foes, Robert thoroughly earned his surname and gained the confidence of the king, who gave him the counties of Nevers and Auxerre. He was killed in battle at Brissarthe in October 866, leaving two sons, Odo, or Eudes, and Robert, both of whom became kings of the Franks. Robert has been compared to the Maccabees and the fact that he was the ancestor of the Capetian kings of France has invested him with historical importance.

See K. von Kalestein, Robert der Täferre (Berlin, 1871); and E. Favre, Eudes, comte de Paris et roi de France (Paris, 1893).

ROBERT, HUBERT (1753–1808), French artist, born at Paris in 1753, deserves to be remembered not so much for his skill as a painter as for the liveliness and point with which he treated the subjects he painted. The contrast between the ruins of ancient Rome and the life of his time excited his keenest interest; and, although he had started for Italy on his own responsibility, the credit he there acquired procured him the protection of the minister Marigny and an official allowance. His incessant activity as an artist, his daring character, his many adventures, attracted general sympathy and admiration. In the fourth canto of his L'Imagination Delille celebrated Robert's miraculous escape when lost in the catacombs; later in the book he was imprisoned during the Terror and marked for the guillotine; but fate intervened and he neither died in his place and Robert lived. The quantity of his work is immense; the Louvre alone contains nine paintings by his hand and specimens are frequently to be met with in provincial museums and private collections. Robert's work has more or less of that scenic character which justified his selection by Voltaire to paint the decorations of his theatre at Ferney. Robert died of apoplexy on the 1st of April 1808. His work was much engraved by the abbé Le Non, with whom he had visited Naples in the company of Fragonard during his early days; in Italy his work has also been frequently reproduced by Chatelain, Lénard, Le Veu, and others.

See C. Blanc, Histoire des peintres; Villot, Notice des tableaux du Louvre; Julius Meyer, Geschichte der Malerei.

ROBERT, LOUIS LÉOPOLD (1794–1833), French painter, was born at Chaux de Fonds (Neuchâtel) in Switzerland on the 19th of May 1794, but lost his native place with the engraver Girardet at the age of sixteen for Paris. He was on the eve of obtaining the grand prix for engraving when the events of 1815 blasted his hopes, for Neuchâtel was restored to Prussia, and Robert was struck off the list of competitors as a foreigner. Whilst continuing his studies under Girardet he had never ceased to frequent the studio of David, and he now determined to become a painter, and only returned to his native country when his master himself was exiled. At Neuchâtel he attracted the notice of Roullet de Mezerac, who enabled him by a timely loan to proceed to Rome. In depicting the customs and life of the people, of southern Italy especially, he showed peculiar feeling for the historical characteristics of their race. After executing many detached studies of Italian life Robert conceived the idea of painting four great works which should represent at one and the same time the four seasons in Italy and the four leading races of its people. In the "Return from the Fête of the Madonna della Arca" (Louvre) he depicted the Neapolitans and their gaiety. This picture, exhibiting to the public another, achieved undoubted success and was bought for the Luxembourg by Charles X.; but the work which appeared in 1831—the "Summer Reapers arriving in the Pontine Marshes" (Louvre), which became the property of Louis Philippe—established the artist's reputation. Florence and her autumn vineyards should now have furnished him with his third subject. He attempted to begin it, but, unable to conquer his passion for Princess Charlotte Napoleon (then mourning the violent death of her husband, Robert's devoted friend), he threw up his work and went to Venice, where he began and carried through the fourth of the series, the "Fishers of the Adriatic." This work was not equal to the "Reapers." Worn by the vicissitudes of painful feeling, and bitterly discouraged, Robert committed suicide before hisease on the 24th of March 1835, on the tenth anniversary of the melancholy suicide of a brother to whom he had been much attached.
ROBERT-FLEURY—ROBERTS, EARL

ROBERT-FLEURY, JOSEPH NICOLAS (1797–1890), French painter, was born at Cologne. He was sent by his family to Paris, and after travelling in Italy returned to France and made his first appearance at the Salon in 1824; his reputation, however, was not established until three years later, when he exhibited “Tasso at the Convent of St Onofrius,” endowed with a vigorous original talent, and with a vivid imagination, especially for the tragic incidents of history, he soon rose to fame, and in 1830 succeeded Granet as member of the Académie des Beaux-Arts. In 1835 he was appointed professor and in 1863 director of the École des Beaux-Arts, and in the following year he went to Rome as director of the French Academy in that city. Among his chief works are: “A Reading at Mme. de Sévigné’s,” “Scene of St Bartholomew,” “Henry IV. taken to the Louvre after his Assassination” (1836); “Triumphal Entry of Clovis at Tours” (1838), at the Versailles Museum; “Le Colloque de Poiocy” (1840), at the Luxembourg Museum in Paris; “The Children of Louis XVI. in the Temple” (1840); Marino Faliero; “An Auto-da-fé;” “Galileo before the Holy Office,” at the Luxembourg Museum; Christopher Columbus received by the Spanish Governor” (1847); Galatea; “The Last Moments of Montaigne” (1853); and “Charles V. in the Monastery of Yuste” (1857). He died in Paris in 1890.

His son, TONY ROBERT-FLEURY (1837– ), French painter, was born in Paris, and studied under his father and under Delaroche and Léon Coignet. His first picture at the Salon, in 1866, was a large historical composition of the “Warsaw Massacres on April 8, 1861.” In the following year his “Old Women in the Place Navone, Rome” was bought for the Luxembourg Museum, as was also the “Last Day of Corinth” in 1870. In 1880 he painted a ceiling for the Luxembourg, representing “The Glorification of French Sculpture.” Tony Robert-Fleury became president of the Société des Artistes français in succession to Bouguereau. He acquired a great reputation for his historical compositions and portraits; and from his atelier have issued a great number of the best-known painters of our day.

ROBERTS, DAVID (1796–1864), Scottish painter, was born at Stockbridge, Edinburgh, on the 24th of October 1796. He was apprenticed by his father, a shoemaker, for seven years to a painter and house-decorator; and during this time he employed his evenings in the study of art. In 1818 he entered the acquaintance of Clarkson Stanfield; then painting in the Pantheon, Edinburgh, at whose suggestion he sent three pictures in 1822 to the Exhibition of Works by Living Artists, held in Edinburgh. In the same year he removed to London, where he worked for the Coburg Theatre, and was afterwards employed, along with Stanfield, at Drury Lane. In 1824 he exhibited at the British Institution a view of Dryburgh Abbey, and sent two works to the first exhibition of the Society of British Artists, of which he was elected president in 1831. In the same autumn he visited Normandy, and the works which were the results of this excursion began to lay the foundation of the artist’s reputation—one of them, a view of Rouen Cathedral, being sold for eighty guineas. His scenes for an opera, The Seraglio, executed two years later, and the scenery for a pantomime dealing with the naval victory of Navarino, and two panoramas executed jointly by him and Stanfield, were among his last work for the theatres. In 1829 he exhibited the “Departure of the Israelites from Egypt,” in which his style first becomes apparent; three years afterwards he travelled in Spain and Tangiers, returning in the end of 1833 with a supply of effective sketches, elaborated into attractive and popular paintings. His “Interior of Seville Cathedral” was exhibited in the British Institution in 1834, and sold for £100; and he executed a fine series of Spanish illustrations for the “Landscape Annual of 1836, while in 1837 a selection of his Picturesque Sketches in Spain was reproduced by lithography.

In 1838 Roberts made a long tour in the East, and accumulated a vast collection of sketches of a class of scenery which had hitherto been hardly touched by British artists, and which appealed to the public. All the following ten years of his life were mainly spent in elaborating these materials. An extensive series of drawings was lithographed by Louis Haghe in Sketches in the Holy Land and Syria, 1842–1849. In 1851, and again in 1853, Roberts visited Italy, painting the “Ducal Palace, Venice,” bought by Lord Londenborough, the “Interior of the Basilica of St Peter’s, Rome,” “Christmas Day, 1853,” and “Rome from the Convent of St Onofrio,” presented to the Royal Scottish Academy. His last volume of illustrations, Italy, Classical, Historical and Pictmesque, was published in 1859. He also executed, by command of Queen Victoria, a picture of the opening of the Great Exhibition of 1851. In 1859 he was elected an associate and in 1861 a full member of the Royal Academy; and in 1858 he was presented with the freedom of the city of Edinburgh. The last years of his life were occupied with a series of views of London from the Thames. He had executed six of these, and was at work upon a picture of St Paul’s Cathedral, when, on the 25th November 1864, he died suddenly of apoplexy.

ROBERTS, FREDERICK SLEIGH ROBERTS, EARL (1832– ), British soldier, second son of General Sir Abraham Roberts, G.C.B., was born at Cawnpore, India, on the 30th of September 1832. Educated at Eton, Sandhurst and Addiscombe, he obtained a commission in the Bengal Artillery on 12th December 1851. In the following year he was posted to a field battery at Peshawar, where he also acted as aide-de-camp to his father, who commanded the Peshawar division. In 1856 Roberts was appointed to the quartermaster-general’s department of the staff, in which he remained for twenty-two years, passing from one grade to another until he became quartermaster-general in India. On the outbreak of the Mutiny in 1857, Roberts, at first, was staff officer to the movable column operating against the mutineers in the Punjab, successively commanded by Colonels Neville Chamberlain and John Nicholson, but, towards the end of June, he joined the Delhi Field Force, and was deputy assistant quartermaster-general with the artillery during the operations against Delhi. He was wounded in the fight of the 14th of July, but was sufficiently recovered in September to take command as a regimental officer of the left half of No. 2 Siege Battery during the siege. He rejoined the headquarters staff for the assault, and took part in the storm and subsequent seven days’ fighting in the city. He then accompanied Colonel Greathed’s column to Cawnpore, and during September and October was present at the actions of Bulundshahr, Aligarh, Agra, Bithur and Kanauj. He served under Sir Colin Campbell at the second relief of Lucknow in November, at the battle of Cawnpore on the 6th of December, and the subsequent pursuit and defeat of the Gwalior contingent near Shinarajpur. Roberts distinguished himself at the engagement of Khudaganj, on the 2nd of January 1858, by capturing, in single-handed combat, a standard from two sepoys, and also by cutting down a sepoy about to kill a sowar. For these acts of gallantry he was recommended for the Victoria Cross. He was present at the reoccupation of Fathagarh on the 6th of January, the storm of Mianganj in February, the siege and capture of Lucknow in March, and the action at Kursi on the 22nd of that month, after which he went home on sick leave. For his services in the Mutiny he was seven times mentioned in despatches, received the medal with three clasps, the Victoria Cross, and on his promotion to captain, in October 1860, a brevet majority. On the 17th of May 1859 he married, at Waterford, Miss Nora Bews, and on his return to India was entrusted with the organization of the victor’s camps during the progresses through Dudh, the North-West Provinces, the Punjab and Central India in 1860 and 1861. In December 1863 he took part, under
Major-General Garvock, in the Umbeya campaign among the mountains to the north of Peshawar, and was present at the storm of Lalu, the capture of Umbeya, and the destruction of Mulka, receiving for his services the medal and clasp.

In 1867 Roberts was appointed assistant quartermaster-general to Sir Donald Stewart's Bengal Brigade for Abyssinia. He showed judgment in embarking each unit complete in every detail, instead of despatching camp equipage in one ship, transport in another, and so on, as was customary. He arrived at Zula, Annesley Bay, in the Red Sea, the base of the expedition, on the 3rd of February 1866, and remained there as senior base staff officer during the four months' campaign. At its close he superintended the re-embarkation of the whole army. His duties were so well performed that Sir Robert Napier sent him home with his final despatches. He was three times "mentioned," and received a brevet lieutenant-colonelcy and the war medal. He returned to India the following year as first assistant quartermaster-general. In the autumn of 1871 he made the arrangements for the expedition into Lushal, between south-east Bengal and Burma, fitted out two columns under Brigadiers-General Bourchier and Brownlow, and himself accompanied the first. A road, 100 m. long, was cut through dense gloomy forests in stifling heat, and the column was attacked by cholera; but the object of the expedition was successfully accomplished, and Roberts, who was present at the capture of the Kohelo villages and the action in the Northlang range, and commanded the troops at the burning of Taikum, was mentioned in despatches and made a Companion of the Bath. On his return in March 1872, he became deputy quartermaster-general in Bengal, and in 1875 quartermaster-general and colonel. He settled the details of the great camp of exercise at Delhi on the occasion of the visit of the Prince of Wales in January 1876, and attended H.R.H. at the manoeuvres. He also superintended the arrangements for the great durbar at Delhi on the 1st of January 1877, when Queen Victoria was proclaimed empress of India.

In 1875 Roberts was appointed to the command of the Frontier Field Force at Abbottabad, in Hazara; but in the autumn, on the repulse of the Chamberlain Mission by the Afghans, and the formation of three columns to advance into Afghanistan by the Khyber, the Bolan and the Kurram passes, he was given the command of the Kurram Field Force, with the rank of major-general. Concentrating his column at Thal, he advanced to Kurram towards the end of November, and having formed an advanced base there, moved on to Habib Kila. Under cover of preparations for a front attack on the Peiwar Kotal, he reconnoitred that formidable position, and on the night of the 1st of December moved part of his force to attack the Spingwi Kotal, in order to turn the Afghan left flank, leaving the remainder of the force to feign a front attack on the Peiwar, and to guard the camp. After a very difficult night march the Spingwi Kotal was carried at daybreak on the 2nd, and, later, the Afghans on the Peiwar Kotal, threatened in rear, abandoned the position. The next morning Roberts occupied the Peiwar, and on the 6th advanced to Ali Khel. He then formed the Kurram and the Sapiari passes, and made a strong reconnaissance through Khost, in which some fighting took place, and at the end of January returned to Haig Pir, in Kurram, where his force remained in occupation. In July Major Cavagnari, the British envoy to the new Amir, Yakub Khan, passed through Kurram on his way to Kabul, and, shortly afterwards, Roberts left his Kurram command and went to Simla to take his seat on the army commission, where he strongly advocated the abolition of the three Presidency armies, and the substitution for them of four army corps, a measure which was carried out sixteen years later. While he was at Simla, news arrived on the 5th of September of the murder of Cavagnari and his companions at Kabul. The Peshawar Valley Force had been broken up; Sir Donald Stewart was still at Kandahar, but most of his troops had started for India; Roberts, therefore, had the only force ready to strike rapidly at Kabul. It was hastily reinforced, and he hurried back to Kurram to take command, as a lieutenant-general, of the Kabul Field Force (7500 men and 22 guns). By the 9th of September a brigade was entrenched on the Shutargardan, and as Roberts advanced, the Amir Yakub Khan came into his camp. An Afghan force of 8000 men blocked the way in a strong position on the heights beyond Charsia, and on the 6th of October Roberts repeated the tactics that had done him such good service at the Peiwar in the previous year, and sending Brigadier-General T. D. Baker with the greater part of his force to turn the Afghan right flank, threatened the pass in front with the remainder. By the afternoon Baker had seized the position, and the enemy, severely defeated, were in full retreat. Kabul was occupied without further opposition.

The city was spared, but punishment was meted out to those convicted of complicity in the murder of the British Mission. Yakub Khan abdicated on the 12th of October, and was eventually deported to India. The troops occupied the Sherpur cantonments; but in November a religious war was proclaimed by the Mullahs, and early in December, in order to prevent a threatened combination of Afghan tribes against him, Roberts moved out two columns to attack them in detail. After considerable fighting around Kabul, the numbers of the enemy were so great that he was forced to concentrate his troops again at Sherpur, the defences of which had been greatly improved and strengthened. Sherpur was invested by the enemy, and early on the 23rd of December was attacked by over 100,000 Afghans. They were driven off with great loss; and on making a second attempt to storm the place, were met by Roberts, who moved out, attacked them in flank, and defeated them, when they broke and dispersed. Roberts now recommended the political dismemberment of Afghanistan, and negotiations were carried on with the northern tribes for the appointment of an Amir for the Kabul district only. On the 5th of May Sir Donald Stewart arrived with his column from Kandahar and assumed the supreme command in Afghanistan, Roberts retaining, under Stewart, the command of the two Kabul Divisions, and organizing an efficient transport corps under Colonel R. Low, which was soon to be of inestimable value. On the 22nd of July Abdur Rahman was proclaimed Amir of Kabul; and Roberts was preparing to withdraw his troops to India by the Kurram route, when news arrived that a British brigade had been totally defeated at Maiwand on the 27th of July, and that Lieutenant-General Primrose was besieged in Kandahar. Roberts ordered to proceed thither at once with a specially selected column of 10,000 troops and his new transport corps. He started on his famous march on the 9th of August and arrived at Kandahar on the morning of the 31st, having covered 313 miles in twenty-two days. On the following day he fought the battle of Kandahar and gained a complete victory. His services in the Afghan campaigns of 1878 to 1880 are recorded in eight Gazettes, and were recognized by the thanks of both Houses of Parliament, of the Government of India, and of the Governor-General in Council. He was created K.C.B., G.C.B. and a baronet, received the medal with four clasps and the bronze star, and was given the command of the province of Zululand.

Before proceeding to Madras, Roberts went home on furlough, and when the news of the disaster at Majuba Hill in South Africa arrived in London at the end of February 1881, he was appointed governor of Natal and commander-in-chief in South Africa. He arrived at Cape Town to find that peace had been made with the Boers, and that instructions were awaiting him to return home. The same year he attended the autumn manoeuvres in Hanover as the guest of the German emperor. He declined the post of quartermaster-general to the forces in succession to Sir Garnet Wolseley, and returned to India, arriving at Madras in November. The following year he visited Burma with the viceroy, and in 1885 attended the meeting between Abdur Rahman and Lord Dufferin at Rawalpindi at the time of the Panjdeh incident, in connexion with which he had been nominated to the command of an army corps in
ROBERTSON, F. W.—ROBERTSON, G. C.

case of hostilities. In July he succeeded Sir Donald Stewart as commander-in-chief in India, and during his seven years' tenure of this high position instituted many measures for the benefit of the army, and greatly assisted the development of frontier communications and defenses. At the end of 1886, at the request of the viceroy, he took personal command for a time of the forces in Burmah, and organized measures for the suppression of dacoity. For his services he received the medal, was created G.C.I.E., and promoted supernumerary general. In 1890 he did the honors of the army to Prince Albert Victor at a standing camp at Muridki, and in 1891 his attention was occupied with the Zhob and Hunza Nagar frontier campaigns. On the 1st of January 1892 he was raised to the peerage as Baron Roberts of Kandahar and Waterford. In 1893 he left India for good, and the G.C.S.I. was bestowed upon him. He was promoted to field-marshali 1895, and in the autumn of that year succeeded Lord Wolseley in the Irish command and was sworn a privy councillor. At Queen Victoria's diamond jubilee in 1897 he was created K.P.

After the disastrous actions in the Boer war in South Africa in December 1899 at Magersfontein, Stormberg and Colseno, where his only son was killed, Lord Roberts was sent out as commander-in-chief. He arrived at Cape Town on the 10th of January 1900, and after organizing his force, advanced with sound strategy on Bloemfontein, the capital of the Orange Free State, and managed to an extent of affairs. The sieges of Kimberley and Ladysmith were raised, and the Boer general, Cronje, flying towards the capital, was overtaken at Paardeberg and, after a fine defence, compelled to surrender, with 5000 men, on the anniversary of Majuba Day, the 27th of February 1900. Roberts entered Bloemfontein on the 13th of March, and after six weeks' preparation, advanced on Pretoria, the capital of the Transvaal. Mafeking was relieved on the 17th of May, and Pretoria occupied on the 5th of June. The two Boer states were annexed, and the war gradually assuming a guerilla character, Roberts handed over the command to Lord Kitchener and returned to England to fill the office of commander-in-chief of the army in succession to Lord Wolseley.

He arrived in the Solent on the 2nd of January 1901, and the same day, at Osborne, had an audience of Queen Victoria, who handed him the insignia of the Order of the Garter. The next day he was received at Paddington by the prince and princess of Wales, and drove in procession to Buckingham Palace, where he was entertained as the guest of the queen. He again had an audience of the queen at Holyrood Palace on the 14th of January and was presented to the earlom, the last audience given for her majesty before her death, which took place eight days later. When the German emperor came to London for the queen's funeral, he decorated Lord Roberts with the Order of the Black Eagle. Earl Roberts received the thanks of both Houses of Parliament and a grant of £100,000 for his services in South Africa. In 1905 he resigned his post on the Committee of National Defence, and devoted himself to attempting to rouse his countrymen to the necessity of cultivating rifle-shooting and of adopting systematic general military training and service. As an author he is known by his Rise of Wellington (1895) and his Forty-One Years in India (1897), an autobiography which has passed through numerous editions.

ROBERTSON, FREDERICK WILLIAM (1816–1853), English divine, known as Robertson of Brighton, was born in London on the 3rd of February 1816. The first five years of his life were passed at Leith Fort, where his father, a captain in the Royal Artillery, was then resident. The military spirit entered into his blood, and throughout life he was characterized by the qualities of the ideal soldier—Cajun soldier. Robertson retired to Beverley, where the boy was educated. At the age of seventeen he spent a year at Tours, from which he returned to Scotland and continued his education at the Edinburgh Academy and university. In 1834 he was articled to a solicitor in Bury St Edmunds, but the ungenial and sedentary employment soon broke down his health. He was anxious for a military career, and his name was placed upon the list of the 3rd Dragoons, then serving in India. For two years he worked hard in preparing for the army, but, by a singular conjunction of circumstances and at the sacrifice of his own natural bent to his father's wish, he matriculated at Brasenose College, Oxford, just two weeks before his commission was put into his hands. Oxford he did not find wholly congenial to his intensely earnest spirit, but he read hard, and, as he afterwards said, “Plato, Aristotle, Butler, Thucydides, Sterne, Jonathan Edwards, passed like the iron atoms of the blood into my mental constitution.” At the same time he made a careful study of the Bible, committing to memory the entire New Testament both in English and in Greek. The Tractarian movement had no attraction for him, although he admired some of its leaders. He was at this time a moderate Calvinist in doctrine, and enthusiastically evangelical. Ordained in July 1840 by the bishop of Winchester, he at once entered on ministerial work in that city, and during his ministry there and under the influence of the missionaries Henry Martyn and David Brainerd, whose lives he studied, he carried devotional asceticism to an injurious length. In less than a year he was compelled to seek relaxation; and going to Switzerland he there met and married Helen, third daughter of Sir George William Denys, Bart. Early in 1842, after a few months' rest, he accepted a curacy and an indifferent living, and the change continued for two years. The questioning spirit was first aroused in him by the disappointing fruit of evangelical doctrine which he found in Cheltenham, as well as by intimacy with men of varied reading. But, if we are to judge from his own statement in a letter from Heidelberg in 1846, the doubts which now actively assailed him had long been latent in his mind. The crisis of his mental conflict had just been passed in Tirol, and he was now beginning to let his creed grow again from the one fixed point which nothing had availed to shift: “The one great certainty to which, in the midst of the darkest doubt, I never ceased to cling—the entire symmetry and loveliness and the unequalled nobleness of the humanity of the Son of Man.” After this mental revolution he felt unable to return to Cheltenham, but after doing duty for two months at St Ebbe's, Oxford, he entered in August 1847 on his famous ministry at Trinity Chapel, Brighton. Here he stepped at once into the foremost rank as a preacher, and his church was thronged with thoughtful men of all classes in society and of all shades of religious belief. His fine appearance, his flexible and sympathetic voice, his manifest sincerity, the perfect lucidity with which he illustrated his points would have attracted hearers even had he had little to say. But he had much to say. He was not, indeed, a scientific theologian; but his insight into the principles of the spiritual life was unrivaled. As his biographer says, thousands found in his sermons “a living source of impulse, a practical direction of thought, a key to many of the problems of theology, and above all a path to spiritual freedom.” His closing years were full of sadness. His sensitive nature was subjected to extreme suffering, arising mainly from the opposition aroused by his sympathy with the revolutionary ideas of the 1848 epoch. Moreover, he was crippled by incipient disease of the brain, which at first inflicted unconquerable lassitude and depression, and latterly agonizing pain. On the 5th of June 1853 he preached for the last time, and on the 15th of August he died.

Robertson's published works include five volumes of sermons, two volumes of expository lectures, on Genesis and on the epistles, and a volume of miscellaneous articles, as well as an Analysis of "In Memoriam." See Life and Letters by Stopford A. Brooke (1865).

ROBERTSON, GEORGE CROOM (1842–1892), Scottish philosopher, was born at Aberdeen on the 10th of March 1842. In 1857 he gained a bursary at Marischal College, and graduated M.A. in 1863, with the highest honours in classics and philosophy. In the same year he won a Ferguson scholarship of £100 a year for two years, which enabled him to pursue his studies outside Scotland. He went first to University
ROBERTSON, J.—ROBERTSON, W.

College, London; at Heidelberg he worked at German; at Berlin he studied psychology, metaphysics and also physiology under du Bois-Reymond, and heard lectures on Hegel, Kant and the history of philosophy, ancient and modern. After two months at Göttingen, he went to Paris in June 1863. In the same year he returned to Aberdeen and helped Alexander Bain with the revision of some of his books. In 1864 he was appointed to help Professor Geddes with his Greek classes, but he gave up the vacations to philosophical work. In 1866 he was appointed professor of philosophy of mind and logic at University College, London. This post he retained until ill-health compelled him to resign a few months before his death in 1892. He lectured on logic, deductive and inductive, systematic psychology and ethical theory. He left little published work. A comprehensive work on Hobbes was never completed, though part of the materials used were for an article in the Encyclopaedia Britannica, and another portion was published as one of Blackwood's "Philosophical Classics." Together with Bain, he edited Grote's Aristotle, and was the editor of Mind from its foundation in 1876 till 1891. He was keenly interested in German philosophy, and took every opportunity of making German works on English writers known in the United Kingdom. In philosophy he followed mainly Mill and Bain, but he was acquainted with all philosophical literature. He was associated with his wife (a daughter of Mr Justice Crompton) in many kinds of social work; he sat on the Committee of the National Society for Women's Suffrage, and was actively associated with its president, John Stuart Mill. He warmly supported the admission of women students to University College.

ROBERTSON, JOSEPH (1810-1866), Scottish antiquary, was born at Aberdeen on the 17th of May 1810, the son of a small shopkeeper. He was educated in Marischal College in Aberdeen and was for some years engaged in literary and newspaper work there and in Glasgow and Edinburgh. In 1839 he helped to found the Spalding Club, organized to publish the historical, genealogical, topographical and literary remains of the north-eastern counties of Scotland, and he edited eight of its thirty-eight volumes. In 1853 he was appointed curator of the historical and antiquarian department of the General Register House, Edinburgh, hitherto a subordinate and unimportant office, but which, in his hands, became of the first consequence to the interests of antiquarian literature in Scotland. His inventory of the personal property and jewels of Mary Queen of Scots, prefixed by a paper of great learning and research, and his essays on Scottish architecture, preceded his greatest work, published by the Bannatyne Club (1866), Concilia Scotiae, Ecclesiae Scoticae Rationes. In 1864 the University of Edinburgh conferred upon him the honorary degree of LL.D. He died on the 13th of December 1866.

ROBERTSON, THOMAS WILLIAM (1829-1871), English actor and dramatist, was born at Newark on the 9th of January 1829. As a dramatist, he had a brief but very brilliant career. The son of a small clergyman, and a younger brother of an actor, that ranged from Bristol to Cambridge, Robertson was familiar with the stage from his childhood; he was the eldest of a large family, the actress Margaret (Madge) Robertson (Mrs Kendal) being the youngest. His success came late. A farcical comedy by him, A Night's Adventure, was produced at the Olympic under Farren's management as early as 1851, but this did not make good his footing, and he remained for some years longer in the provinces, varying his work as an actor with miscellaneous contributions to newspapers. In 1860 he went to London, and edited a mining journal to which he contributed a novel afterwards dramatized with the title Shadow Tree Shaft. He was at one time prompter at the Olympic under the management of Charles Mathews. He wrote a farce entitled A Cantab, which was played at the Strand Theatre in 1861. This brought him a reputation in a Bohemian clique, but so little practical assistance that he thought of abandoning the profession to become a tobacconist. Then, in 1864, came his first marked success, David Garrick, produced at the Haymarket with Edward Sothern in the principal character. It was not, however, till the production of Society at the Prince of Wales Theatre in 1865, under the management of Miss Marie Wilson, afterwards Mrs Bancroft, that the originality and cleverness of the dramatist were fully recognized. Play-writer and company were exactly suited to one another; the plays and the acting together—the small size of the playhouse being also in their favour—were at once recognized as a new thing. Although some critics sneered at the "cup-and-saucer comedy," voted it absurdly realistic, said there was nothing in it but commonplace life represented without a trace of Sheridanian wit and sparkle, all London flocked to the little house in Tottenham Street, and the stage was at once inundated with imitations of the new style of acting and the new kind of play. Robertson, although his health was already undermined, rapidly followed up Society with a series of characteristic plays which made the reputation of himself, the company and the theatre. All his best known plays (except David Garrick) were written for the old Prince of Wales's under the Bancrofts, and that régime is now an historical incident in the progress of the English stage. Ours was produced in 1866, Caste in 1867, Play in 1868, School in 1869, M. P. in 1870. Unhappily, Robertson enjoyed his success for but a short time. He died in London on the 3rd of February 1871. His work is notable for its masterly stagecraft, wholesome and generous humour, bright and unstrained dialogue, and high dramatic sense of human character in its theatrical aspects.

See Principal Dramatic Works of Robertson; with Memoir by his son (1886); and T. E. Pemberton, Life and Writings of Robertson (1893).

ROBERTSON, WILLIAM (1721-1793), Scottish historian, born at Borthwick, Mid Lothian, on the 10th of September 1721, was the eldest son of the Rev. William Robertson. He was educated at the school of Dalkeith and the university of Edinburgh. He was from the first intended for the ministry; in 1743 he was presented to the living of Glasmuir in East Lothian, and two years later he lost both his father and his mother, who died within a few hours of each other. The support and education of a younger brother and six sisters then devolved upon him, though at that time his income was less than £500 a year. Robertson's inclination for study was never allowed to interfere with his duties as a parish minister, and his power as a preacher had made him a local celebrity while still a young man.

His energy and decision of character were brought out vividly by the rebellion of 1745. When Edinburgh seemed in danger of falling into the hands of the rebels he joined the volunteers in the capital. When the city was surrendered he was one of the small band who repaired to Haddington and offered their services to the commander of the royal forces. Such a man could not remain in obscurity, and in 1746 he was elected a member of the General Assembly, where his influence as leader of the "moderate" party was for many years nearly supreme (see ROBERTSON, FREDERICK). During this period of prominent activity in the public life of Edinburgh, Robertson was busy with his historical labours. His History of Scotland, begun in 1753, was published in 1759. Till he had finished his book Robertson had never left his native country; but the publication of his history necessitated a journey to London, and he passed the early months of the year 1758 partly in the capital and partly in leisurely rambles in the counties of England. The success of the History of Scotland was immediate, and within a month a second edition was called for. Before the end of the author's life the book had reached its fourteenth edition; and it soon brought him other rewards than literary fame. In 1759 he was appointed chaplain of Stirling Castle, in 1761 one of His Majesty's chaplains in ordinary, and in 1762 he was chosen principal of the University of Edinburgh. In May 1765 he was elected Moderator of the General Assembly, and in August of the same year the office of King's historiographer was revived, in his favour with a salary of £200 a year.

The rest of Robertson's life was uneventful. His History of...
the Reign of the Emperor Charles the Fifth occupied ten consecutive years of labour. It appeared in three volumes quarto in 1769. In 1777 he published his History of America and in 1791 his Disquisition concerning the Knowledge which the Ancients had of India, which concluded his historical labours and appeared only two years before his death, which occurred near Edinburgh on the 11th of June 1793. His fame had long been European, and he left no rival in the field of historical composition save Gibbon alone.

For an adequate appreciation of Robertson's position in British literature, and more especially of his rank as an historian, we have to consider the country and the age in which he was born and his own personal qualities and limits. Considering the small size and poverty of the country, Scotland had made a more than creditable figure in literature in the great age of the Reformation and the Renaissance, and Scottish contributions to British literature in the last half of the 18th century were distinctly superior to those produced in the southern portion of the island.

Of the three great British historians of the 18th century two were Scotsmen. The exact place of Robertson with regard to his two friends Hume and Gibbon, and to such historians as the rest of Europe had to offer, presents a question of some nicety, because it is confused by literary combinations, so to speak, which should not weigh in an abstract estimate, but cannot be excluded in a concrete and practical one. If we regard only Robertson's potential historic power, the question is not so much whether he was equal to either of his two friends as whether he was not superior to both. The man who wrote the review of the state of Europe prefixed to the History of Charles V., or even the first book of the History of Scotland, showed that he had a wider and more synthetic conception of history than either the author of the Decline and Fall or the author of the History of England. These two portions of Robertson's work, with all their shortcomings in the eye of modern criticism, have a distinctive value which time cannot take away. He was one of the first to see the importance of general ideas in history. He saw that the immediate narrative of events with which he was occupied needed a background of broad and connected generalizations, referring to the social state of which the detailed history formed a part. But he did more than this. In the appendix to the view of Europe called "Proofs and Illustrations" he enters into the difficult and obscure question of land tenure in Frankish times, and of the origin of the feudal system, with a ruggedness and a vigour which distinctly advanced the comprehension of this period beyond the point at which it had been left by Du Bos, Montesquieu and Mably. He was well acquainted with the original documents,—many of them, we may conjecture, not easy to procure in Scotland. It must have been a genuine aptitude for historical research of a scientific kind which led Robertson to undertake the labour of these austere disquisitions of which there were not many in his day who saw the importance. Gibbon, so superior to him for wide reading and scholarship, has pointedly avoided them. Robertson's views are now out of date. But he deserves the honour of a pioneer in one of the most obscure if also important lines of inquiry connected with European history. On the other hand, it must be admitted that he showed himself only too tame a follower of Voltaire in his general appreciation of the middle ages, which he regarded with mingled ignorance and prejudice common in the 18th century. In this particular he was not at all in advance of his age.

The neglect and gradual oblivion which have overtaken the greater part of Robertson's historical work are owing to no fault of his. He had not and could not have the requisite materials; they were not published or accessible. Just as it requires that we should estimate his performance in view of the means at his command, and few critics would hesitate to subscribe to the verdict of Buckle, "that what he effected with his materials was wonderful." His style is singularly clear, harmonious and persuasive. The most serious reproach made against it is that it is correct to a fault and lacks idiomatic vigour, and the charge is not without foundation. But there can be no doubt that, if Robertson's writings are less read than they formerly were, the fact is to be attributed to no defects of style but to the growth of knowledge and to the immense extension of historical research which has inevitably superseded his initiatory and meritorious labours.

By his wife, Mary Nisbet, whom he married in 1751, Robertson left three sons: William (1753-1832), who in 1805 was raised to the Scottish bench as Lord Robertson; James, who became a general in the British army; and David, who in 1790 married Margaret, sister of Colonel Donald Macdonald and heiress of Kinloch-Moidart, whose surname he assumed.

There are lives of Robertson by Dugald Stewart (Edinburgh, 1801 and 1802), prefixed to most of the collective editions of his works; by George Gleig, bishop of Brechin (Edinburgh, 1812); and by Benjamin Hill in Notes of Men of Letters, &c. (1845-1846).

ROBERTSON, WILLIAM BRUCE (1820-1886), Scottish divine, was born at Knockhill, St. Ninians, Stirlingshire, on the 24th of May 1820, and was educated at Glasgow University and at the Secession Theological Hall, Edinburgh, where he made the acquaintance of Thomas de Quincey, and on his recommendation went to Halle and studied under Tholuck. After travelling in Italy and Switzerland he was licensed to preach by the presbytery of Stirling and Falkirk in 1843, and was soon after ordained at the Secession (after 1847, the United Presbyterian) Church in Irvine, Ayrshire. In this charge he remained for 35 years, exercising from his pulpit a truly magnetic influence, not so discernible in his published sermons. From 1871 his health failed, in spite of several visits to Florence and the Riviera. He resigned his charge in 1878 and died at Bridge of Allan on the 27th of June 1886.

He wrote many hymns, among them a version of "Dies Irae"; several of them, together with letters, &c., are to be found in the Collected Letters of James Brown. A volume containing Robertson's lectures on Martin Luther and other subjects was published in 1892.

ROBEWAL, GILLES PERSONNE (or PERSONIER) DE (1602-1675), French mathematician, was born at Roberval, near Beauvais, on the 8th of August 1602. His name was originally Gilles Personne, that of Roberval, by which he is known, being taken from the place of his birth. Like René Descartes, he was present at the siege of La Rochelle in 1627. In the same year he went to Paris, where he was appointed to the chair of philosophy in the Gervais College in 1631, and two years later to the chair of mathematics in the Royal College of France. A condition of tenure attached to this chair was that the holder should propose mathematical questions for solution, and should resign in favour of any person who solved them better than himself; but, notwithstanding this, Roberval was able to keep the chair till his death, which occurred at Paris on the 27th of October 1675.

Roberval was one of those mathematicians who, just before the invention of the infinitesimal calculus, occupied their attention with problems which are only soluble, or can be most easily solved, by some method involving limits or infinitesimals, and in the solution of which accordingly the calculus is always now employed. He had, indeed, some time before the era of Cavalieri, made his geometry of axes and the curvature of solids, which he accomplished, in some of the simpler cases, by an original method which he called the "Method of Indivisibles"; but he lost much of the credit of the discovery as he did not use his method for his own purposes. Cavalieri published a similar method which he himself had invented. But the method of Roberval's discoveries was a very general method of drawing tangents, by considering a curve as described by a moving point whose motion is the resultant of several simpler motions. (See INFINITESIMAL CALCULUS.) He also described a method of deriving one curve from another, by means of which finite areas can be obtained equal to the areas between certain curves and their asymptotes. To these curves, which were also applied to effect some quadratures, Evagelista Torricelli called "Descartes' lines." Between Roberval and Descartes there existed a feeling of ill-will, owing to the jealousy aroused in the mind of the former by the criticism which Descartes offered to some of the methods employed by him and by Pierre de Fermat; and this led him to criticize and oppose the analytical methods which Descartes introduced into geometry about this time. As results of Roberval's labours outside the department of pure mathematics may be noted a work on the system of the universe, in which he supports the Copernican system and attributes a mutual attraction to all particles of matter;
ROBES

ROBES (Fr. robe, Late Lat. roba, rœpe, meaning (1) spolias, (2) robe, stuff, cf. Mod. Ital. roba, connected with a Teutonic root raup, rœul, German rœben and English robe), the name generally given to a class of official costume, especially as worn by certain persons or classes on occasions of particular solemnity. According to Du Cange, the word robe was earliest used, in the sense of a garment, of those given by popes and princes to the members of their household or their great officers. Thus, Matthew Paris (Chron. Majora, Rolls Series, V. 58) tells how, in 1248, the pope gave to some Tartar envoys "vestes pretiosissimas quas Robas vulgariter appellamus, de escarleto praecelato, cum pellibus et furrius," with which Du Cange compares the "festiva indumenta" given, e.g., by King John magnatum suorum multitudini at Christmas time (1214, Matt. Paris, Rolls Series, II. 520) and the rœbœs pœpœs scutulœorum, and the like, given by the popes to members of their households, after the fashion of a livery. It would, however, be perhaps going too far to assume that, e.g., peers' robes were originally the king's livery, for there seems to be no proof that this was the case; but it is curious that in most early cases where robes are mentioned, if not of cloth of gold, &c., they are of scarlet, furred. A robe is properly a long garment, and the term "robes" is now applied only in those cases where a long garment forms part of the official costume, though in ordinary usage it is taken to include all the other articles of dress proper to the costume in question. The term "robes," moreover, connotes a certain degree of dignity or honour in the wearer. We speak of the king's robes of state, of peers' robes, of the robes of the clergy, of academic robes, judicial robes, municipal or civic robes; we should not speak of the robes of a cathedral verger, though he too wears a long gown of ceremony, and it is even by somewhat stretching the term "robes" that we can include under it the ordinary academic dress of the universities. In the case of the official costume of the clergy, too, a distinction must be drawn. The vestimenta sacra are not spoken of as "robes"; a priest is not "robed" but "vested" for Mass; yet the rochet and chimere of an English bishop, even in church, are more properly referred to as robes than as vestments, and while the cope he wears in church is a vestment rather than a robe, the scarlet cope which is part of his parliamentary full dress is a robe, not a vestment. For the sake of convenience the official, non-liturgical costume of the clergy is dealt with under the general heading Vestments and the subsidiary articles (e.g. Cope).

The parliamentary robes of emperors and kings, representing as they do the sacerdotal significance of Christian kingship, are essentially vestments rather than robes (see Coronations). Apart from these, however, are the royal robes of state; in the case of the king of England a crimson velvet surcoat and long mantle, fastened in front of the neck, ermine lined, with a deep cape or tippet of ermine.1

The subject of official robes is too vast for any attempt to be made to deal with it comprehensively here. All countries, East and West, which boast an ancient civilization have retained them in greater or less degree, and the tendency in modern times has been to multiply rather than to diminish their number. Even in republican France they survived the Revolution, at least in the universities and the law courts. But nowhere has custom been so conservative in this respect as in the United Kingdom, where in this as in other matters the wise Machiavellian principle has been followed of changing the substance of institutions without altering their outward semblance. The present article, then, does not attempt to deal with any but British robes,2 under the headings of (1) peers' robes; (2) robes in the House of Commons; (3) robes of the Orders of Knighthood; (4) judicial and forensic robes; (5) municipal and civic robes; (6) academic costume.

Peers' Robes.—As early as the end of the 14th century peers seem to have worn at their creation some kind of robe of honour; this we may conclude from the description of the investiture of the earl of Somerset in 1397 (Rot. Parl. iii. 343), which says: "le dit Monsieur John fut amenée devant le Roy en Parlement entre deux Contes, c’est assavoir Huntyngodon et Mareschall, vestuz en un pane (Du Cange; ponsus = 3. habitus vestimentum) come vesture de honor;" while in accounts of various creations of about the same time (Rot. Parl. iii. 205, 206) are used the words "advenienteque . . .prefato Duce honorifice . . . togato et ornato." An early illustration of their use is to be found in an illumination on the foundation charter of King's College, Cambridge (see fig. 1), which represents the peers as

early as 1446 wearing gowns, mantles and hoods of scarlet, furred with miniver, the mantle opening on the right shoulder and guarded with two, three or four bars of miniver, in the form of short stripes high up on the shoulder. The origin of these is as yet unknown, and it is not certain precisely when the peers' velvet robe of estate was first used. At the coronation of Henry VI. the king's own parliament robe was of scarlet and miniver (Gregory's Chronicle, ed. Gairdner, Camden Soc. pp. 155-70), so the peers' robes were certainly not yet of velvet; at that of Henry VII. (see Rutland Papers, 1842; "Device for the Coronation of Henry VII.") the king had a robe of crimson velvet and ermine, but the "lords temporal" are only said to have been in their robes; at that of Henry VIII. (see Hall's Chronicle) the king in his progress through the city wore a crimson velvet robe furred with ermine, "his knights and esquires for his body" wore crimson velvet, and "all the gentlemen," &c., scarlet, while we hear of the "lords spiritual and temporal, and of their costly and rich apparel, of several devises and fashions," and notably of the duke of Buckingham's robe of gold and needlework (Stow's Annals, p. 813), which would show that the velvet robe of estate was not yet worn at the king's coronation. The duke of Richmond at his creation in 1525 (17 Henry VIII., see Brewer, State Papers, iv. 659) is described as clad in robes of estate, and the description of the investiture says that "the patent was read, the robe, sword, cap and circlet put on," and about this time references are found to the "parlament robes" of peers, implying that there were others.

An account of the coronation of Anne Boleyn in 1533, in J. Nichols, Progresses of Queen Elizabeth, vol. i. p. 1, says that in her progress through the city "all the lords for the most part were clothed in crimson velvet," while at

1 For the sovereign's coronation robes, see "The King's Coronation Ornaments," by W. St John Hope, in The Ancestor, vol. i. and ii., also L. Wickham Legg, English Coronation Records, 1901. The "parliamentary robes" used to be of crimson or purple velvet, furred with ermine. See the above, also the inventories of the wardrobe of sovereigns, &c.

2 In the United States few save Federal judges wear robes. The scarlet judicial robes were discarded at the Revolution. Those of black silk now worn are slightly modified academic gowns. John Jay, first Chief Justice of the Supreme Court (1787), set the fashion by sitting in the L.L.D. gown granted him by Columbia University.

Baron in Parliament Robes

Robes lent by Edw. Son & Ravenscroft Chancery Lane, London
Westminster the barons and viscounts wore their parliament robes, the earls, marquesses and dukes wearing their robes of estate of crimson velvet "furred with ermines, poudred according to their degrees." This was also the case at the coronation of James I., and in Selden's Titles of Honour (ed. 1672) the illustrations show the baron and viscount in parliamentary robes, the higher ranks in robes of estate. By the time of James II.'s coronation, however, the baron and viscount had the velvet robes of estate (see illustration on p. 188 of Perkins's The Coronation Book, 1902, where the surcoat also appears to have a pointed collar edged with white and to be sleeveless). The colour of these seems to have been crimson at first, sometimes varying to purple. They consisted of a long gown or surcoat with a mantle lined with ermine, a hood and a tippet of ermine, the rows being as follows: for a duke, a marquess 3½, an earl 3, a viscount 2½, and a baron 2.2

Till late in the 18th century peers continued to attend the House of Lords in parliamentary robes, with the stars and ribbons of their orders, but robes are now only worn in the House of Lords, e.g., at the opening of parliament, on occasions when the sovereign gives the assent to bills by "royal commission" (when five or six peers on the government side appear in robes, and the lord chancellor also wears his peer's robe of scarlet ermine), and at the introduction of a newly created peer, when the new peer and his two introducers wear their parliamentary robes (over morning dress) during the ceremony of introduction only. The mover and seconder of the Address no longer wear robes, but uniform. On all the above occasions, and when the peers as a body attend church or some other ceremony, the parliamentary robe of scarlet cloth is worn; in the present day it takes the form of a mantle opening on the right shoulder, with a collar of "ermines," and guarded with rows of ermine and gold lace round the right shoulder, varying in number according to the rank of the wearer. The modern coronation robes consist of a crimson velvet surcoat and a mantle with a tippet of ermine and with rows of ermine as in the parliamentary robes. The surcoat is no longer a gown, but a short sleeveless garment.

For Scotland, an order of James II. (1455) prescribed for earls "mantes of brown granick colour" open before, lined and faced in front, as far as the girdle, with white fur, and with hoods to match; for the other lords of parliament a red mantle lined with silk or fur, with a furred hood, while James I. (and VI.) in 1606 had granted the peers of Scotland, besides white silk or velvet surcoats, the privilege of wearing crimson velvet robes in parliament, and confining them to those of scarlet cloth (Miscellany of the Maitland Club, vol. i. p. 147). The robes of the Scottish peers are now, of course, similar to those of the others.

The introduction of Anne Boleyn are also described in the account mentioned above. The duchess of Norfolk, the train-bearer, was followed by "ladies being lord's wives" in scarlet robes furred with "lettice," while Wriothesley (loc. cit.) adds that the duchess was also in scarlet.3 The order of the earls and barons for the regulation of the peeresses' robes, made by the order of James II. (given in J. H. T. Perkin's The Coronation Book, 1902, pp. 202-5) shows that by then all peeresses wore the robes of state of crimson velvet, and minutely regulates all details, such as shape, proportions, and other parts of the dress, down to the embroidery of the mantle. They have changed very little up to the present day.

Robes of the Orders of Knighthood.—The history of the robes of the two oldest orders is given in great detail in Ashmole's Order of the Garter (London, 1672) and Astin's Order of the Bath (London, 1725); see also G. F. Beltz, Memorials of the Order of the Garter (London, 1841). p. l.iii. In each case the robes consisted of a mantle, surcoat and hood. The robes of the Garter were originally of blue woolen stuff, the surcoat and hood being powdered with garters embroidered in silk and gold. In the time of Henry VI. the mantle was first made of velvet, and between the time of Elizabeth and of Charles I. it seems to have been sometimes purple in colour. The surcoat varied in colour from year to year; in the reign of the founder alone, e.g., it was first blue, then black (possibly as a sign of mourning for the plague), then "sanguine in grain." The hood was made of the same material as the surcoat, and when hats began to be worn, was carried hanging over the shoulder. The number of garters embroidered on the surcoat and hood came to be fixed by rank, but after Henry VI. the surcoat seems to have been made of plain velvet. Robes were sometimes granted to ladies in the early days (see Beltz, p. cxxxi., for a list of those ladies), in which case the robe and hood were of the colour of the surcoat worn by the knights that year, and powdered with garters. The last lady to receive the robes was Margaret, countess of Richmond, in 1488. At the present day the mantle is of dark blue velvet, of the same colour as the ribbon, lined with fur, and with the star embroidered on the left shoulder, the hood and surcoat are made of white taffeta, and with these are worn a doublet and trunk-hose of white satin and a plumed hat (see Lawrence-Archer, The Orders of Chivalry, p. 106).

The robes worn by the knights of the Bath created at the coronation of Henry IV. were green with furred hoods, and a white silk cord hanging from the left shoulder.4 In the various accounts of later creations of knights of the Bath quoted by Anstis, the costume worn before the ceremonial bath seems to have been a priest-like garment of russet or grey, with a girdle and hood; after the bath, was put on a red surcoat and mantle, the latter with a lace of white silk, from which hung a pair of white gloves; and the final costume was a blue (later a purple) velvet or satin gown, with hood furred with miniver (later lined with sable), and the white cord hanging from the shoulder, until it should be removed by the sovereign or a lady for some deed of valour. The mantle in the present day is of crimson velvet lined with white over a white satin under-coat and trunk-hose, and a plumed hat and white boots with red tops are worn. The mantle of the Thistle is of dark green velvet over surcoat, &c., of cloth of silver; that of St Patrick azure, with doublet and trunk-hose of white satin; that of St Michael and St George of Saxony blue satin lined with scarlet; and that of the Star of India of light blue satin lined with white.

House of Commons.—The speaker of the House of Commons wears on state occasions a black damask robe with gold lace and a full-bottomed wig; in the House itself he wears a black silk robe with train and a full-bottomed wig. The clerks at the table wear barristers' gowns and wigs.

Judicial and Forensic Robes.—It is frequently stated that judicial robes had their origin in the dress of ecclesiastics. But though ecclesiastics in early days frequently acted as judges, and though, as Fortescue says, the serjeant's long robe was "ad instar sacerdotis," judicial robes more probably arose from the ordinary civilian dress of the early 14th century. The chief argument for the ecclesiastical origin has been found in the cœla (tensa, birretum albus) a cap of white linen or silk, tied under the chin, and worn by ecclesiastics. The gradual adoption of it by the principal or chief insigniment and habit wherewith serjeants-in-law at their creation are decked," which is said to have been used by ecclesiastics to hide the tonsure when in court. This view is disposed of by Pulling (The Order of the Coif, London, 1884). More probably the coif was a head-dress in common use in the 13th century, which survived as the distinguishing mark of men of law.4 As such it is found in a wardrobe-roll of 8

8 Longues cottes vertes a estreicotes manches fourres de menever, et chappepons pareil foreures de menever, en guise de prelets, et avoient les dits chevaliers sur la senestre espale un doubble cordeau de soye blanche a blanche houppeurs pendans "(Froissart).
9 Mr Oswald Barron, in The Ancestor, vols. v. (p. 105) and vii. (p. 108 sqq., plate xii.), has given reproductions of figures from MSS.
ROBES

Richard II. (1391, see Fairholt, ii. 347) in an entry for “twenty-one linen cloaks forcounterfeiting of men in the king's play at Christmas.” The servant-at-law's “boune of silk” is also mentioned in Fiers the Pleasman (latter half of the 14th century). With his ferron cap he was dressed and girdled. The earliest document quoted by Planche and others with reference to judges' costume is a Close-rol of 20 Edw. III. (1347). See also a wardrobe-roll of 21 Edw. III., and wardrobe accounts of Richard II. and Henry VI., all quoted in Dugdale's Origines Juridicales, from which it appears that the orange was varied in colour, in the 14th and 15th centuries, from scarlet to green or “violet in grain,” and that their winter gowns were furred with mink or minare

For the early 15th century there is more data. Firstly, there is the illumination of the servant-at-law in the Ellesmere MS. of The Canterbury Tales (reproduced in Furnivall's 6th edition for the Chaucer Society), in which he is shown wearing a short, party-coloured rayed gown of red and blue, lined with white fur, a hood and tippet edged with white fur, and with wide bands forming below the hood. Secondly, there are a certain number of effigies or brasses of judges and servantes belonging to the first half of the 15th century. Of these, that of Sir John Casy (c. 1400) (see fig. 2).

For the second half of the 15th century the authority is Chief-Justice Fortescue, who, writing in 1477, says (p. 417):—

'This is whereunto is the dress of the servant-at-law as follows:

"Roba longa ad instar sacerdotis cum capicio penultato circa humeros ejus, et desuper collo, cum capicio, quod est unum solumm doctores legum in universitatis quibusdam, cum supra descripsit biretum vestiatur." He was clothed in a long robe, after the fashion of a priest, with a ferron cap about his head, and a hood, with two bands, such as are used by doctors of laws in some universities, with the coat as described above (De Laudibus Legum Angliae, p. 175). Fortescue also remarks:—

'The effigy of this judge is shown wearing party-coloured gown, as a servant-at-law, and his cap is fringed with minare, whereas the servant-at-law's is fringed with white lamb (budge).'

This description is based on effigies, and illuminations from a 15th-century MS. representing sittings of the four superior courts in the time of Henry VI. (reproduced in Archaeologia, vol. xxxix. p. 358, &c., with an article by G. R. Corner; see plate). In them we see the scarlet robes of the judges fringed with minare, and the party-coloured rayed gowns, tippets and hoods of the servantes, and the costumes of the minor officials of the court. Both servants and judges wear the coif, certain of the judges also wearing furrowed caps or turban-like head-dresses. The colour of the servants' party-coloured robes seems to have varied; in these illuminations they are of red and blue or green, and in the 17th century, to quote Dugdale's Origines Juridicales, cap. 38: “The robes they now use do still somewhat resemble those of the justices of either bench, and are of three distinct colours, viz. murrey, black, fringed with white, and scarlet; but the robe which they usually wear at their creation is a murrey, murrey and mouse colour; whereas unto they have a hood suitable, as also a coif of white silk or linnen.” (See also Pulling, p. 218, and Druitt, p. 225.) Sir E. Brabrook (Proceedings of the Soc. of Antiquaries, 2nd series, vol. iii. p. 414) states that in 1578 and 1584 the servantes wore party-coloured gowns at their creation and during the year following, and stating on what occasions they wore their black, scarlet or purple gowns (the last with scarlet or purple hoods). The last general cap (1729) and at the creation of a servant-at-law in 1762, party-coloured robes were still worn, but at a creation of 1809 they are no longer found. Until their final abolition the servants wore purple robes at their creation, and on occasion a black, or red or silk gown, with a scarlet robe for state occasions.

Illustrations of judicial costumes in the 16th century are to be found in vol. i. of Vetusta Monumenta (Soc. of Antiquaries 1574), in which are reproduced, firstly, a painted table in the King's Exchequer, temp. Henry VII., on which the officers of the Exchequer are shown wearing long gowns, fringed tippets and mantles, with coats (see also Pulling, p. 218). The table of the Court of Wards and Livery, temp. Elizabeth, in which are shown servants wearing party-coloured gowns, tippets, hoods and coifs (see also Pulling, facing pp. 86 and 214).

About this time the square cap (formerly known as the cornered, black or sentence cap) (the last from the fact of its being put on by the judge when pronouncing sentence of death), was worn by judges in the robe. It is also worn by judges in the robe of the Court of Coke. It has no ear-flaps, sometimes, as in its present form, it has. The form with ear-flaps is held by some to be a combination of the square cap and skull-cap. The square cap was a mark of dignity, worn or carried on solemn occasions, hence its use when pronouncing sentence of death, to mark the solemnity of the moment.

Among the State Papers of 1625 is a "Discourse on what robes and apparel the judges are to wear, and how the servants-at-law are to wear their robes, and when." On the 4th of July 1635 it is said: "the judges are to wear their robes and mantles and capes, and are to have certain rules made by all the judges of the courts at Westminster," which is quoted in Dugdale (loc. cit.) and Pulling (p. 215, footnote).

This costume is illustrated in Haller's engraving of the coronation procession of Charles II. Towards the end of the 17th century the judges took to wearing wigs, and have continued to wear them ever since. The wearing of wigs naturally concealed the coif and velvet skull-cap, so a device had to be invented by which they could still be seen, and a headpiece was invented, consisting of a round patch of white stuff, with a black spot in the middle of it, and the crown of the wig of certain of the judges, to represent the skull-cap. The servant-at-law no longer existing, this round patch has now disappeared, the only trace of it left being the circular depression on the crown of the wig.

The costume of judges of the High Court at the present day differs very little from that given in the order of 1635; but the cap is carried in the hand as a part of the full dress, and only worn when a judge is passing sentence of death. The 6 They were probably originally liveries; see G. R. Corner in Archaeologia, also Pulling, op. cit. p. 211-12.

6 See an essay in Unwritten Laws and Identified, ed. E. H. Perring (Smith, Elder, 1899), from which the following paragraph is largely condensed.
One of four illuminations belonging to a law treatise, *temp. Henry VI*, found at Whaddon Hall, Bucks, depicting five presiding judges of the Court of King's Bench, wearing coifs and scarlet robes; below the King's Coroner, Attorney and Masters of the Court; two ushers at table swearing the jury; a tipstaff in charge of a fettered prisoner, two sergeants at law in coif on either side; in foreground six prisoners.

and the hood lined. The Lord Justice Clerk wears a scarlet cloth robe and hood, and a white silk tippet lined with scarlet, the silk being perforated with small holes to imitate ermine, as also on the sleeves and edges of the gown. In front of the tippet on each side are two crosses in scarlet silk, and on each side of the gown six crosses. The ordinary Lords Commissioners of Judicature have robes the same as those of the Lord Justice Clerk, except that the satin is not perforated. Instead of the bands worn by English judges, the Scottish judges wear a long fall in front.

The Bar.—There appears to have been no official costume for the bar until the end of the 17th century. Druit (Costume in Braasses, pp. 232-33) gives a list of several brasses of *in lege peri* or *apprentici ad legem*, most of whom wear ordinary civilian costume, occasionally with the addition of a high cap. In the 16th and 17th centuries they wear the false-sleeved gown worn by civilians. Before the 17th century the costume worn by students at the Inns of Court and by "Utter Barristers" consisted of a stuff gown, and sometimes, in term-time, a round cap, which was worn in hall and in church (see Herbert, *History of the Inns of Court* (1804), p. 230). In Westminster Hall (see Pulling, p. 125) the same costume was worn, Benchers and Readers having to add an elaborate gown with facings of black velvet and tufts of silk. Frequent laws were passed in the 16th century and later, forbidding the wearing of swords, cloaks, boots and spurs, &c., in hall, and insisting on the wearing of gowns by students of the Inns of Court when walking in the city. In the 17th century, barristers, like the judges, adopted wigs, the full-bottomed wigs being confined to judges, "King's Counsellors," &c., and ordinary counsellors wearing small wigs. In Hollar's engraving of the coronation of Charles II. the King's Counsel, the King's Attorney and Solicitor, and the Master of the Rolls wear a laced gown with hanging sleeves. The silk gown, full-bottomed wig and black court dress now worn by King's Counsel is generally held to date from the funeral of Queen Mary II., being the mourning dress worn by the wish of King William for a considerable period after the queen's death, and adopted as a convenient costume ever since. There is a well-known jest of Chief Baron Pollock to the effect that "the Bar went into mourning at the death of Queen Anne, and never came out again," which bears out this theory as to the origin of the costume. At the present time barristers wear black stuff gowns, with small wigs having three rows of curls round the head. King's Counsel wear black silk gowns over a cloth court suit (ep. the expression "to take silk," i.e. to become a K.C.); on full-dress occasions they wear a full-bottomed wig, and at court a black damask tufted gown over a velvet court suit. This is also the dress for state occasions of the Attorney-General, Solicitor-General, &c.

Municipal and Civic Robes.—The word "livery," the use of which is now practically confined to the costume of the "livery companies," the dress of men-servants, &c., originally meant an allowance of food or clothing granted to certain persons (Lat. *liberata, Fr. livrée*). It is still used of the allowances of food made to the fellows of certain colleges. As early as the 13th century, according to Matt. Paris (Chron. Maj.; *Rolls Series*, III. 337), we find the citizens of London assuming a uniform dress to do honour to some great occasion, as, e.g., when in 1236 a body of them rode out to meet Henry III. and Queen Eleanor, "sericis vestimentis ornati, cicladibus auretis texturis, exagotatis mutatoris amicti," or when 600 citizens rode out to meet Queen Margaret, wife of Edward I., "in one livery of red and white, with the cognizances of their mistresses embroidered upon their sleeves" (see Stow's *Sarrey*, ed. Morley, p. 442). By the 14th century there is evidence of the adoption of liveries by the trades and fraternities. At the celebrations of the birth of Edward III. (see Riley's *Memorials*, p. 105) the mayor and aldermen were "richly arrayed in suits of robes," while the drapers, mercers and vintners were also in "costume." This need not, however, refer to liveries. G. Unwin (The *Gilds of London*, 1908) quotes a chronicler who records that by the year 1310 "many of the people

---

1. Minute details of court and levee dress, judicial and legal, will be found in *Dress worn at Court* (pp. 60-61), issued with the authority of the Lord Chamberlain, and ed. H. A. P. Trendell, of the Lord Chamberlain's department (London, 1908).—also details of mourning costume.
of the trades of London were arrayed in livery, and an ordinance of 1347 of the fraternity of the Mercers commanding that "all those of the said mistery shall be clothed of one suit once a year at the feast of Easter," and Riley (op. cit. p. 576) gives an order of 1389 allowing the sheriffs, on grounds of expense, to proceed to Westminster by boat instead of on horseback, "without there being any arraying of men of the trades in like suit for that purpose; except that such men of the trades as should wish to accompany them should walk in such suit of vestments of the livery of their respective trade as they might then have." As to the liveries of the religious fraternities, Chaucer (Prologue 361) describes——

"An Haberdasher and a Carpenter
A Webbe, a Dyre, and a Tapicer,
As, "cloathed alle in a livery
Of a solemn and great fraternitee.

In 1389 there was a petition against the giving of liveries by the fraternities, on the ground that these gatherings were centres of political agitation, but in the statutes of Edward III. and Richard II. against liveries members of guilds were expressly excepted from these prohibitions. However, it was doubtless deemed prudent to make sure of the privilege, and so, when the livery companies were incorporated, they took care to have their liveries authorized by their charters.

These liveries consisted of a gown and hood, though the hood only was sometimes given; thus the Grocers' Company had in 1430 55 members in the full livery 17 in hoods and 42 not in livery. It was also customary for such of the companies as wished it to present liveries to outsiders, for instance, to the mayor, should he belong to another company. Thus in 1390 the Tailors gave liveries to the king, the prince and the mayor, and hoods to the sheriffs. But in 1413 and 1423 the mayor and aldermen were forbidden to receive any livery except that of their own company. A similar custom was that by which a member of any company might send to the mayor a certain sum, receiving in return a suit of the livery of the mayor's company. The colours of the various liveries varied very much from time to time. Thus in 1414 the Grocers wore liveries of scarlet and green, which were changed in 1418 to scarlet and black, in 1428 to scarlet and blue and in 1430 to "violet in grain," with party-coloured hoods of violet and crimson. At first both gowns and hoods were party-coloured, but later a party-coloured hood was worn with a gown of one colour. The gowns were also lined and edged with fur. An early illustration of the liveries is to be found on the first charter of the Leathersellers' Company, granted to Henry VI. in 1444 by William Black's History and Antiquities of the Leathersellers' Co.

In the reign of Henry VIII., Holbein's picture of the king giving a charter to the Barber-Surgeons' Company shows the members of the latter wearing gowns of rich stuff, with red and black party-coloured hoods, three of the figures also in cloaks. The form of gown which has survived, practically unchanged, till the present day; may be seen on the second charter of the Leathersellers' Company, granted to them by James I. in 1604 (see fig. 5, and for coloured plate see W. H. Black, op. cit.). Here we see them in flat caps, long black furred gowns, with false sleeves, and having on the right shoulder party-coloured hoods of scarlet and black, the end of which is cast over the left shoulder and hangs down nearly to the edge of the gown.

Besides the liveries of the city companies, and those of the mayor and sheriffs, there was often a special livery adopted by all the citizens on some great occasion, such as a visit of the sovereign to the city. Thus in 1441 W. St John Hope (Corporation Plate and Insignia, ii. 141) quotes a charter of such a livery as one of the courtiers are to ride to Westminster in the mayor's procession, "arrayed in a cloak and hood at least, that are party-coloured, as scarlet and white, or red and white, the red on the right side," while he quotes (from Letter-Book H. fol. cxxxv) the amusing sentence passed by his fellow-aldermen in 1382 on John Seley, for disregarding the order to have his green cloak for the Whitsuntide procession ("We would have you arrayed there in green and with green taffeta. Thus before the 15th century the aldermen apparently had not yet their scarlet robes, but on state occasions wore the ordinary city livery. For the early 15th century we have the Liber Albis (written c. 1410; Rolls Series, ed. Roby), in which we are told (p. 36) that "The Mayor, Sheriff and Aldermen were wont to array themselves in like suits of robes twice in the year, viz., when the mayor rode to Westminster to take the oath, and on the day following the feast of SS. Simon and Jude; and this riment was trimmed with fur as befitting their nobleable rank; and they would also dress themselves in a suit of robes against the feast of Pentecost, these robes having a lining of silk." The scarlet, violet and black robes, still worn by the Lord Mayor, aldermen, &c., were early in use. There is an order of 1421 (6 Henry VI.) that the aldermen should use "togs et armillias de scarleto," and in numerous accounts of royal receptions and other solemn occasions in the City we are told that the mayor and aldermen were in scarlet (W. St John Hope, in Corporation Plate and Insignia, ii. 141). The order of 1414 (3 Henry VI.) to Kingston-on-Hull in 1440 contains practically the same words (see St J. Hope, i. lxxxvi).

The costume of provincial mayors and aldermen there is evidence that at quite an early date many of them followed the fashion of London; e.g. the Royal Charter of Nottingham, of 1448, contains the words: "The Mayor and Aldermen of the same town forever shall use gowns, hoods and cloaks of one suit and one livery together with furs and linings suitable to these cloaks, in the same manner and form as the Mayor and Aldermen of our City of London do use, the Statutes of Liveries . . . notwithstanding." (see Nottingham Records, ii. 205), while in a letter granted by Henry VI. to Kingston-on-Hull in 1440, we can see from brasses of lord mayors and aldermen (see Haines, Manual, pp. cc-cc; and Cotman, Norfolk Brasses. There is a fine series of brasses of mayors, &c., at Norwich) that it consisted of a long gown, a mantle fastened on the right shoulder with a scarf.

There is a fine series of brasses of mayors, &c., at Norwich) that it consisted of a long gown, a mantle fastened on the right shoulder with a scarf.

There is some doubt as to when the Lord Mayor first began to wear his robe of estate of crimson velvet. Stow (Survey, ed Strype, 1720, ii. 165) says that at the reception of Henry VI. at Eltham the Lord Mayor is represented in crimson robes, and that the aldermen is scarlet with a "sanguine" colour, but at the coronation of Edward V. (see St J. Hope) he wore scarlet. At the coronation of Anne Boleyn (see Wriothesley's Chronicle, loc. cit. supra, and Hall's Chronicle) the mayor wore his crimson velvet robe of state; and at the entry of Anne of Cleves into London the mayor was again in his crimson velvet robe with his collar of gold, the aldermen and councilmen in robes of black velvet with chains of gold (but see

The Lord High Chancellor of England, in robes of State.

Lord Mayor of London, in full robes.

Judge of the High Court, England, in black robes.

Alderman of the City of London, in bench robes.
Lord Chief Justice of England in full robes, scarlet and ermine, with collar of S. S.

Judge of the Supreme Court of the United States of America.

The Lord High Chancellor of England, in robes of State.

Lord Mayor of London, in full robes.

Alderman of the City of London, in bench robes.
ROBES

St. J. Hope, i. 144, who quotes the order for these same robes, from which it would appear that the mayor also wore black velvet.

About this period begin to occur notices of the wearing of official robes by the wives of mayors and aldermen; e.g. for Lincoln there is a record (p. xlvi.) of the purchase of two velvet gowns for the mayor's wife, which had not been mayor to prepare for himself and his wife gowns of crimson, and every one that hath been mayor to prepare for himself and his wife gowns of scarlet and tippets of velvet to be worn at all public ceremonies. In 1614, the Lord Mayor of London, Sir John Hope (p. lxxxiv.) quotes numerous instances in the 16th century, in some of which the husband was liable to a heavy fine in the event of his wife's non-compliance with the rule.

Sir G. G. Young in a pamphlet called The Place of the Lord Mayor in proceeding through or within the City of London (1852), quotes various royal visits to the city which seem to show that the Lord Mayor did not always wear his crimson velvet robe on these occasions. The robes of the Lord Mayor, as I, on going to meet Marie de Médicis, was met by the Lord Mayor of London, who was wearing the robe of Charles II. in 1660. In 1702, when Queen Anne went to a thanksgiving service at St. Paul’s, the Lord Mayor wore crimson velvet, with a scarlet collar and jewel; but in 1705, at the thanksgiving after Blenheim, he wore a black velvet robe, the sleeves of which were scarlet. In 1714, at the reception of George I., the Lord Mayor wore crimson velons.

The records had from an early date annual suits of robes like the mayor, aldermen, &c. See Liber Albus, p. 43: “Habet insignia Capitolis etiam in Quirinianis, quorum etiam Major et Aldermani capitum annuatim.” The chamberlain, common serjeant, &c., had also gowns (see an order of 1523 in St. J. Hope, ii. 146). For the word-bearer’s cap of maintenance see article CAP and St John and black gowns, and the members of the common council have deep marzaine blue gowns, which seem to have been first prescribed in 1761.

For Scotland an order of James I. and VI. of 1610 (see Register of Privy Council, loc. cit.) ordered that the provosts, aldermen, &c., of every borough should wear, for ordinary occasions, black furred gowns, the officers of the chief boroughs having also scarlet furred gowns for Sundays and other solemn occasions, when the provost of Edinburgh was to wear a gold chain.

Academic Costume.—No thorough study has so far been made of early English academic costume as compared with that of the continental universities—a study which ought to throw much light on the subject. A vexed question is that of how far academic dress is derived from the ecclesiastical. Anthony Wood’s view, that it was derived from the tunica talaris and cucullus of the Benedictines, would not now meet with much support; but the writers who have traced their pedigrees of the English academic robes, some of which are also at least a century younger than the English academic costumes, have traced such a connexion. An example of this is the robe worn at Oxford, as stated above, at the commencement of the 18th century.

After the 16th century the costume of the Lord Mayor can be studied in successive Orders or Ceremonial Books, accounts of coronations, &c., and in portraits and statues belonging to the various persons. Each Lord Mayor began to wear on some state occasions a black robe with gold lace, similar to that of the Lord Chancellor. The Ceremonial Book was thoroughly revised in 1864, and the latest edition is that issued in 1906 (Handbook of Ceremonials, &c., issued under the direction and with the approval of the Privy Council of the Court of Aldermen.”

At the present day the Lord Mayor has several sets of robes; a special coronation robe (see illustration in Naylor, Book of the Coronation of George IV., 1837), a crimson velour robe of state like that of an earl, worn with the chain and jewel, e.g. in the presence of the sovereign when in the city; a black robe of state trimmed with gold, which is worn with the chain and jewel, e.g. at the Guildhall on Lord Mayor’s Day; the scarlet robes, which are worn, with or without the chain, on most public occasions, such as the service at St. Paul’s on the first day of the Easter Law Term, audiences of the sovereign, the election of the Lord Mayor, the opening of the Central Criminal Court, &c.; a violet gown, which is worn, e.g. when the Lord Mayor enters in procession to the House of Commons, when he is sworn in, at the election of sheriffs, &c., and a black gown worn in church on Good Friday, &c. The aldermen wear scarlet at most occasions of ceremony, ex-mayors “having the Cap of Dignity attached to their gown, and being entitled to introduce a sword and mace into their badges.” Violet robes are also worn on certain occasions marked in the almanac of the Alderman’s Pocket Book; and black gowns when the Lord Mayor wears his. The sheriffs and recorders have scarlet, violet, and black gowns.

1 Sir G. G. Young in a pamphlet called The Place of the Lord Mayor in proceeding through or within the City of London (1852), quotes various royal visits to the city which seem to show that the Lord Mayor did not always wear his crimson velvet robe on these occasions. The robes of the Lord Mayor, as I, on going to meet Marie de Médicis, was met by the Lord Mayor of London, who was wearing the robe of Charles II. in 1660. In 1702, when Queen Anne went to a thanksgiving service at St. Paul’s, the Lord Mayor wore crimson velvet, with a scarlet collar and jewel; but in 1705, at the thanksgiving after Blenheim, he wore a black velvet robe, the sleeves of which were scarlet. In 1714, at the reception of George I., the Lord Mayor wore crimson velons.

The records had from an early date annual suits of robes like the mayor, aldermen, &c. See Liber Albus, p. 43: “Habet insignia Capitolis etiam in Quirinianis, quorum etiam Major et Aldermani capitum annuatim.” The chamberlain, common serjeant, &c., had also gowns (see an order of 1523 in St. J. Hope, ii. 146). For the word-bearer’s cap of maintenance see article CAP and St John.
ROBES

statute of 1432 de admissione ad pallium). Students, and even doctors in theology (Mun. Acad. ii. 393), were also restricted to black, and to black and white habits. The robes of masters were to be flowing and reach to the ankles (see Mun. Acad. p. 312, an order of 1358 to the tailors not to stit the robes, which should be "larga et talares," because clerks should be distinguished from the laity).

The Cope, worn as part of academic dress over the gown, probably originated in the ordinary capa clericalis, or everyday mantle of the clergy, which had been introduced into general use in England by synods of 1222, 1237 and 1268.1 This kind of cope, closed in front, and originally black in colour, is generally known as the capa clausa, and sometimes, for convenience sake, had a slit in front to allow of the passage of the hands. It was worn by Regent Masters when lecturing

survived to the present day at Cambridge as the dress worn by the Vice-Chancellor and by Regius Professors of Divinity, Law and Medicine, when present in regalia. It is open down the front, but the fur edging only reaches halfway down, marking the place where the slit used to be. At Oxford the so-called "cope" which is the Convocation robe of certain doctors is not a real cope, but is probably derived from the medieval tabard, the out-of-door dress worn by the clergy and others, it having become customary by the beginning of the 16th century for Regent Masters to wear the tabard at lectures as more convenient than the cope (Rashdall, II. ii. 639, and Mun. Acad. p. 421, where the pallium is spoken of as an alternative to the capa clausa. The pallium is most probably to be identified with the tabard).2 The capa manicata mentioned in Anstey (Mun. Acad. p. 421, &c.) seems to have been a shorter gown with bell-shaped sleeves reaching to the elbow, and lined with fur, worn by masters and bachelors of arts (see Druitt, p. 124), and a shorter tabard is also occasionally found (Robinson's Tabardum ad medias libras). These are illustrated in fig. 6 from a MS. of the 15th century at New College, Oxford.3 The D.D.'s wear the capa clausa, the other doctors tabards (see also pl. iii., vii. in Archaeologia, where William of Wykeham and all the Doctors wear long sweeping tabards, as ample as copes), the Warden a shorter tabard, reaching just below the knees, and the M.A.'s gowns or tabards with false sleeves.

The Hood was originally worn by all scholars, as by everybody, and had evidently no academic significance. Sometimes a cap was also worn, the hood being thrown back (Chaucer's "clerk of Oxenford" in the Ellesmere MS. illumination wears a red skull-cap, and a furred tippet and hood, with the hood falling rather back, though not on his shoulders). The liripipe became somewhat elongated, as is seen in the hoods of the so-called M.A. group in the Chandler MS. An early mention of the undergraduate hood is the much-discussed Oxford Statute of 1489 (Mun. Acad. p. 360), which reads: "ut nullus de cetero scholaris non-graduatus (nobili sanguine insignitis &c. exceptis) capio quovis utatu publice . . . nisi liripodium consuetum habeat et non contextum, propterea antiqua Universitatis laudabilis consuetudo exposcit . . ."5 but the undergraduate

2 Clark (pp. 138–39) treats of the pallium and tabard as two separate garments, declaring that the pallium was a kind of tippet but the pallium was to correspond to the tabard, his tabardum talare, which the Rev. T. A. Lacey (p. 128) also compares with the chimere of English bishops. (See article CHIMERE, where the chimere is likewise traced to the tabard.) Moroni, Dizionario dell'arte, also gives the terms "liripalium" and "liripodium" to the same general class of cloaks. Some of the canons of the university of Rome wear black sinoirre while teaching. This recalls the pallium of Regent Masters (Mun. Acad. p. 421) and Inceptors in arts and medicine (id. p. 430).

3 The Chandler MS. The drawings from which the illustration is taken are reproduced in the Transactions of the St. Paul's Ecclesiological Society, p. 208, with an explanatory article by the Rev. N. F. Robinson, and in Archaeologia, vol. lii. pl. i., with notes by T. F. Kirby, and Robinson identifies the various groups of Society of New College on his plate i. (xxv. in Archæol.) by the aid of a statute of the College settling the order of standing in choir and at processions, and thus claims to settle the question of the dress of the various sorts of Doctors and Bachelors M.A.'s, &c., at the period.

4 In the present article "liripodium" is used to mean that the tail of the hood, "tippet," of the shoulder-cape, sometimes forming part of the same garment as the hood, sometimes not, and "scarf" or the liripodium or scarf, e.g. of D.D.'s, Anglican clergy.

5 That no non-graduate scholar (with the usual exceptions of noblemen, &c.) shall wear any kind of hood in public, unless he have the liripodium sewn on, and not woven in one piece, as the ancient and venerable custom of the university demands." The meaning of "capio" here is "wears a garment," for the hood was used to mean that the tail of the hood should be sewn to the hood; others that the tail of the hood should be sewn to the gown; cf. Chaucer, Prolo. to Canon's, Yeoman's Tale: "Till that I understood How to the hood was sewn, I was so hard at heart, and long avised me, the demned some Chanion for be," which shows that this method of sewing the hood, whatever it was, was used to define rank; others again hold that "liripodium" here means a tippet or shoulder-cape, and that for some reason the hood was to be sewn to the tippet and not made all in one piece with it. Rashdall reads "consuetum" instead of "consuetum" (footnote ii. p. 641). The Constitution of Archbishop Bourchier (1463) forbids undergraduates to use liripopes or "tippets" round the neck in public (Clark, p. 85), so the sewing down of the liripe at the back may

415

hood had gone out of use by the end of the 16th century.1 Bachelors’ hoods were to be lined throughout with fur (Man. Acad. p. 361), which we learn from the statuté de admissione ad pellyrium (1432) to have been budge. Masters and noblemen might use miniver, or silk in summer (Man. Acad. pp. 283, 301). There were evidently hoods of at least two kinds for masters, sometimes called respectively cappitum and epomitis, whether corresponding to the distinction between regents and non-regents we do not now. (See Man. Acad. p. 638, will of Thomas Bray, M.A., and Robinson, loc. cit. In the Oxford Corpus Statutorum of 1768 the epomitis is worn with the ordinary gown, the cappitum with the scarlet habit.) At a later date, at Cambridge, a distinction was made between the hoods of non-regents, which were lined with silk, and those of regents, which were lined with miniver.2 Later again the regents wore their hoods in such a way as to show the white lining, while the non-regents wore theirs “squared,” so that the white did not show. Hence the name “White Hoods” and “Black Hoods” given to the upper and lower houses of the old Senate respectively. It is not settled when the modern colourings of hoods arose; they probably followed those of the gowns of the faculties, but about these we are equally uncertain. The Oxford Proctor still wears a miniver hood. The modern Cambridge student wears a hood of the same appearance as the Oxford one, being a hood and tippet combined, the hood having square corners. The tippet, which appears as part of the early costume of certain doctors, was probably, like the judges’ tippet, originally the shoulder-cape forming part of the same garment as the hood. Clark and others would derive it from the almac (g.v.), but do not seem to show any definite grounds for so doing. Its place seems to have been taken by the scarf worn by D.D.’s, &c., probably developed from the hood with long liripe worn as worn turban-wise on the head or as a scarf round the shoulders. It seems rather far-fetched to derive the scarf from the two pendants of the almac.3 (See article VESTMENTS and cp. the mayor’s scarf mentioned above.)

There seem to have been at least three varieties of academic head-dress: firstly, the doctor’s skull-cap with “apex” as illustrated in the Chandler MS. drawings; secondly, the square cap of cloth as prescribed by Laud’s statutes of 1636 for graduates and foundation scholars (similarly for Cambridge by Burleigh’s letter to vice-chancellor in 1688), with its counterpart of velvet worn by doctors; thirdly, a round cloth cap prescribed by the Laudian statutes and Burleigh’s letter for undergraduates who were not found to wear such a cap, given non-wearing of it in the examinations survives as part of their full dress to the present day. The square cap was adopted at the universities, according to Robinson, after 1520, in imitation of the university of Paris. For the development of the character of the “college cap,” see BRETTE. In this connexion should be mentioned the term “tuff-hunting,” i.e. attempting to thrust oneself into the society of one’s social superiors, derived from the gold tufts or tassels worn by noblemen and fellow-commoners on their college caps. As to the dresses of the different degrees, the drawings from the Chandler MS. give a good idea of the early costume. It is also well illustrated by brasses.4 Doctors of theology seem to have worn a tippet but no hood. Masters of Arts seem to have worn a gown, over which was a garment with bell-shaped sleeves reaching to the elbow, a tippet and a hood (see Druitt, plate facing p. 136, and p. 135). The academic dress was the skull-cap (the term of a (brass of John Palmer, B.A., d. 1479, New College, Oxford, in Druitt’s vol.) and the bachelors of law and divinity, the latter being generally already M.A.’s (Druitt, p. 139). Haines’s theory is that after the middle of the 15th century the third of M.A.’s was changed, and they wore the tabard reaching to the neck. This costume certainly occurs on brasses, chiefly of the 16th or 15th centuries, but the change is hard to explain.6

Academic dress underwent much inquiry and some revision at the time of the Reformation, chiefly in the direction of sobriety and uniformity, “excess of apparel” being repressed as severely as ever, but not with much more effect.7 Burleigh’s letter to the Vice-Chancellor of Cambridge University (1585), and the statutes of Queen Elizabeth, strictly enforce the wearing of cap and gown by all, and hoods and habits by those entitled to wear them, and similar regulations were made for Oxford by Laud’s statutes of 1633, further details being dealt with by a decree of 1770. Academic dress during the 17th century may be further studied in Bedel Buck’s Theologiae Baccalaurei Regentes, or Students, of Cambridge, 1667, and Appendix B to Peacock, Observations on the Statutes of the University of Cambridge, and Loggan’s plates of academic costume in Oxonia Illustrata (1675) and Cantabrigia Illustrata (1690, ed. J. W. Clark, 1905).

There have been few far-reaching changes since Loggan’s day. Cambridge has of late years inquired into and revised her regulations as to dress, and in the Ordinances (latest ed. 1908, Statute A, cap. VII. p. 303) clear rules are laid down; the Oxford regulations (see Statuta et Deedra Univ. Oxon.)5 see for doctors’ costume, J. G. and L. A. B. Waller’s Series of Monumental Brasses (London, 1864), plate of “Four Ecclesiastics,” from New College, Oxford, who are also illustrated in Druitt, pp. 131, 132, and M.A. and B.A. collegiate groups of plaques and plates facing p. 136. On the brass of John Lowthe, D.C.L., should be noticed the two curious long streamers or liripes hanging from the back of his tabard of hood. It is hard to say what they can be; but the closest parallel is in two streamers on the back of the old Oxford commoners’ gowns, which were probably survivals of sleeves. They are said to have given rise to the term “plucking,” i.e. failing in examination, the story being that a man’s creditors might assemble from going up for his degree.

It is just possible that this sleeved garment may be the capa manicana mentioned in Man. Acad. p. 421, “nullus regens in artibus ... in capa manicana lectiones legentem ordinarias, sed in pallio vel tippet, sive in pelliceo, sive pallio, cum privilegiis, quinque remiges cum tabard, &c., scilicet, a capa manicana; praeter illum tunicam, capa manicana cannot be the same. Braun, Liturgische Gewandung, p. 308, shows that a sleeved cope, called capa manicana, did in fact appear, but the closest parallel is to the garb of the clergy, at the end of the 12th century, its use being forbidden by various synods. It is possible, then, that the capa manicana may have worn by non-regents, the tabard (which Haines alleges to have been adopted generally by M.A.’s in the late 15th century), or pallium, by regents.

The essential parts of Laud’s statutes, Burleigh’s letter, &c., with much other matter bearing on academic costume from the earliest times to the very beginning of our own era, are found in Worsworth’s University Life in the 18th Century (London, 1824, vol. 2). To the passages quoted by him may be added the following from Johannes Berebloci Commentarii, an eye-witness’s account of Queen Elizabeth’s visit to Oxford in 1566 (published in Elizabethan Oxford, 1898), and from the magisterial instructions Mr. Campion, M.A., was dressed as follows: “Toga illius Dalmatica talaris fuit, maniciam remissam ad largitatem suas diffirmantium. Huic pallium inductum est undique consuetum, praeter quan majorem illius claviculae rectius dexterae manu inducta, maniciam albus, candelore laceintibus, redimiti. Atque his habitibus fuit omnium magistrorum, praeterea quod nonnulli, loco palludamentum illius pelliceri, serice utebantur, omni colori variagato.”

for 1809, Tit. xiv., de vestitiu et habitu, pp. 327–328) have not been revised lately, and some of them are a dead letter.

Doctors of both universities have three sets of robes: firstly, the full-dress gown of scarlet cloth; secondly, the congregation habit and hood of scarlet (now at Cambridge a cope, at Oxford the so-called “cope”); thirdly, the black gown. The first is worn by all doctors except the doctor of music, and is accompanied by the round cap of velvet. The Oxford D.D. also wears a cassock, sash and scarf. The scarlet gown is of a different and older shape than the M.A. and B.A. gowns. As now worn, it is faced with silk of the same colour as the hood of the faculty. The second, or cope, has now gone almost out of use, but is still worn when presenting for degrees, &c. It is sometimes worn over the black gown. There are several types of black gown, but the tufted gown of Loggan’s day has now gone out of use. The M.D. and Mus.D. black gowns at Cambridge are now made after the pattern of the L.L.D. gown, with wing-like sleeve and flap collar, trimmed with black lace, but the D.D., D.Sc. and Litt.D. wear the M.A. gown, the former with the scarf, the latter with lace on the sleeve, placed horizontally for D.Sc. and vertically for Litt.D. Some doctors of divinity wear the full-sleeved gown with scarf. The head-dress of a D.D. is the square cap, that of the lay doctors the velvet bonnet with gold cord. At Oxford, too, some doctors wear the M.A. gown, others the doctor’s laced gown. The M.A. and B.A. gowns are two varieties of the civilian gown of the 15th and 16th century. The B.A. loose-sleeved gown is no longer worn with the sleeve tucked up round the elbow.

The Oxford sleeveless commoner’s gown, though still by statute talaris, now reaches little below the waist, the full-sleeved scholar’s gown to the knees. The tufted silk gown of the gentleman-commoner and the nobleman’s gold-laced gown are not yet abolished by statute, but have fallen into disuse. Vice-Chancellors have no official costume, but wear the habit of their degree. The Chancellors of the older universities wear a black damask robe with gold lace, and a black velvet square cap with gold tassel or a doctor’s velvet bonnet with gold cord; those of the newer universities have robes “created” by the robe-makers, who are nowadays to a large extent the pupils of academic tailors.

For the colours of the hoods of the various university degrees see Universities ad fin. (C. B. P.)

ROBESPIERRE, MAXIMILIN FRANCOIS MARIE ISIDORE DE (1758–1794), French revolutionist, was born at Arras on the 6th of May 1758. His family, according to tradition, was of Irish descent, having emigrated from Ireland at the time of the Reformation on account of religion, and his direct ancestors in the male line had been notaries at the little village of Carvin near Arras from the beginning of the 17th century. His grandfather, being more ambitious, established himself at Arras as an advocate; and his father followed the same profession, marrying Jacqueline Marguerite Carnaut, daughter of a brewer in the same city, in 1757. Of this marriage four children were born, two sons and two daughters, of whom Maximilien was the eldest; but in 1767 Madame Robespierre, as the name was then spelt, died, and the disconsolate widower at once left Arras and wandered about Europe until his death at Munich in 1780. The children were taken charge of by their maternal grandfather and aunts, and Maximilien was sent to the college of Arras, whence he was nominated in 1770 through the bishop of his native town to a bursarship at the college of Louis-le-Grand at Paris. Here he had for fellow-pupils Camille Desmoulins and Stanislas Fréron.

Completing his law studies with distinction, and having been admitted an advocate in 1781, Robespierre returned to his native city to seek for practice, and to struggle against poverty. His reputation had already preceded him, and the bishop of Arras, M. de Conzié, appointed him criminal judge in the diocese of Arras in March 1782. This appointment, which he soon resigned, to avoid pronouncing a sentence of death, did not prevent his practising at the bar, and he speedily became a successful advocate. He now turned to literature and society, and came to be esteemed as one of the best writers and most popular dandies of Arras. In December 1783 he was elected a member of the academy of Arras, the meetings of which he attended regularly; and, like all other young Frenchmen with literary proclivities, he began to compete for the prizes offered by various provincial academies. In 1784 he obtained a medal from the academy of Metz for his essay on the question whether the relatives of a condemned criminal should share his disgrace, the prize being divided between him and Pierre Louis Lairetelle, an advocate and journalist in Paris. An éloge on J. B. L. Gresset (1709–1777), the author of Vert-Vert and Le Méchant, written for the academy of Amiens in 1785, was not more successful; but Robespierre was compensated for these failures by his great popularity in the little literary and musical society at Arras known as the “Rosati,” of which Carnot was also a member. There the sympathetic quality of Robespierre’s voice, which afterwards did him such good service in the Jacobin Club, always caused his indifferent verses to be loudly applauded by his friends.

In 1788 he took part in the discussion as to the way in which the state general and the new states would be elected, showing clearly and forcibly in his Adresse à la nation ardennaise that, if the former mode of election by the members of the provincial estates were again adopted, the new states-general would not represent the people of France. Necker also perceived this, and therefore determined to make the old royal baillages and sénechaussées the units of election, which thus took place on the basis of almost universal suffrage. Under this plan the city of Arras was to return twenty-four members to the assembly of the baillage of Artois, which was to elect the deputies. The corporation claimed the right to a preponderating influence in these city elections, and Robespierre headed the opposition, making himself very conspicuous and drawing up the cahier, or table of complaints and grievances, for the gild of the cobblers. Although the leading members of the corporation were elected, their chief opponent succeeded in getting elected with them. In the assembly of the baillage rivalry ran still higher, but Robespierre had already made his mark in politics; by the Aris aux habitants de Campagne (Arras, 1780), which is almost exclusively addressed to them, he expressed his opinions on the new corporation, and, though but thirty years of age, poor and without influence, he was elected fifth deputy of the tiers état of Artois to the states-general.

When the states-general met at Versailles on 5th May 1789, the young deputy of Artois already possessed the one faculty which was to lead him to supremacy: he was a fanatic. As Mirabeau is reported to have said: “That young man believes what he says: he will go far.” Without the courage and wide tolerance which make a statesman, without the greatest qualities of an orator, without the belief in himself which marks a great man, nervous, timid and suspicious, Robespierre yet believed in the doctrines of Rousseau with all his heart, and would have gone to death for them; and in the belief that they would eventually succeed and regenerate France and mankind, he was ready to work with unwearied patience. While the Constituent Assembly occupied itself in drawing up a constitution, Robespierre turned from the assembly of provincial lawyers and wealthy tradesmen to the people of Paris. However, he spoke frequently in the Constituent Assembly, and often with great success, and was eventually recognized as second only to Pétion de Villereneuve—if second to him—as a leader of the small body of the extreme left,—the thirty voices, as Mirabeau contemptuously called them. It is hardly necessary to examine minutely Robespierre’s speeches and behaviour before 1791, when the death of Mirabeau left the way clear for the influence of his party; but what is noteworthy, as proving the religious cast of his mind and his belief in the necessity of a religion, is that he spoke several times in favour of the lower clergy and laboured to get their pensions increased. When he instinctively felt that his doctrines would have no success in the Assembly, he turned to the Society of the Friends of the Constitution, known
later as the Jacobin Club, which had consisted originally of the Breton deputies only, but which, after the Assembly moved to Paris, began to admit among its members various leaders of the Parisian bourgeoisie. As time went on, many of the more intelligent artisans and small shopkeepers became members of the club, and among such men Robespierre found the hearers he sought. They did more than listen to him: they idolized him; the fanatical leader had found followers. As the wealthier bourgeoisie of Paris and deputies of a more moderate type succeeded to the club of '89, the influence of the old leaders of the Jacobins (Barnave, Dupont, Alexandre de Lameth) diminished; and when they themselves, alarmed at the progress of the Revolution, founded the club of the Feuillants in 1792, the followers of Robespierre dominated the Jacobin Club. The death of Mirabeau strengthened Robespierre's influence in the Assembly; but on the 5th of May 1791 he proved his lack of statesmanlike insight and his jealous suspicion of his colleagues by proposing and carrying the motion that no deputies who sat in the Constituent could sit in the succeeding Assembly. The flight of the king on the 20th of June and his arrest at Varennes made Robespierre declare himself at the Jacobin Club, "Robespierre, lắp Revolution, of the Champ de Mars (on the 23rd of June) he established himself, in order to be nearer to the Assembly and the Jacobins, in the house of Duplay, a cabinetmaker in the Rue St Honoré, and an ardent admirer of his, where he lived (with but two short intervals) till his death. At last came his day of triumph, when on the 30th of September, on the dissolution of the Constituent Assembly, the people of Paris crowned Pétion and himself as the two incorruptible patriots.

On the dissolution of the Assembly he returned for a short visit to Arras, where he met with a triumphant reception. In November he returned to Paris, and on the 18th of December a speech which marks a new epoch in his life. Brissot de Warville, the âme politique of the Girondins party which had been formed in the Legislative Assembly, urged vehemently that war should be declared against Austria, and the queen was equally urgent, in the hope that a victorious army might restore the old absolutism of the Bourbons. Two men opposed the projects of the queen and the Girondins—Marat and Robespierre; the former feared the development of militarism, which might be turned to the advantage of the king; the latter opposed from those whom they had expected to aid them irritated the Girondins greatly, and from that moment began the struggle which ended in the coup d'état of the 3rd of May and the 2nd of June 1793. Robespierre persisted in his opposition to the war; the Girondins, especially Brissot, attacked him violently; and in April 1792, he resigned the post of public prosecutor at the tribunal of Paris, which he had held since February, and started a journal, Le Défenseur de la Constitution, in his own defence. It is noteworthy that during the summer months of 1792 in which the fate of the Bourbon dynasty was being sealed, neither the Girondins in the Legislative Assembly nor Robespierre took any active part in overthrowing it. Stronger men with practical instincts of statesmanship, like Danton and Billaud Varenne, who dared to look facts in the face and take the responsibility of doing while others were talking, were the men who made the 10th of August and took the Tuileries. The Girondins, however, were quite ready to take advantage of the accomplished fact; and Robespierre, likewise, though shocked by the shedding of blood, waited to take his seat on the Commune of Paris, which had overthrown Louis XVI, and might check the Girondins. The strong men of the Commune were glad to have Robespierre's assistance, not because they cared for him or believed in him, but because of the help got from his popularity, his reputation for virtue, which had won for him the surname of "The Incorruptible," and his influence over the Jacobin Club and its branches, which spread all over France. He it was who presented the petition of the Commune of Paris on 16th August to the Legislative Assembly, demanding the establishment of a revolutionary tribunal and the summoning of a Convention. The massacres of September in the prisons, which Robespierre in vain attempted to stop, showed that the Commune had more confidence in Billaud than in him. Yet, as a proof of his personal popularity, he was a few days later elected first deputy for Paris to the National Convention.

On the meeting of the Convention the Girondins immediately attacked Robespierre; they were jealous of his influence in Paris, and knew that his single-hearted fanaticism would never forgive their intrigues with the king at the end of July. As early as the 26th of September the Girondin M. D. A. Lasource accused him of aiming at the dictatorship; afterwards he was informed that Marat, Danton and himself were plotting to become triumvirs; and eventually on the 20th of October Louvet de Couvrai attacked him in a studied and declamatory harangue, abounding in ridiculous falsehoods and obviously concocted in Madame Roland's boudoir. But Robespierre had no difficulty in rebutting this attack (5th of November), while he denounced the federalist plans of the Girondins. All personal disputes, however, gave way by the month of December 1792 before the great question of the king's trial, and here Robespierre took up a position which is at least easily understood. There are few words spoken on the 3rd of December: "This is no trial; Louis is a prisoner at the bar; you are not judges; you are—you cannot but be—he, and you, the representatives of the nation. You have not to pass sentence for or against a single man, but you have to take a resolution on a question of the public safety, and to decide a question of national foresight. It is with regret that I pronounce the fatal truth: Louis ought to perish rather than a hundred thousand virtuous citizens; Louis must die, that the country may live." This great question settled by the king's execution, the struggle between Robespierre and the Girondins entered upon a more acute stage, and the want of statesmanship among the latter threw upon the side of the fanatical Robespierre Danton and all those strong practical men who cared little for personal questions, and whose only desire was the victory of France in her great struggle with Europe. Had it been at all possible to act with that group of men of genius whom history calls the Girondins, Danton, Lazare Carnot, Robert Lindet, and even Billaud-Varenne, would have sooner thrown in their lot with them than with Robespierre, whom they themselves considered the strongest of the Girondins, spurred on by Madame Roland, refused to have anything to do with Danton. Government became impossible; the federalist idea, which would have broken France to pieces in the very face of the enemy, grew and flourished, and the men of action had to take a decided part. In the month of May 1793 Camille Desmoulins, acting under the inspiration of Robespierre and Danton, published his Histoire des Brissotins et Brissot démasqué; Maximin Isnard declared that Paris must be destroyed if it pronounced itself against the provincial deputies; Robespierre preached insurrection at the Jacobin Club; and on the 31st of May and the 2nd of June the Commune of Paris destroyed the Girondin party. For a moment it seemed as if France would avenge them; but patriotism was stronger than federalism. The defence of Lyons exasperated the men who were working for France, and the armies who were fighting for her, and on the 27th of July 1793, when the struggle was practically decided, the Convention elected Robespierre to the new Committee of Public Safety. He had not solicited, so it seems, nor had he Purged the election, yet it marked an important epoch, not only in the life of Robespierre, but in the history of the Revolution. Danton and the men of action had throughout the last two years of the crisis, as Mirabeau had in the first two years, seen that the one great need of France, if she was to see the end of her troubles without the interference of foreign armies, was the existence of a strong executive government. The means for establishing the much-needed strong executive were found in the Committee of Public Safety. The success of this Committee in suppressing the Norman insurrection had confirmed the majority of the Convention in the expediency of strengthening its powers, and the Committee of General
Security which sat beside it was also strengthened and given the entire management of the internal police of the country. It was not until Robespierre was elected to the Committee that he became one of the actual rulers of France. Indeed, the Committee was not finally constituted until the 13th of September, when the last two of the “great” twelve who held office until July 1794 were elected. Of these twelve at least seven—Lazare Carnot, Billaud-Varenne, Collot d’Herbois, Prieur Duvernois (of the Marne), Prieur (of the Côte d’Or), Jean Bon Saint-André and Robert Lindet—were essentially men of action, and were entirely free from the influence of Robespierre. Of the other four, Hérault de Séchelles was a professed adherent of Danton, Barère de Vieuzeau was an eloquent Provencal, who was ready to be the spokesman to the Convention of any view which the majority of the Committee might adopt; and only Georges Couthon and Saint-Just, devoted to Robespierre, adroitly sustained his policy. It is necessary to dwell upon the fact that Robespierre was always in a minority in the great Committee in order to absolve him from the blame of being the inventor of the Terror, as well as to deprive him of the glory of the gallant stand made against Europe in arms.

After this examination of Robespierre’s position it is not necessary to investigate closely every act of the great Committee during the year which was called the year of the Terror, and to examine his personal position with regard to the establishment of the Terror and the fall of the Hébertists and Dantonists, and then to dwell upon the last three months in which he stood almost alone trying to work up an effective counterbalance to the power of the majority of the great Committee. The Terror was the embodiment of the idea of Danton, that it was necessary to have resort to extreme measures to keep France united and strong at home in order to meet successfully her enemies upon the frontier. This idea was systematized by the Committee of Public Safety. With the actual organization of the Terror Robespierre had little or nothing to do; its two great engines, the revolutionary tribunal and the almost absolute power in the provinces of the representatives on mission, were in existence before he joined the Committee of Public Safety, and the laws of the maximum and of the suspects were by no means of his creation. The reason why he is almost universally regarded as its creator and the dominant spirit in the Committee is not hard to discover. Men like Lazare Carnot and Billaud-Varenne were not conspicuous speakers in the Convention, nor did the orators of any section of the populace; but Robespierre had a fanatical following among the Jacobins and was one of the most popular orators in the Convention, on which he carefully prepared addresses often made a deep impression. His panegyrics on the system of revolutionary government and his praise of virtue led his hearers to believe that the system of the Terror, instead of being monstrous, was absolutely laudable; his pure life and admitted incorruptibility threw a lustre on the Committee of which he was a member; and his colleagues offered no opposition to his posing as their representative and reflecting some of his personal popularity upon them so long as he did not interfere with their work. Moreover, he alone never left Paris, whilst all the others, except Barère, were constantly engaged on missions to the armies, the navy and the provinces. It has been asserted that Robespierre, Couthon and Saint-Just took upon themselves the direction of “la haute politique,” while the other members acted only in subordinate capacities; undoubtedly it would have suited Robespierre to have had this believed, but as a matter of fact he was in no way especially trusted in matters of supreme importance.

After this explanation it may be said at once that Robespierre was not the sole author of the overthrow of the Dantonists and the Hébertists, though he thoroughly agreed with the majority and had no desire to save them, the principles of both parties being obnoxious to him. The Hébertists were communists in the true meaning of the word. They held that each commune should be self-governing, and, while admitting the right of a central authority to levy men and money for the purposes of the state, they believed that in purely internal matters, as well as in determining the mode in which men and money were to be raised, the local government ought to be supreme. This position of the Hébertists was of course obnoxious to the Committee, who believed that success could only be won by their retention of absolute power; and in the winter of 1794-1795 it became obvious that the Hébertist party must perish, or its opposition to the Committee would grow too formidable owing to its paramount influence in the Commune of Paris. Robespierre shared his colleagues’ fear of the Hébertist opinions, and he had a personal reason for disliking that party of atheists and sansculottes, since he believed in the necessity of religious faith, and detested their imitation of the grossness that belongs to the lowest class of the populace. In 1792 he had indignantly thrown from him the cap of liberty which an ardent admirer had placed upon his head; he had never pandered to the depraved tastes of the mob by using their language; and to the last day of his life he wore knee-breeches and silk stockings and wore his hair powdered. His position towards the Dantonist party was of a different character. After having established the strong executive he had to guard against any danger of the Committee, which finally consolidated the power of the Committee of Public Safety in September 1793, Danton retired to his country house. But to his retreat came the news of the means the Committee used to maintain their supremacy. Danton did not believe that this continuous series of sacrifices under the guillotine was necessary, especially since the danger to the country had passed away with the victories of the revolutionary army; hence he inspired Camille Desmoulins to protest against the Terror in the Vieux Cordelier. Where is this system of terror to end? What is the good of a tyranny comparable only to that of the Roman emperors as described by Tacitus? Such were the questions which Camille Desmoulins asked under Danton’s inspiration. This “moderantism,” as it was called, was as objectionable to the members of the Committee as the doctrines of the Hébertists. Both parties must be crushed. Before the blows at the leaders of those two parties were struck, Robespierre retired for a month (from 13th February to 13th March 1794) from active business in the Convention and the Committee, apparently to consider his position; but he came back to the Convention, which at last deposed him, to work up the influence of the other members of the Committee over the armies by getting his young adherent, Saint-Just, sent on a mission to the frontier. In Paris Robespierre determined to increase the pressure of the Terror: no one should accuse him of moderateantism; through the increased efficiency of the revolutionary tribunal Paris should tremble before him as the chief member of the Committee; and the Convention should pass whatever measures he might dictate. To secure his aims, Couthon, his other ally in the Committee,
proposed and carried on the 10th of June the outrageous law
of 22nd Prairial, by which even the appearance of justice was
taken from the tribunal, which, as no witnesses were allowed,
became a simple court of condemnation. The result of this
law was that between the 12th of June and the 28th of July,
the day of Robespierre's death, no less than 1285 victims
perished by the guillotine in Paris. It was the bloodiest
and the least justifiable period of the Terror. But before this
there had taken place in Robespierre's life an episode of supreme
importance, as illustrating his character and his political aims:
on the 7th of May he secured a decree from the Convention
recognizing the existence of the Supreme Being. This worship
of the Supreme Being was based upon the ideas of Rousseau
in the Social Contract, and was opposed by Robespierre to
Catholicism on the one hand and the Hébertist atheism
on the other. In honour of the Supreme Being a great fête
was held on the 8th of June; Robespierre, as president of the
Convention, walked first and delivered his harangue, and as he
looked around him he may well have believed that his position
was secured and that he was at last within reach of a supreme
power which should enable him to impose his belief on all
France, and so ensure its happiness. The majority of the
Committee found his popularity—or rather his ascendancy,
for he had increased his personal popularity—useful to them,
and since the expiration of the Terror he strengthened the position of the Committee, whilst attracting
himself, as occupying the most prominent position in it,
any latent feeling of dissatisfaction at such stringency.

Of the issue of a struggle between themselves and Robes-
pierre they had little fear: they controlled the Committee
of General Security through their alliance with its leaders,
André Amar and Marc Guillaume Alexis Vadier; they
were hopeful of obtaining a majority in the Convention; for they
knew that the chief deputies on the left, or "the Mountain,"
were Dantonists, who burned to avenge Danton's death;
while they felt sure also that the mass of the deputies of the
centre, or "the Marsh," could be hounded on against Robes-
pierre if they were to accuse him of aiming at the dictatorship
and pour on him the obloquy of having increased the Terror
when victory on the frontier rendered it less necessary;
and they knew finally that his actual adherents, though devoted
to him, were few in number. The devotion of these admirers
had been further excited by the news that a half-witted girl,
named Cécile Renault, had been found wandering near his
house, with a knife in her possession, intending to play the
part of Charlotte Corday. So on the 22nd of July, 1794,
the very day that Vadier raised a laugh at Robes-
pierre's expense in the Convention by his report on the
conspiracy of Catherine Théot (q.v.), a mad woman, who had
asserted that Robespierre was a divinity.

Robespierre felt that he must strike his blow now or never.
Yet he was not sufficiently audacious to strike at once, as Payan
and Jean Baptiste Cofinhall, the ablest of his adherents, would
have had him do, but retired from the Convention for some
weeks, as he had done before the overthrow of the Hébertists
and the Dantonists, to prepare his plan of action. This retire-
ment seemed ominous to the majority of the Committee, and
they too prepared for the struggle by communicating with the
deputies of the Mountain, who were either friends of Danton
or men of proved energy like Barras, Fréron and Tallien.
These weeks, the last of his life, Robespierre passed very peace-
fully, according to his wont all through the Revolution. He
continued to live with the Duplays, with whose daughter
Eléonore he had fallen in love, and used to wander with her and his
favourite dog, a great Danish hound, named Bruant, in the
Champs Élysées during the long summer evenings. At last,
early on the 26th of July, Robespierre appeared the last time for
more than four weeks, in the Convention and delivered a care-
fully studied harangue, which lasted for more than four hours,
in which he declared that the Terror ought to be ended, that
certain deputies who had acted unjustly and exceeded their
powers ought to be punished, and that the Committees of
Public Safety and General Security ought to be renewed. Great
was the excitement in the Convention; all wondered who were
the deputies destined to be punished; all were surprised that
the Terror should be imputed as a fault to the very Committee
of which Robespierre had been a member. The majority of the
Committee of Public Safety determined to act promptly. The
Convention, moved by Robespierre's eloquence, at first passed
his motions; but he was replied to by Joseph Cambon the
financier, Billaud-Varenne, Amar and Vadier, and the Con-
vention rescinded their decrees and referred Robespierre's question to their committees. On the following day, the 27th
of July, or in the revolutionary calendar the 9th Thermidor,
Saint Just began to speak on behalf of the motions of Robes-
pierre, when violent interruptions showed the temper of the Convention. Jean Lambert, Tallien, Billaud-Varenne and Vadier again attacked Robespierre; cries of "Down with the tyrant!" were raised; and, when Robespierre hesitated in his speech in answer to these attacks, the words "C'est le sang de
Danton qui t'entouffe" showed what was uppermost in the minds of
the Mountain. Robespierre tried in vain to gain a hearing,
the excitement increased and at five in the afternoon Robespierre,
Couthon and Saint-Just, with two young deputies, Augustin Robespierre (younger brother of Maximilien) and Philippe
Fromageot; Joseph Lebas, the only men in all the Convention
who supported them, were ordered to be arrested. Yet all hope
for Robespierre was not gone; he was speedily rescued from
his prison, with the other deputies, by the troops of the
Commune and brought to the Hôtel de Ville. There he was
surrounded by his faithful adherents, led by Payan and Cofinhall.
But the day was past when the Commune could overawe the
Convention; for now the men of action were hostile to the
Commune, and its chief was not a master of coups d'état.
On the news of the release of Robespierre, the Convention had
again met, and declared the members of the Commune and
the released deputies outlawed. The national guards under the
command of Barras had little difficulty in making their way
to the Hôtel de Ville; Robespierre was shot in the lower jaw
by a young gendarme named Meda while signing an appeal
one of the sections of Paris to take up arms for him, though the
wound was afterwards believed to have been inflicted by him-
sell; and all the released deputies were again arrested. After
a night of agony, Robespierre was the next day taken before
the tribunal, where his identity as an outlaw was proved, and
without further trial he was executed with Couthon and Saint-
Just, who was sentenced to death for his adherents on the Place
of the Revolución on the 10th Thermidor (26th July) 1794.

The character of Robespierre, when looked upon simply in the
light of his actions and his authenticated speeches, and apart
from the innumerable legends which have grown up about it,
not is a difficult one to understand. A well-educated
and accomplished young lawyer, he might have acquired a good
provincial practice and lived a happy provincial life had it
not been for the Revolution. Like thousands of other young
Frenchmen, he had read the works of Rousseau and taken them
as gospel. Just at the very time in life when this illusion had
not been destroyed by the realities of life, and without the
experience which might have taught the futility of idle dreams
and theories, he was elected to the states-general. At Paris
he was not understood till he met with his audience of fellow-
disciples of Rousseau at the Jacobin Club. His fanaticism
won him supporters; his singularly sweet and sympathetic
voice gained him hearers; and his upright life attracted the
admiration of all. As matters approached nearer and nearer
to the terrible crisis, he failed, except in the two instances
of the question of war and of the king's trial, to show himself
a statesman, for he had not the liberal views and practical instincts
which made Mirabeau and Danton great men. His submission
to the Committee of Public Safety gave him power, which he
hoped to use for the establishment of his favourite theories,
and for the same purpose he acquiesced in and even heightened
the horrors of the Reign of Terror. It is here that the fatal mistake of allowing a theorist to have power appeared:
Billaud-Varenne systematized the Terror because he believed it necessary for the safety of the country; Robespierre intensified it in order to carry out his own ideas and theories. Robespierre’s private life was always respectable; he was always emphatically a gentleman and man of culture, and even a little bit of a dandy, scrupulously honest, truthful and charitable. In his habits and manner of life he was simple and laborious; he was not a man gifted with flashes of genius, but one who had to think much before he could come to a decision, and he worked hard all his life.

On the family of Robespierre see A. J. Paris in the Mémoires (2nd series, vol. iii.) of the Academy of Arras; the Œuvres de Maximilien Robespierre (3 vols., 1840), published by Laponneraye with preface by Armand Carrel, contain some of his speeches and the memoirs of Charlotte Robespierre on her brothers. The standard work on Robespierre’s career is Ernest Hamel, Histoire de Robespierre d’après des papiers de famille, des sources originales et des documents entièrement inédits (3 vols., 1865-67). After the appearance of the first volume, the publisher refused to proceed for fear of prosecution until compelled to do so by the author. Another edition with a different title appeared in 1878. See also Ch. d’Hericiol, La Révolution de Thermidor (2nd ed., 1878); Karl Brunemann, Maximilian Robespierre (Leipzig, 1880); F. A. Aubry, Les Orateurs de la Révolution française (Paris, 1881); and G. Durand, “Le Romain de Robespierre,” in La Société française pendant la Terreur (1882); E. Hamel, La Maison de Robespierre (1895); Hilaire Belloc, Robespierre (1901); and C. F. Warwick, Robespierre and the French Revolution (1901). Many of the books which have been written about Robespierre are most untrustworthy, and the picture given by them is probably that given by Thomas Carlyle in his French Revolution is unjust.

ROBILANT, CARLO FELICE NICOLIS, CONTE DI (1826-1888), Italian statesman and diplomat, was a native of Turin. He entered the army, and lost his left hand at Novara, where he was aide-de-camp to Charles Albert, king of Piedmont. He fought in 1859, and reached the grade of general in the Austrian campaign of 1866, after which he served on the delimitation commission. He was chief of the Military Academy, and in 1867 was made prefect of Rovenna to suppress political disorder. He was defeated at Turin in the elections for the Chamber in 1870, and was sent in 1871 as minister plenipotentiary to Vienna, where he subsequently became ambassador. He was connected with the Prussian nobility by his mother, and he married an Austrian, a daughter of Prince Edmund Clary-Aldringen. In spite of the active share he had taken in driving Austria from Italy, he was a persona grata at Vienna, and his policy was steadily directed to an alliance between the two powers. This was accomplished by the secret terms of the Triple Alliance in 1887. He was recalled to Rome in 1885 to become minister for foreign affairs in the Depretis cabinet. Robilant’s independent attitude as foreign minister secured greater consideration for Italy from her allies, but he did not adapt himself to the exigencies of domestic politics, and his excessive unpopularity contributed to the downfall of the ministry on the 7th of February 1887, consequent on an adverse vote on the Massawa question. Before leaving office, he completed the negotiations for the renewal of the Triple Alliance, and for its extension to cover Anglo-Italian co-operation in the Mediterranean. In the new Depretis-Crispi administration Robilant was not included. He was sent to London as ambassador in the next year, but died two months after his arrival, on the 17th of October 1888.

ROBIN HOOD, English legendary hero. The oldest mention of Robin Hood at present known occurs in the second edition—what is called the B text—of Piers the Plowman, the date of which is about 1377. In passus v. of that poem the figure of Sloth is represented as saying—

"I can nought perfectly my pater-noster, as the prest it sygnet."

But I can rymes of Robyn Hood and Randolf Erle of Chestre."

He is next mentioned by Andrew of Wyntoun in his Original Chronicle of Scotland, written about 1420—

"Lytel Jhon and Robyn Hude Waythmen ware commendyd gude:
In Ynglweode and Barnysale
Thai oysyd all this time [c. 1263] thare trawale ";

next by Walter Bower in his additions of Fordun’s Scotichronicon about 1450—

"Hoc in tempore [1266] de exheredatis et bannitis surrexit et caput erexit ille famesissimus siciarius Robertus Hode et Littill Johanne cum eorum complicibus, de quibus stolidum vulgos hiander in comodiosis et tragodesii prurientum est facium et super ceteras rerum, imos, er barbados cantitare delectantur."

Of his popularity in the latter half of the 15th and in the 16th centuries there are many signs. Just one passage must be quoted as of special importance because closely followed by R. Grafton, J. Stow and W. Camden. It is from John Mair’s Historia Majoris Britanniae tam Angliae quam Scotiae, which appeared in 1521—

In the Elizabethan era and afterwards mentions abound; see the works of Shakespeare, Sidney, Ben Jonson, Drayton, Warner, A. Munday, Camden, Stow, Braithwaite, Fuller, &c.

Of the ballads themselves, Robin Hood and the Monk is possibly as old as the reign of Edward II. (see Thomas Wright’s Essays on England in the Middle Ages, ii. 174; Robin Hood and the Potter and Robyn and Gandelyne are certainly not later than the 15th century. Most important of all is A Lytell Geste of Robyn Hode, which was first printed about 1510 (see A. W. Pollard’s Fifteenth Century Prose and Verse, Westminster, 1903). This is evidently founded on older ballads; we read in The Second Fylle, ii. 176 and 177—

"He wente hym forth full mery syngeye,
As men have told in tale."

In fact, it does for the Robin Hood cycle what a few years before Sir Thomas Malory had done for the Arthurian romances; what in the 6th century B.C. Pseustus is said to have done for the Homeric poems.

These are the facts about him and his balladry. Of conjectures there is no end. He has been represented as the last of the Saxons—as a Saxon holding out against the Norman conquerors so late as the end of the 11th century (see Augustin Thierry’s Norman Conquest, and compare Sir Walter Scott’s Ivanhoe). J. M. Gutch maintains that he was a follower of Simon de Montfort. The Rev. Joseph Hunter associated him with the rebel earl of Lancaster of Edward II.’s time. This scholar in a brochure published in 1852 produced evidence from the exchequer accounts and the court rolls of the manor of Wakefield showing that a "Robyn Hod" and a "Robertus Hood" were living in this reign. The series of coincidences to which he points is undoubtedly striking, but had failed to convince most critics. Professor F. J. Child dismisses his inferences as "ludicrous."

For our part, we are not disinclined to believe that the Robin Hood story has some historical basis, however fanciful and romantic the superstructure. We parallel it with the Arthurian story, and hold that, just as there was probably a real Arthur, however different from the hero of the trouvères, so there was a real Hood, however now enlarged and disguised by the accretions of legend. That Charlemagne and Richard I. of England became the subjects of romances does not prevent our believing in their existence; nor need Hood’s mythical life deprive him of his natural one. Sloth in Langland’s poem couples him, as we have seen, with Randle, earl of Chester; and no one doubts this nobleman’s existence because he had “rymes” made about him. We believe him to have been the third Randle (see Bishop Percy’s Folio MS., ed. Hales and Furnivall, i. 260). And possibly enough Hood was contemporary with that earl, who “flourished” in the reigns of Richard I., John and Henry III.

Wyntoun and Mair, as we have seen, assign him to that period. It is impossible to believe with Hunter that he lived so late as Edward II.’s reign. This would leave no time for the growth
of his myth; and his myth was, as is evident from what we have already said and quoted, fully-grown in the first half of the 14th century. Whatever may have been the immediate genesis of the myth—and it may well be sought in the heartless forest laws—its vitality was assured by the English love of archery and historical repetition. In the rolls of parliament of 1347 mention is made of Piers Venables, a robber who took to the woods "like as it had been Robin Hood and his meyne." There are indications that Robin was identified or confused with Robert Locksley, a man-slayer of Bradfield in Hallamshire. The former is said to have been born in "Merry sweet Locksley town."

But whether he lived or not, and whenever he lived, it is certain that many mythical elements are contained in his story. Both his name and his exploits remind us of the woodland spirit Robin Goodfellow and his merry pranks. He is fond of disguising himself, and devoted to fun and practical jokes. These frolics suggest the wind. "The whole story," says Mr H. Bradley, "is ultimately derived from the great Arany sun-myth. Robin Hood is Hod, the god of the wind, a form of Woden; Maid Marian is Morgen, the dawn-maiden; Friar Tuck is Tuck, the spirit of frost and snow." The name Robin (a French form from Rob, which is of course a short form for Robert) would serve both for "the shrewd and knavish sprite"—the German Knecht Ruprecht (see Grimm's Teut. Myth. p. 504, trans. Stallybrass)—and for the bandit (see "Roberdes Knawe" in the Prologue of Piers the Plowman, I.44, and the note in Warton's Hist. of Eng. Poet. ii. 95, ed. 1840). Hood is a very usual dialectal form of wood; and in his play Edward the First, George Peele actually alludes to the bandit as "Robin of the Wood." Mr Gutch also explains the origin of the name. It is still a common enough surname, of which the earlier shape is Odo (see "Houdart," R. C., in Larchey's Dict. des Noms); notice, too, the name Hudson. But it also reminds one of the German familiar spirit Hoodken, or possibly of the German Wittkind (see Wright's Essays on the Middle Ages, ii. 207). Mr Sidney Lee suggests that Robin was a forest elf so called because elves wore hoods (see Dict. of National Biography, sub. "Robin Hood"). How certain it is that the Robin Hood story attracted to it and appropriated other elements is illustrated by its subsequent history—its history after the 14th century. Thus later on we find it connected with the Morris dance; but the Morris dance was not known in England before the 16th century or late in the 19th. The Friar Tuck and Maid Marian elements have been thought to have been introduced for the purpose of these performances, which were held on May-day and were immensely popular (see Latimer's Fruitfull Sermons (London, 1571), p. 75; also Paston Letters, ed. J. Gairdner, iii. 89). After 1615, the date of the pageant prepared for the majesty of Sir John Jolles, draper, by Anthony Munday and entitledMetropolis Coronata, a peer was imported into it, and the yeoman of the older version was metamorphosed into the earl of Huntingdon, for whom in the following century William Stukeley discovered a satisfactory pedigree! The earl of Huntingdon was probably a nickname for a hunter. At last, with the change of times, the myth ceased growing. Its rise and development and decay deserve a more thorough study than they have yet received.

What perhaps is its greatest interest as we first see it is its expression of the popular mind about the close of the middle ages. Robin Hood is at that time the people's ideal as Arthur is that of the upper classes. He is the ideal yeoman as Arthur is the ideal knight. He readjusts the distribution of property: he robs the rich and endows the poor. He is an earnest warrior, a formidable archer, the lover of the Greenwood and of a free life, brave, adventurous, jocund, open-handed, a protector of women. Observe his instructions to Little John—

"Loke ye do no housbonde harne
That tytlesh with his plough;
No more ye shall no good yeman
That walketh by grene wode shave;"

"Ne no knyght ne no squire
That wolde be a good felawe;
These bysshepshys and thys archeybyshys
Ye shall them bete and bynde;
The bynaer of the weather
Hym holde in your mynde."

And we are told—

"Robin loved our dere lady;
For doute of deley synne
Wolde he never do company harne
That ony woman was yyne."

See also Drayton's Polyolbion, Song xxxvi. The story is localized in Barnsdale and Sherwood, i.e. between Doncaster and Nottingham. In Yorkshire, Notinghamshire and Lincolnshire a host of place-names testify to the popularity of the Robin Hood legend—Robin Hood's Bay, Robin Hood's Cave, Robin Hood's Chase, Robin Hood's Cup (a well), Robin Hood's Chair, Robin Hood's Prieks, and many more.

The best collections of Robin Hood poems are those of Ritson (1779-84, ed. G. and J. G., and of Professor Child in the 8th volume of his invaluable English and Scotch Popular Ballads (Boston, 1888). See also Professor F. B. Gummere's Old English Ballads (Boston, 1894). The versions in the Percy Folio (edited by Hales and Furness, 1867, vol. i.) are unhappily mutilated; but they should be consulted, for they are all more or less unique, and that on "Robin Hood's death" is of singular interest. The literary and artistic value of many of the Robin Hood ballads is pronounced considerable, but eight of them attain the high-water mark of their class. Robin Hood and the Monk and Guy of Gisborne are perhaps the best. There is, however, real vigour and force in this fragment on the hero's death. The earliest "Garland" was printed in 1670, and in 1679 appeared a prose version which was reprinted by W. J. Thomas in his Early English Prose Romances (vol. ii., 1888). Mr Lee's memoir in the Diction- ary of National Biography is extremely erudite, and two valuable articles, contributed by Sir Edward Brabrook to the Antiquary for June and July 1906, might be consulted. See also Stukeley, Palaecographia Britannica, No. i. 115; Thierry, Conquete de l'Ancien siecle (1829); and J. Hunter's Great Hero of the Ancenzi Minstrelsy of England, Robin Hood (1852).

ROBIN HOOD'S BAY, a seaside resort in the Whitby parliamentary division of the North Riding of Yorkshire, England, 63 m. S.E. of Whitley, by a branch of the North-Eastern railway. The bay and island are a sand bar. The coast, which is fringed with high picturesque cliffs, breached in places by steep-sided narrow gullies. The old fishing village overhangs the cliffs, while the more modern watering-place is mostly built a little inland. A fine stretch of sandy shore is exposed at low tide.

ROBINIA, or LOCUST-TREE, a genus of about six species native of the United States and Mexico, belonging to the sub-family Papilionaceae of the great family Leguminosae. It was named by Linnaeus in honour of Jean Robin (1550-1629), herbalist to the king of France and his son and successor, Vespasian Robin (1579-1660) by whom the best-known species, Robinia pseudacacia, was introduced into Europe, in the Jardin du Roi at Paris in 1636. This tree, the bastard acacia, or false acacia, and often called erroneously acacia, is now widely cultivated as an ornamental tree in this country and on the European continent. It grows from 30 to 60 ft. high, and bears long, graceful, compound leaves with 9 to 17 bright green oblong leaflets, and white fragrant flowers in loose pendulous racemes. It is hardy in habit. There are many varieties in English gardens varying in the method of growth, the presence or absence of thorns (persistent spine-like stipules) on the branches and the colour of the flower.

In the eastern United States, where it is native, it grows from 70 to 80 ft. high with a trunk 3 or 4 ft. in diameter. It is one of the most valuable timber trees of the American forest. The wood is heavy, very hard, strong, close-grained and durable, and is extensively used in shipbuilding, also for posts and other purposes where durability in contact with the ground is essential.

Like many plants of the same family, the leaves show slow movement, folding together at night and in dull or wet weather; for this reason it is less injurious than many trees to plants growing in its shade, as the rain is able more quickly to reach the ground beneath.

[Note: The text continues but is not fully transcribed/analyzed.]
ROBINS, BENJAMIN (1707-1751). English man of science and engineer, was born at Bath in 1707. His parents were Quakers in poor circumstances, and gave him very little education. Having come to London by the advice of Dr Henry Pemberton (1694-1771), who had recognized his talents, he for a time maintained himself by teaching mathematics, but soon devoted himself to engineering and the study of fortification. In particular he carried out an extensive series of experiments in gunnery, embodying his results in his famous treatise on New Principles in Gunnery (1742), which contains a description of his ballistic pendulum (see CHRONOGRAPH). Robins also made a number of important experiments on the resistance of the air to the motion of projectiles, and on the force of gunpowder, with computation of the velocities thereby communicated to projectiles. He compared the results of his theory with experimental determinations of the ranges of mortars and cannon, and gave practical maxims for the management of artillery. He also made observations on the flight of rockets, and wrote on the advantages of rifled barrels. His work on gunnery was translated into German by L. Euler, who added to it a critical commentary, signed by his own name. Of less interest nowadays are Robins's more purely mathematical writings, such as his Discourse concerning the Nature and Certainty of Sir Isaac Newton's Methods of Fluxions and of Prime and Ultimate Ratios (1735), “A Demonstration of the Eleventh Proposition of Sir Isaac Newton's Treatise of Quadratures” (Phil. Trans., 1727), and similar works. Besides his scientific labours Robins took an active part in politics. He wrote pamphlets in support of the opposition to Sir Robert Walpole, and was secretary of a committee appointed by the House of Commons to inquire into the conduct of that minister. He also wrote a preface to the Report on the Proceedings of the Board of General Officers on their Examination into the Conduct of Lieutenant-General Sir John Cope, in which he gave an apology for the battle of Prestonpans. In 1749 he was appointed engineer-general to the East India Company, and went out to superintend the reconstruction of their forts; but his health soon failed, and he died at Fort St David on the 29th of July 1751.[1]

His works were published in two volumes in 1761.

ROBINSON, EDWARD (1704-1863), American Biblical scholar, was born in Southington, Connecticut, on the 10th of April 1794, the son of William Robinson (1754-1825), minister of the Congregational Church of Southington. He graduated in 1816 at Hamilton College. In 1821 he came under the influence and teaching of Moses Stuart, the second edition of whose Hebrew Grammar he helped to prepare for the press in 1823, and through whom he was appointed in the same year instructor in Hebrew in Andover Seminary. With Stuart he translated in 1825 the first edition of Winer's Grammar of New Testament Greek; and alone he translated Wahli's Clavis Philologica Nova Testamenti (1825). In 1826-30 he studied in Germany, especially at Halle, under Gesenius, Tholuck and Rödiger, and at Berlin, under Neander. He was professor (extraordinary) of sacred literature and librarian at Andover in 1830-33, resigning because of dangerous epileptic attacks; and in 1831-35 he edited the Biblical Repository, which he founded and carried on very largely by his own contributions. Assisted somewhat by his young German wife, Theresa Albertina Luise (1797-1869), the daughter of Professor Ludwig Heinrich von Jakob of Halle, a linguist of considerable ability, and a writer (in her early years under the pseudonym "Talvi") of essays and stories. In 1837 he accepted the professorship of Biblical literature in Union Theological Seminary, and left America for three years of study in Palestine and Germany, the fruit of which, his Biblical Researches, published in 1841, brought him the gold medal of the Royal Geographical Society in 1842. A second volume of Researches appeared in 1856. His plans to sum up his important topographical studies in a work on Biblical geography were cut short by cataract in 1861 and by his death in New York City on the 27th of January 1865. A great Biblical scholar and exegete, Robinson be considered the pioneer and father of Biblical geography—his Biblical Researches, supplemented by the Physical Geography of the Holy Land (1863), were based on personal exploration and tempered by a thoroughly critical spirit, which was possibly at times too sceptical of local tradition. Of scarcely less value in their day were his Greek Harmony of the Gospels (1843 and often) and his Greek and English Lexicon of the New Testament (1836; revised 1847 and 1856). He established in 1843 and edited for some years the Bibliotheca Sacra (in which the Biblical Repository was merged in 1852), for which he wrote until 1855.[2]

See Henry B. Smith and Roswell D. Hitchcock, The Life, Writings and Character of Edward Robinson (New York, 1863); a biography of Mrs Robinson was published, with a collection of her stories, in 1874.

ROBINSON, HENRY CRABB (1777-1867), English journalist and diarist, the son of a tanner, was born at Bury St Edmunds on the 13th of March 1775. In 1796 he entered the office of a solicitor in London, but two years later, having inherited a sum of money sufficient to give him a small yearly income, he started in 1800 upon a tour on the Continent, travelling chiefly in Germany and Bohemia. In 1802 he became a student at the university of Jena, where he remained until his return to England in 1805. After vain endeavours to obtain a post in the diplomatic service, he was appointed foreign correspondent for The Times at Altona. His letters, “From the Banks of the Elbe,” were published in this newspaper during 1807, and on his return he became its foreign editor. In 1808 at the outbreak of the Peninsula War he was sent out as special war correspondent—an innovation in English journalism—for The Times to Spain. There he witnessed Sir John Moore's retreat at Corunna. After his return to England he read for the bar at the Middle Temple, and from 1813 to 1818 he practised as a barrister, beginning as soon as he had acquired a modest competence. He is remembered chiefly as the friend of Lamb, Coleridge, Wordsworth and Southey. He was a great conversationalist, and his breakfast parties rivalled those of Samuel Rogers. He died in London on the 5th of February 1867.

His Diary of 35 volumes, his Journals of 30 volumes, and his Letters and Reminiscences in 36 volumes, contain vivid pictures drawn by an acute and sympathetic observer who had exceptional opportunities of studying contemporary celebrities. They are preserved at Dr Williams’s Library in Gordon Square, London. Crabb Robinson seems to have intended to edit these for publication, but except for a meagre selection edited by Thomas Sadler and entitled, Crabb Robinson's Reminiscences and Correspondence of H. Crabb Robinson (1866), they have never been republished. Crabb Robinson was one of the founders of the Athenaeum Club and of University College, London.

ROBINSON, JOHN (1650-1723), English diplomatist and prelate, a son of John Robinson (d. 1651), was born at Cleasby, near Darlington, on the 7th of November 1650. Educated at Brasenose College, Oxford, he became a fellow of Oriel College, and about 1680 chaplain to the British embassy to Stockholm, and remained in Sweden for nearly thirty years. During the absence of the minister, Philip Warwick, Robinson acted as resident and as envoy extraordinary, and he was thus in Sweden during all the interesting events of that period. Resuming his diplomatic duties at a time when the affairs of northern Europe were attracting an unusual amount of attention. Among his adventures not the least noteworthy was his journey to Narva with Charles XII. in 1700. In 1709 Robinson returned to England, and was appointed dean of Windsor and of Wolverhampton; in 1710 he was elected bishop of Bristol, and among other ecclesiastical positions he held that of dean of the Chapel Royal. In August 1711 he became lord privy seal, this being, says Lord Stanhope, “the last time that a bishop has been called upon to fill a political office.” In 1712 the bishop represented England at the important congress of Utrecht, and at first plenipotentiary he signed the treaty of Utrecht in April 1713. Just after his return to England he was chosen bishop of London in succession to Henry Compton. He died at Hampstead on the 11th of April 1723, having been a greatbenefactor to Oriel College. Robinson wrote an Account of Sweden:
ROBINSON, J.—ROBINSON, MARY 423

together with an Extract of the History of that Kingdom. By a
person of note who resided many years there (London, 1605).
This was translated into French (Amsterdam, 1712), and in
1738 was published with Viscount Molesworth's Account of
Denmark in 1692. Some of his letters are among the Strafford
papers in the British Museum.
A member of the same family was Sir Frederick Philipse
Robinson (1675–1852), a Virginia soldier, who fought for
England during the American War of Independence. On
the conclusion of peace he went to England, and in 1813 and 1814
he commanded a brigade under Wellington in Spain. After-
wards he was governor of Tobago, and he became a general in
1841. He died at Brighton on the 1st of January 1852.

ROBINSON, JOHN (1575–1625), English Nonconformist
divine, was born probably in Lincolnshire or Nottingham-
shire about 1575. He seems to have studied at Cambridge,
and to have been influenced by William Perkins. He took
orders and held a curacy in Norwich, but was attracted
by Puritan doctrines, and finally associated himself with a Congre-
gation meeting at Gainsborough (where the "John Robinson
Memorial Church" stands where his work is housed). In 1606 the
members divided into two societies, Robinson becoming
minister of the one which made its headquarters at Scrooby,
a neighbouring village. The increasing hostility of the authori-
ties towards nonconformity soon forced him and his people
to think of flight, and, not without difficulty, they succeeded
in making their escape in detachments to Holland. Robinson
settled in Amsterdam in 1608, but in the following year re-
moved, with a large contingent, to Leiden, where he ministered
to a community whose numbers gradually grew from one hundred to three hundred. In 1620 a considerable number of these sailed for England in the "Speedwell," and ultimately crossed the Atlantic in the "Mayflower"; it was Robinson's intention to follow as soon as practicable, along with the rest of his flock, but he died before the plan could be carried out, on the 1st of March 1625.

In the early stages of the Arminian controversy he took
the Calvinistic side, and even engaged in a public disputation
with the famous Episcopists. He bore a high reputation even among his ecclesiastical opponents, and one of them (Robert Baillie) calls him "the most learned, polished and modest spirit that ever that sect enjoyed." He was large-minded and eminently reasonable in spirit, recognizing parish assemblies where "the pure word and discipline" prevailed as true churches of God. His sound judgment is seen in the way in which he adjusted the relations of elders and church— the most delicate practical problem of Congregationalism.

Amongst his publications may be mentioned Justification of
Separation from the Church (1610), Apologia Brownistarum (1610),
A Defence of the Doctrine professed by the Synod of Dort (1623),
and a volume of Essays, or Observations Divine and Moral, printed
in 1625. His Works (with one exception, A Manumission to a
Mandation, since published by the Massachusetts Historical Society, ser. iv., vol. iv.) includes a memoir, written by R. Ashton in three volumes in 1851. A summary of their contents is given in C. Puchard, History of Congregationalism (New York, 1867), iii. 300–344. See further Congregationalism, and the literature there cited; also O. S. Davis, John Robinson (Hartford, Connecticut, 1897).

ROBINSON, SIR JOHN BEVERLEY, BART. (1701–1863),
Canadian statesman and jurist, was the son of Christopher
Robinson (1764–1798), one of the band known as United
Empire Loyalists, who came to Canada at the conclusion of
the American Revolution. He was born at Berthier, Quebec,
on the 26th of July 1701, and studied under Dr John
Strachan, by whom his religious and political ideas were much
influenced. He served with distinction at the beginning of the
war of 1812, and later in the war was appointed acting
attorney-general of Upper Canada. In 1815 he visited England
and read law at Lincoln's Inn.

From 1818 till 1829 he was the head of the Tory party in
Upper Canada (the so-called "Family Compact"). In 1829
he became chief justice of Upper Canada, which position he
held till shortly before his death on the 31st of January 1863.

Not one of his decisions was ever reversed on appeal. In
1824 and again in 1830 he strongly advocated a federal union
of British North America, and in 1830 opposed in Canada and
the Canada Bill the legislative union of the two Canadas pro-
posed by Lord Durham. In 1834 he was created a baronet of
the United Kingdom and in 1855 a D.C.L. of Oxford Uni-
versity. His unbending Toryism rendered him a reactionary
in politics, but his bitterest opponents admitted his sincerity
and patriotism.

Several of his sons rose to eminence, John Beverley Robinson
(1820–1866) becoming a member of the Dominion parliament
and lieutenant-governor of Ontario (1880–1887). Christopher
Robinson (1828–1905) was for many years the acknowledged
leader of the Canadian Bar.

His Life, by his son, Major-General C. W. Robinson, C.B. (Toronto
and London, 1904), gives a very favourable picture of the fine old
colonial gentleman and loyalist. For a less favourable view see

ROBINSON, JOHN THOMAS ROMNEY (1792–1882), Irish
astronomer and physicist, was born in Dublin on the 23rd of
April 1792. He studied at Trinity College, Dublin, and ob-
tained a fellowship in 1814; for some years he was deputy
professor of natural philosophy, until in 1821 he obtained the
college living of Enniskillen. In 1823 he was appointed astro-
nomer of the Armagh observatory, with which he (from 1824)
combined the living of Carrickmacross, but he always resided
at the observatory, engaged in researches connected with
astronomy and physics, until his death on the 28th of February
1882.

Robinson published a number of papers in scientific journals,
and a catalogue of stars observed at the Armagh observatory
(Plates of 5345 Stars observed from 1828 to 1854 at the Armagh
Observatory, Dublin, 1859), but he is best known as the inventor (1846) of the cup-anemometer for
registering the velocity of the wind.

ROBINSON, SIR JOSEPH BENJAMIN (1845–1908), South
African mine-owner, was born at Craddock, Cape Colony, in
1845. At the age of sixteen he started business as a general
trader, wool-buyer and stock-breeder, but on the discovery of
diamonds in South Africa in 1867 he hastened to the Vaal
river district where, by purchasing the stones from the natives
and afterwards by buying diamond-bearing land, notably
at Kimberley, he soon acquired a considerable fortune. He
was mayor of Kimberley in 1880, and for four years was a
representative of Griqualand West in the Cape parliament.
On the discovery of gold in the Witwatersrand district in 1886,
Robinson purchased the Langlaagte and Randfontein estates.
His views as to the westerly trend of the main gold-bearing reef
were entirely contrary to the bulk of South African opinion
at the time, but events proved him to be correct, and the
enormous appreciation in value of his various properties made
him one of the richest men in South Africa. As a Rand capi-
talist he stood aloof from combinations with other gold-mining
interests, and took no part in the Johannesburg reform move-
ment, maintaining friendly relations with President Kruger.
He claimed that it was as the result of his representations after
the Jameson Raid that Kruger appointed the Industrial Com-
mision of 1897, whose recommendations—had they been
acted upon—would have remedied many of the ills of the
lost isle. His later years were spent in peace and
The Winter's Tale, and her beauty so captivated George, prince of Wales (afterwards
George IV.), then in his eighteenth year, that he began a correspondence with her, signing himself "Florizel." She was for about two years his mistress, but he then deserted her, even dishonouring his bond for £20,000, payable when he came of age, and left her to obtain a pension of £500 in exchange for it from Charles James Fox. Owing to the hostility of public opinion, she feared to return to the stage, but she published some more volumes of her writings. There are numerous charming portraits of "Perdita"; two in the Wallace Collection, by Reynolds and by Gainsborough, reveal "her grave, refined beauty." Hoppner, Cosway and Romney also painted her.

ROBINSON, THEODORE (1852-1896), American artist, was born at Irasburg, Vermont, in 1852. He was a pupil of J. L. Gérôme and Carolus-Duran in Paris, and worked with Claude Monet. He received the Webb Prize in 1890 for his "Winter Landscape," and the Shaw Fund in 1892 for his "In the Sun," a study of a peasant girl. He became a member (1881) of the Society of American Artists. He died in New York City on the 2nd of April 1896.

ROBERT (1671-1734), the popular designation of a famous Highland outlaw whose prowess is the theme of one of Sir Walter Scott's novels, was by descent a Macgregor, being the younger son of Donald Macgregor of Glengyle, lieutenant-colonel in the army of James II., by his wife, a daughter of William Campbell of Glenieves. He received the name Roy from his red hair, and latterly adopted Campbell as his surname on account of the acts proscribing the name of his clan. Though in stature not much above the middle height, he was so muscular and thickset that few were his equals in feats of strength, while the unusual length of his arms gave him an extraordinary advantage in the use of the sword. His eyes were remarkably keen and piercing, and with his whole expression formed an appropriate complement to his powerful physical frame. He inherited a small property on the Braes of Balquhidder, and at first devoted himself to the rearing of cattle. Having formed a band of armed clansmen, he obtained, after the accession of William III., a commission from James II. to levy war on all who refused to acknowledge him as king, and in the autumn of 1691 made a descent on Stirlingshire to carry off the cattle of Lord Livingstone, when, being opposed by the villagers of Kippen, he also seized the cattle from all the byres of the village. Shortly afterwards he married Helen Mary, daughter of Macgregor of Comar. On the death of Gregor Macgregor, the chief of the clan, in 1693 he managed, though not the nearest heir, to get himself acknowledged chief, obtaining control of the lands stretching from the Braes of Balquhidder to the shores of Loch Lomond, and situated between the possessions of Argyll and those of Montrose. To assist in carrying on his trade as cattle-dealer he borrowed money from the 1st duke of Montrose, and, being unable to repay it, he was in 1712 evicted from his property and declared an outlaw. Taking refuge in the more inaccessible Highlands, Rob Roy from this time forward supported himself chiefly by depredations committed in the most daring manner on the duke and his tenants, all attempts to capture him being unsuccessful. During the rebellion of 1715, though nominally siding with the Pretender, he did not take an active part in the battle of Sheriffmuir except in plundering the dead on both sides. He was included in the Act of Attainder; but, having for some time enjoyed the friendship of the duke of Argyll, he obtained, on making his submission at Inversnaid, a promise of protection. He now established his residence at Craigroyston, near Loch Lomond, whence for some time he levied blackmail as formerly upon Montrose, escaping by his wonderful address and activity every effort of the English garrison stationed at Inversnaid to bring him to justice. Ultimately, through the mediation of Argyll, he was reconciled to Montrose, and in 1722 he made submission to General Wade; he was carried off, and imprisoned in Newgate, and in 1727 was pardoned just as he was to be transported to Barbados. He then returned to Scotland.

According to a notice in the Caledonian Mercury he died at Balquhidder on the 28th of December 1734. He was buried in Balquhidder churchyard.

The best lives are K. Macleay, Historical Memoirs of Rob Roy (1818; new ed., 1881); A. H. Miller, Story of Rob Roy (1883). See also Sir W. Scott's introduction to the novel Rob Roy. An early account, The Highland Rogue, &c. (1723), is ascribed to Deole.

ROBSART, the maiden name of LADY AMY DUDLEY (1532-1560), wife of Lord Robert Dudley, afterwards earl of Leicester. She was the daughter of Sir John Robsart of Norfolk, and was married to Lord Robert on the 4th of June 1530. The marriage was apparently arranged by the family for business reasons, and there is no ground for supposing that it was a love match, or that she was beautiful. Her attraction lay in her estate, which was a provision for a younger son. During the early years of the marriage her husband was entangled in the rebellion of his family against Queen Mary, and was imprisoned in the Tower. She visited him there, and acted for his interests. After his release she saw little of him. When Elizabeth became queen in 1559 Lord Robert was soon known to be her favourite, and it was believed that she would marry him if she were free. His wife never came to court and was never in his company. Stories were set about to the effect that she was suffering from cancer and would soon die. Quadra, the Spanish ambassador, reported to the king of Spain that the queen had repeated this rumour to him. In 1560 she went by her husband's directions to Cumnor Place, a house near Oxford, rented by his agent Anthony Forster or Forrester, member of parliament for Abingdon. Here she was found lying dead on the floor of the hall on the 8th of September 1560 by her servants, whom she had allowed to go to Abingdon. Fair. The circumstances of her death never have been, and now cannot be cleared up. A coroner's jury, which her husband, did his best to pack and influence, attributed her end to accident. There is no evidence against Dudley, unless it be evidence that he was a most unscrupulous man, and that he was generally believed to have murdered several other persons who stood in his way.

ROBSON, W. (1836-1903), American actor, whose real name was Robson Stuart, was born in Annapolis, Maryland, on the 4th of March 1836. An unintentionally humorous appearance in a serious part in 1852 showed him that his forte was comedy; and in partnership with W. H. Crane from 1877 to 1889 he was very successful as a comedian, The Henrietta being one of their best productions. He died on the 20th of April 1903. His wife, May Robson, also became well known as an actress.

ROBY, HENRY JOHN (1830- ), English classical scholar and writer on Roman law, was born at Tamworth on the 12th of August 1830. He was educated at St John's College, Cambridge (senior classic; 1853; fellow, 1854). From 1866 to 1868 he was professor of jurisprudence at University College, London, and from 1872 to 1874 commissioner of endowed schools. From 1890 to 1893 he was member of parliament for the Liberal interest for the Eccles division of Lancashire. The book by which he is perhaps best known is his Grammar of the Latin Language from Plautus to Suetonius, a storehouse of illustrative quotations from Latin literature, but his most important works deal with Roman law—Introduction to Justinian's Digest (1884) and Roman Private Law (1902).

ROC, or more correctly RUKH, a fabulous bird of enormous size which carries off elephants to feed its young. The legend of the roc, familiar to every one from the Arabian Nights, was widely spread in the East; and in later times the home of the monster was sought in the direction of Madagascar, where gigantic fronds of the Raphia palm very like a quill in form appear to have been brought under the name of roc's feathers (see Yule's Marco Polo, bk. ii. ch. 33, and Academy, 1884, No. 620). Such a feather was brought to the Great Khan, and we read also of a gigantic stump of a roc's quill being
brought to Spain by a merchant from the China seas (Abu Ḥamīd of Spain, in Damrī, s.s.). The roe is happily different from the Arabic 'ānkā (see Phoenix); it is also identified with the Persian simurgh, the bird which figures in Firdausi's epic as the foster-father of the hero Zal, father of Rustam. When we go farther back into Persian antiquity we find an immortal bird, amru, or (in the Minūs-khirād) sinamrā, which shakes the ripe fruit from the mythical tree that bears the seed of all useful things. Sinamrū and simurgh seem to be the same word. In Indian legend the garuda on which Vishnu rides is the king of birds (Benfey, Panteschatana, iii. 98). In the Pahlavi translation of the Indian story as represented by the Syrian Kalīlag and Dimma (ed. Bickell, 1876), the simurgh takes the place of the garuda, while Ibn al-Mokaffa' (Cailla et Dimma, ed. De Sacy, p. 126) speaks instead of the 'ānkā. The later Syriac, curiously enough, has behemoth,—apparently the behemoth of Job transformed into a bird.

For a collection of legends about the roc, see Lane's Arabian Nights, chap. xx. notes 22, 62, and Yule, ut supra. Also see Bochart, Heres, bk. vi. ch. xiv.; Damiri, i. 414, ii. 177 seq.; Kazwinī, i. 419 seq.; Ibn Batūta, iv. 395 seq.; Spiegel, Eran. Altertumsk. li. 118.

ROCAMADOUR, a village of south-western France, in the department of Lot, 36 m. N.N.E. of Cahors by road. Pop. (1906) 296. Rocamadour, a famous place of pilgrimage, is most strikingly situated. Its buildings rise in stages up the side of a cliff on the right bank of the Alzou, which here runs between rocky walls 400 ft. in height. Flights of steps ascend from the lower town to the churches—a group of massive buildings half-way up the cliff. The chief of them is the church of Notre-Dame (1479), containing the wooden figure of the Madonna reputed to have been carved by St Amadour. The church opens on to a terrace called the Plateau de St Michel, where there is a broken sword said to be a fragment of "Dorandal," once wielded by the hero Roland. The interior walls of the church of St Sauveur are covered with paintings and inscriptions recalling the pilgrimages of celebrated persons. The subterranean church of St Amadour (1166) extends beneath St Sauveur and contains relics of the saint. On the summit of the cliff stands the château built in the middle ages to defend the sanctuaries.

Rocamadour owes its origin to St Amadour or Amatour, who, according to tradition, chose the place as a hermitage for his devotions to the Virgin Mary. The saint is identified with Zachaeus the publican and disciple of Jesus, who is said to have journeyed to Gaul to preach the gospel. The renown of Rocamadour as a place of pilgrimage dates from the early middle ages.

ROCAMBOLE, Allium scorodoprasum, a hardy bulbous perennial occurring in a wild state in sandy pastures and waste places throughout Europe, but not common in the south; in Britain it is rare, and found in the north of England and the south of Scotland. Its cultivation does not appear to be of ancient date; it is not mentioned by Greek and Roman authors, and there are only a small number of original common names among ancient peoples (A. de Candolle, Origin of Cultivated Plants, p. 72). The plant is grown for its bulbs, which are smaller and milder than those of garlic, and consist of several cloves chiefly produced at the roots. The cloves are planted about the end of February or in March, and treated like garlic or shallots. When mature, the bulbs are taken up, dried and stored for use.

ROCH, ST (Lat. Rochus; Ital. Rocco; Span. Roque; Fr. Roch) (d. 1327), a confessor whose death is commemorated on the 16th of August; he is specially invoked against the plague. According to his Acta, he was born at Montpellier, France, about 1295. He early began to manifest strict asceticism and great devoutness, and on the death of his parents in his twentieth year he gave all his substance to the poor. Coming to Italy during an epidemic of plague, he was very diligent in tending the sick in the public hospitals at Aquapendente, Cesena and Rome, and effected many miraculous cures by prayer and simple means. After similar ministries at Piacenza he himself fell ill. He was expelled from the town, and withdrew into the forest, where he would lie half-way there, to the door of a dog belonging to a nobleman named Gothardus supplied him with bread. On his return to Montpellier he was arrested as a spy and thrown into prison, where he died on the 16th of August 1327, having previously obtained from God this favour—that all plague-stricken persons invoking him should be healed. His cult spread through Spain, France, Germany, Belgium and Italy. A magnificent temple was raised to him at Venice, where his body is believed to lie, and numerous brotherhoods have been instituted in his honour. He is usually represented in the garb of a pilgrim, with a wound in his thigh, and with a dog near him carrying a loaf in its mouth.

See Acta sanctorum, August. iii. 380-415; Charles Cahier Les Caractéristiques des saints (Paris, 1867), pp. 215-217. (H. De)

ROCHAMBEAU, JEAN BAPTISTE DONATIEN DE VIMEUR, COMTE DE (1725-1807), French soldier, was born at Vendôme (Loir-et-Cher) on the 1st of July 1725. He was originally destined for the church and was brought up at the Jesuit college at Blois, but after the death of his elder brother he entered the cavalry regiment, served in Bohemia and Bavaria and on the Rhine, and was promoted to colonel. He took part in the siege of Maestricht in 1748, became governor of Vendôme in 1749, and after distinguishing himself in 1756 in the Minorca expedition was promoted brigadier of infantry. In 1757 and 1758 he fought in Germany, notably at Crefeld, receiving several wounds in the battle of Clostercamp (1760), was appointed maréchal de camp in 1761 and inspector of cavalry and was frequently consulted by the ministers on technical points. In 1780 he was sent, with the rank of lieutenant-general, in command of 6000 French troops to help the American colonists under Washington against the English. He landed at Newport, Rhode Island, on the 10th of July, but was held here inactive for a year, owing to his reluctance to abandon the French fleet, which was blockaded by the British in Narragansett Bay. At last, in July 1781, Rochambeau's force was able to leave Rhode Island and, marching across Connecticut, joined Washington on the Hudson. Then followed the celebrated march of the combined forces to Yorktown, where on the 22nd of September they formed a junction with the American army; this was followed by Rochambeau's decision to surrender on the 19th of October. Throughout, Rochambeau had displayed an admirable spirit, placing himself entirely under Washington's command and handling his troops as part of the American army. In recognition of his services, Congress voted him and his troops the thanks of the nation and presented him with two cannon taken from the English. These guns, which Rochambeau took back to Vendôme, were requisitioned in 1792. On his return to France he was loaded with favours by Louis XVI. and was made governor of Picardy. During the Revolution he commanded the Army of the North in 1790, but resigned in 1792. He was arrested during the Terror, and narrowly escaped the guillotine. He was subsequently pensioned by Bonaparte, and died at Thoré (Loir-et-Cher) on the 10th of May 1807.

A statue of Rochambeau by Ferdinand Hamburger, the gift of France to the United States, was unveiled in Lafayette Square, Washington, by President Roosevelt on the 24th of May 1902. The ceremony was made the occasion of a great demonstration of friendship between the two nations. France was represented by her ambassador, M. Canrobert, and General Brugère, a detachment of sailors and marines from the warship "Gaulois" being present. Representatives of the Lafayette and Rochambeau families also attended. Of the many speeches perhaps the most striking was that of Senator Henry C. Lodge, who, curiously enough in the circumstances, prefaced his eloquent appreciation of the services rendered to the American cause by France by a brilliant sketch of the way in which the French had been driven out of North America by England and her colonists combined. General Brugère, in his speech, quoted Rochambeau's words, uttered in 1781: "Entre vous,
entre nous, à la vie, à la mort." A “Rochambeau fête” was held simultaneously in Paris.

ROCHDALE, a municipal, county and parliamentary borough of Lancashire, England, on the river Roch, 103 m. N.N.E. from Manchester and 196 m. N.W. from London, on the Lancashire & Yorkshire railway. Pop. (1891) 76,101; (1901) 83,314. By means of the Rochdale canal and connections it has water communications in every direction. The site rises sharply from the Roch, near its confluence with the Spodden, and from the high-lying public park of Rochdale fine views of the picturesque neighbourhood are obtained. Several interesting old houses remain in the vicinity of the town. The parish church of St Chad is built on the site of a church erected in the 12th century, but itself retains no portion earlier than the Perpendicular period. In the churchyard is buried John Collier (1708-1786), a local author, artist and caricaturist. He was among the first to recognize and utilise in writing his humour in the popular press considerable fame under the pseudonym of Tim Bobbin. The town hall is an extensive and elaborate structure in the Decorated style, with a tower. Of educational charities the principal is the Archbishop Parker free grammar school, founded in 1565. There are also technical and art schools; and a large Roman Catholic orphanage. Among other public institutions are the public library, the infirmary, the literary and scientific society and the art society. Rochdale was the birthplace of the co-operative movement. The Equitable Pioneers Society (1844) numbers over 11,000 members, with a capital of over £350,000. A handsome co-operative store, belonging to the Rochdale Provident Co-operative Society, was opened in 1900. A statue of John Bright (1851) recalls the connexion of the statesman and his family with Rochdale. The staple manufactures are those of woollens and cottons. There are, besides, foundries, iron-works and machine-factories. Coal and stone are obtained extensively in the neighbourhood. Frequent cattle and horse fairs are held. Rochdale was incorporated in 1832 and includes several townships. The corporation consists of a mayor, 10 aldermen and 30 councilors. The county borough was created in 1888. The parliamentary borough, which has returned one member since 1832, falls between the Middleton and Heywood divisions of the county. Area of municipal borough, 6446 acres.

Rochdale (Rechedam, Rachedam, Rachadal) takes its name from the river on which it stands. A Roman road passed the site, and a Saxon castle stood in Castleton, one of the component parts of the town. In Edward the Confessor’s reign most of the land was held by Ganel the Thane, but after the Conquest the manor probably came into the hands of Roger de Poictou, from whom it passed to the Lacy family and their other lands became merged in the duchy of Lancaster. From 1462 to 1625 the crown seems to have leased it to the Byron family. In 1625 Charles I. conveyed the manor in trust for the earl of Holderness, and in 1668 it was sold to Sir John Byron, afterwards Baron Byron of Rochdale, whose descendants held it till 1823 when it was sold to the Deardens. Manor courts are still held periodically. Henry III. in 1210 granted to Edmund de Lacy the right to hold a weekly market on Wednesday and an annual fair on the feast of SS Simon and Jude (28th October). Early in George III.’s reign the market day was changed to Monday. Two of the early industries, cutlery and hat-making, date from about the middle of the 16th century. The woolen industry is generally, but erroneously, said to have been introduced by Flemish immigrants in Edward III.’s reign; but, by the cognate trades of dyeing and fulling, its importance only dates from the early part of the 17th century. It was not till 1795 that a cotton mill was built here, and in the latter half of the 18th century the town was famed for its woollen, not its cotton manufactures.

See H. Fishwick, History of the Parish of Rochdale (1889).

ROCHE, SIR BOYLE, BART. (1743-1827), Irish soldier and politician, famous for his “bulls,” came of a branch of the family of the Viscounts Fermoy. He served in the American War, and sat in the Irish parliament from 1777 onwards, being created a baronet in 1782 for his loyalty to the government. He supported the Union, and one of his recorded “bulls”—many, however, being only fastened on him—was his declaration that he would have “the two sisters” (England and Ireland) “embrace like one brother.” Sir Boyle Roche was a characteristically witty and genial Irishman, and was master of the ceremonies at Dublin Castle.

ROCHEFORT, HENRI, MARQUIS DE ROCHEFORT-LUCAY (1830–), French politician, was born in Paris on the 30th of January 1830. His father was a Legitimist nobleman who as “Edmond Rochefort” was well known as a writer of vaude- viles; his mother’s views were republican. After experience as a medical student, a clerk at the Hôtel de Ville, a playwright and a journalist, he joined the staff of the Figaro in 1853, but a series of his articles, afterwards published as Les Échos des dix-sept ans (5 vols., 1866-68), brought the paper into collision with the authorities, and marked the termination of his engagement. In collaboration with different dramatists he had meanwhile written a long series of successful vaudevilles, which began with the Monseur bien mis at the Folies Dramatiques in 1856. On leaving the Figaro Rochefort determined to start a paper of his own, La Lanterne. The paper was seized on its eleventh appearance, and in August 1868 Rochefort was fined 10,000 francs, with a year’s imprisonment. He then published his paper in Brussels, whence it was smuggled into France. Printed in French, English, Spanish, Italian and German, it went the round of Europe. After a second prosecution he fled to Belgium. A series of duels, of which the most famous was one fought with Paul de Cassagnac a propos of an article on Joan of Arc, kept Rochefort in the public eye. In 1869, after two unsuccessful candidatures, he was returned to the Chamber of Deputies by the first circonscription of Paris. He was arrested on the frontier, only to be almost immediately released, and forthwith took his seat. He renewed his onslaught on the empire, starting a new paper, the Mars, and held a series of political meetings by himself at La Villette. The staff was arrested on the votes of the members, and included Victor Noir and Pascal Grousset. The violent articles in this paper led to the duel which resulted in Victor Noir’s death at the hands of Prince Pierre Bonaparte. The paper was seized, and Rochefort and Grousset were sent to prison for six months. The revolution of September was the signal for his release. He became a member of the government of National Defence, but this short association with the forces of law and order was soon broken on account of his openly expressed sympathy with the Communards. On the 11th of May 1871 he fled in disguise from Paris. A week earlier he had resigned with a handful of other deputies from the National Assembly rather than countenance the dismembrment of France. Arrested at Meaux by the Versailles government, he was detained for some time in prison with a nervous illness before he was condemned under military law to imprisonment for life. In spite of Victor Hugo’s efforts on his behalf he was transported to New Caledonia. In 1874 he escaped on board an American vessel to San Francisco. He lived in London and Geneva until the general amnesty permitted his return to France in 1880. In Geneva he resumed the publication of La Lanterne, and in the Parisian papers articles constantly appeared from his pen. When at length in 1880 the general amnesty
permitted his return to Paris he founded L'Intransigent in the Radical and Socialist interest. For a short time in 1885-86 he sat in the Chamber of Deputies, but found a great opportunity next year for his talent for inflaming public opinion in the Boulangist agitation. He was condemned to detention in a fortress in August 1889 at the same time as General Boulanger, whom he had followed into exile. He continued his polemic from London, and after the suicide of General Boulanger he attacked M. Consta, minister of the interior in the Freycinet cabinet, with the utmost violence, in a series of articles which led to an interpellation in the chamber in circumstances of wild excitement and disorder. The Panama scandals furnished him with another occasion, and he created something of a sensation by a statement in the Figaro that he had met M. Clemenceau at the table of the financier Cornélius Herz. In 1895 he returned to Paris, two years before the Dreyfus affair supplied him with another point d'appui. He became a leader of the anti-Dreyfusards, and had a principal share in the organization of the press campaign. Subsequently he was editor of La Patrie.

Besides his plays and articles in the journals he published several separate works, among them being: Les Petits Mystères de l'Hôtel des Ventes (Geneva, 1882); Les Naufrageurs (1876); L'Éboué (1883), Napoléon dernier (3 vols., 1884); and Les Aventures de ma vie (5 vols., 1896).

ROCHEFORT, a small town of Belgium, situated on the Loume, a tributary of the Lesse, in the S.E. of the province of Namur close to the Ardenne. Resident pop. (1904) 3068, which in July and August is doubled. It is of ancient origin, its position at the point where the route to St Hubert crossed that from Liège to Bouillon having made it at all times a place of some importance. The ruins of the old castle, which gave the place its name and a title to a long line of counts who had the right of coining their own money, still exist. This castle underwent many sieges and suffered much in the earlier wars, especially at the hands of Marshal de Châtillon in 1636. Rochefort is noted for its healthiness, and is a favourite place of residence. It also retains every summer a large number of visitors and tourists, who visit it on account of the remarkable statues and its neighboring grounds. One of these is situated in the town itself and is known by its name. This grand château consists of six halls or chambers, the largest of which is called the Sabat, and is remarkable for its great height. But the most famous are the grottoes of Han, situated three miles from Rochefort at Han sur Lesse. Here the river Lesse passes by a subterranean and undiscovered passage under the hill called Boëme or Boine. The endeavour to trace the course of the river led to the discovery of the grottoes, which consist of fifteen separate halls, connected by passages more or less short and emerging on the river in a dark and extensive cavern forming a sort of side creek or bay. Except in flood-time, when the exit has to be used, the entrance is near the point where the river disappears at what is called the gap or hole of Belvaux, and the exit is made by boat from the cavern last described, which leads out to the open river. A beautiful effect is afforded by the passage from the complete darkness of this cavern into the light. The finest stalactites are in the three halls called the Mysterieuses, the Vigioner and the Draperies. In the last-named is "the tomb," which looks as if chiselled out of white marble. The central hall —called the Salle d'Armes—is immense, and one of the river channels flows through it. Electric light has been introduced. Near Rochefort are the famous red marble quarries of St Remy, and the old Cistercian abbey of that name is now a Trappist seminary.

ROCHEFORT, a town of western France, capital of an arrondissement in the department of Charente-Inférieure, 20 m. S.S.E. of La Rochelle on the State railway from Nantes to Bordeaux. Pop. (1906) town, 31,433; commune, 36,604. It is situated on the right bank of the Charente, 9 m. from the Atlantic, and is built partly on the side of a rocky hill and partly on an old marshland. The town is laid out with great regularity, the streets being wide and straight and centring round the Place Colbert, in the middle of which is a monumental fountain of the 18th century. The public institutions of Rochefort comprise the sub-prefecture, tribunals of first instance and of commerce, a board of trade arbitration, a chamber of commerce, a lycée for boys, a college for girls and schools of drawing and architecture. The fortifications are slight. Below Rochefort the Charente is crossed by a pont transbordeur, the carrier of which is a height which admits of the tallest ships passing underneath at any time. There are both a naval and a commercial harbour. The former has the advantage of deep anchorage well protected by batteries at the mouth of the river, and the roadstead is perfectly safe. The windings of the channel, however, between Rochefort and the sea, and the bar at the entrance renders navigation dangerous. Rochefort is capital of the fourth maritime arrondissement, which stretches from the bay of Bourneuf to the coast of Spain. The naval harbour and arsenal, separated from the town by a line of fortifications with three gates, contain large covered building yards, repairing docks and extensive timber basins on both banks of the river. The arsenal has also a ropewalk from 1882; a school of navigation and pilotage, the offices of the maritime prefecture, a marine observatory, a park of artillery and various boards of direction connected with the navy. Other government establishments at Rochefort are barracks for infantry, artillery and marines, and the naval hospital and school of medicine. In the grounds of this last institution is an artesian well, sunk in 1862-66 to a depth of 3000 ft., and yielding water with a temperature of 100° F. The commercial harbour, higher up the river than the naval harbour, has two small basins, a third basin with an area of 15 acres and a depth at mean-tide of 25 ft., at spring-tide of 43 ft., and a dry dock 110 yds. long. Besides shipbuilding, which forms the staple industry, flour- and saw-milling, sailcloth, &c., are among the local manufactures. At the ports of Rochefort and Tonnay-Charente (4 m. higher up) there entered, in 1905, 265 vessels (166 British), with a tonnage of 192,537.

The lordship of Rochefort, held by powerful nobles as early as the 11th century, was united to the French Crown by Philip the Fair in 1339. In the 14th century it was alternately seized in the course of the Hundred Years' War by the English and the French, and in the Wars of Religion by the Catholics and Protestants. Colbert having in 1665 chosen Rochefort as the seat of a repairing port between Brest and the Gironde, the town rapidly increased in importance; by 1674 it had 20,000 inhabitants; and when the Dutch admiral Cornelius Tromp appeared at the mouth of the river with seventy-two vessels for the purpose of destroying the new arsenal, he found the approaches so well defended that he gave up his enterprise. It was at Rochefort that the naval school, afterwards transferred to Brest, was originally founded. The town continued to flourish in the later part of the 17th century. In 1690 and in 1709 the English made unsuccessful attempts to destroy it. Its fleet, under the command of Admiral de L'Oissinonne, a native of the place, defeated Admiral Byng in 1755 and did good service in the wars of the republic. But the destruction of the French fleet by the English in 1809 in the roadstead of Rochefort precluded the preference accorded to the harbours of Brest and Toulon and the unhealthiness of its climate seriously interfered with the prosperity of the place. The convict establishment, founded at Rochefort in 1777, was suppressed in 1872.

ROCHESTER, JOHN WILMOT, 2ND EARL OF (1647-1688), English poet and wit, was the son of Henry Wilmot, 1st earl. The family was descended from Edward Wilmot of Witney, Oxfordshire, whose son Charles (c. 1570-c. 1644), having served with distinction in Ireland during the rebellion at the beginning of the 17th century, was president of Connaught from 1616 until his death. In 1621 he had been created an Irish peer as Viscount Wilmot of Athlone, and he was succeeded by his only surviving son, Henry (c. 1612-1658). Having fought against the Scots at Newburn and been imprisoned and expelled from
the House of Commons for plotting in the interests of the king in 1641, Henry Wilmot served Charles I. well during the Civil War, being responsible for the defeats of Sir William Walker at Roundway Down in July 1643 and at Compton Bridge in June 1644. In 1643 he created Sir John Wilmot, 1st earl of Rochester, in broad terms with some of the king's friends and advisers, including Prince Rupert, and in 1644 he is reported to have said that Charles was afraid of peace and to have advised his suzerainty by his son, the prince of Wales. Consequently he was deprived of his command, and after a short imprisonment was allowed to cross over to France. He was greatly trusted by Charles II., whose defeat at Worcester and subsequent wanderings he shared, and during this king's exile he was one of his principal advisers, being created him earl of Rochester in 1652. In the interests of Charles he visited the emperor Ferdinand III., the duke of Lorraine, and the elector of Brandenburg, and in March 1655 he was in England, where he led a feeble attempt at a rising on Marston Moor, near York; on its failure he fled the country.

Born at Ditchele in Oxfordshire on the 30th June 1614, John Wilmot, who succeeded his father as 2nd earl in 1658, was educated at Wadham College, Oxford, and in 1661, although he was only fourteen years of age, received the degree of M.A. On leaving Oxford he travelled in France and Italy with a tutor who encouraged his love of literature, and moreover advocated principles of temperance which, however, bore little fruit. He returned in 1664, and no doubt admired his brother Charles's courtship of the king's youth, good looks and wit assured him of a welcome. In 1665 he joined the fleet serving against the Dutch as a volunteer, and in the following year distinguished himself by carrying a message in an open boat under fire. This reputation for courage was afterwards lost in private quarrels in which he seems to have shirked danger. He became gentleman of the bedchamber to Charles II., and was the confidant of his various exploits. According to Anthony Hamilton, banishment from court for lampooning the king or his mistresses was with Rochester an almost annual occurrence, but his disgrace was never of long duration. Charles seems to have found his company too congenial to be long dispensed with, and Pepys says that all serious men were disgusted by the complaisance with which he passed over Rochester's insolence (Diary, 17th Feb. 1668). In order to restore his rapidly vanishing fortune he became a suitor to Elizabeth Malet. In spite of the king's support of Rochester's suit, Miss Malet refused to marry the earl, who thereupon had her seized (1663) from her uncle's coach. Rochester was pursued, and Charles, who was very angry, sent him to the Tower. Miss Malet, however, married him in 1667.

Not content with making or unmaking the reputation of the maids of honour and the courtiers by his squibs and songs, Rochester aspired to be a patron of poetry and an arbiter of taste, but he was vain and capricious, tolerating no rivals in his capacity of patron. Dryden dedicated to him his Marriage-à-la-Mode (1672) in a preface full of effusive flattery, at the close of which, however, occurs a passage that may be taken to indicate that he already had misgivings. "Your lordship has but another step to make," he says, "and from the patron of wit, you may become its tyrant; and oppress our little reputations with more ease than you now protect them." Dryden had another patron in Lord Mulgrave (afterwards duke of Buckingham and Normanby), to whom he dedicated (1675) Aurengeebe. Mulgrave had engaged in a duel with Rochester, who had refused to fight at the last minute on the ground of ill-health. Mulgrave allowed this story to spread, and Rochester, who apparently thought him too dangerous an opponent, revenged himself on Dryden as Mulgrave's protegé by setting up as his rivals, first Elkanah Settle, and then John Crowne. By his influence Settle's Emperor of Morocco was played at Whitehall, and Crowne was employed, in direct infringement of Dryden's province as laureate, to write a masque for the court. Both these poets were discarded in turn for Nathaniel Lee and Thomas Otway. In 1679 Mulgrave began to circulate his Essay on Satire in which Rochester was singled out for severe criticism.

Rochester chose to pretend that this was Dryden's work, not Mulgrave's, and by his orders a band of roughs set on the poet in Rose Alley, Covent Garden, and beat him. He obviously felt no shame for this infamous attack, for in his "Imitation of the Fine-Sav'd Satyr" he says, "Who'd be a wit in Dryden's cudgelled skin?" His health was already undermined, and at the spring of 1680 he retired to High Lodge, Woodstock Park. He began to show signs of a more serious temper, and at his own request was visited (July 20th to July 24th) by Bishop Burnet, who attested the sincerity of his repentance. He died, however, two days after the bishop left him. When his son Charles, the 3rd earl, died on the 12th of November 1681, his titles became extinct.

As a poet Rochester was a follower of Abraham Cowley and of Boileau, to both of whom he was considerably indebted. His love lyrics are often happy, but his real vigour and ability is best shown in his critical poems and satires. The political satires are notable for their fierce exposure of Charles II.'s weakness, his ingratitude, and the slavery in which he was held by his mistresses. They show that Rochester had it in him to be a very different man from the criticizing courtier and the "very profane wit" who figures in contemporary memoirs.

Explanatory notes—A Severe Expostulation by an Honourable the Earl of Rochester (Antwerp, 1658) was really printed in London. Other issues, slightly varying in title and contents, appeared in 1685, 1691 and 1696. Valentinian, A Tragedy, adapted from Beaumont and Fletcher, was printed in 1685; a sequel, a knock on Charles II. in the shape of a play in heroic couplets, Sodom, was printed in 1684, and is supposed, in spite of Rochester's denial, to have been chiefly his work. No copy of this is known, but there are two MSS. extant. The complete edition of his Works in five volumes (1731–32) published by his grandson, the 4th earl, and consisting of all known poems, was followed by a smaller edition (1753), and in Bishop Burnet's Some Passages in the Life and Death of John, Earl of Rochester (1680), reprinted in Bishop Wordsworth's Ecclesiastical Biography (vol. vi.).

Rochester, Lawrence Hyde, Earl of (1641–1711), English statesman, second son of Edward Hyde, earl of Clarendon, was born in March 1641. After the restoration of Charles II. he sat as member of parliament, first for Newport in Cornwall and afterwards for the university of Oxford, from 1660 to 1679. In 1661 he was sent on a complimentary embassy to Louis XIV. of France, while he held the court post of master of the robes from 1662 to 1675. In 1665 he married Henrietta (d. 1687), daughter of Richard Boyle, earl of Burlington and Cork. When his father was impeached in 1667, Lawrence joined with his elder brother, Henry, in defending him in parliament, but the fall of Clarendon did not injuriously affect the fortunes of his sons. They were united with the royal family through the marriage of their sister, Anne, with the duke of York, afterwards James II., and were both able and zealous royalists. In 1676 Lawrence Hyde was sent as ambas.dor to Poland; he then travelled to Vienna, whence he proceeded to Nijmegen to take part in the peace congress as one of the English representatives. Having returned to England, he entered the new parliament, which met early in 1679, as member for Wotton Bassett; in November 1679 he was appointed first lord of the treasury, and for a few years he was the principal adviser of Charles II. In April 1681 he was created Viscount Hyde of Kenilworth, and in November following earl of Rochester. He was compelled to join in arranging the treaty of 1681, by which Louis XIV. agreed to pay a subsidy to Charles, at the very moment when he was imploiring William, prince of Orange, to save Europe from the ambitions of the French monarch. The conflict between his wishes and his interest they had tended to sour a temper never very equable; at all events the earl made himself so unpleasant to his colleagues that in August 1684 he was removed from the treasury to the
more dignified, but less influential, post of president of the council, a process which his enemy Halifax described as being "kicked upstairs." Although appointed lord lieutenant of Ireland, Rochester did not take up this position; he was still president of the council when James II. became king in February 1685, and he was at once appointed to the important office of lord treasurer. But in spite of their family relationship and their long friendship, James and his treasurer did not agree. The king wished to surround himself with Roman Catholic advisers; the earl, on the other hand, looked with alarm on his master's leanings to that form of faith. In January 1687 he was removed from his office of treasurer, being solaced with a pension of £4000 a year and a gift of Irish lands.

After the revolution of 1688 Rochester appeared as a leader of the Tories, and he opposed the election of William and Mary as king and queen, raising his voice for the establishment of a regency on behalf of the exiled James. But he soon reconciled himself to the new order, perhaps because he could not retain his pension unless he took the oaths of allegiance. After this he was quickly in the royal favour and again a member of the privy council. He advised the queen in ecclesiastical matters, and returned to his former position as the leader of the High Church party. In 1695, when the hammering of the Treaty of Ryswick assigned him the position of lord lieutenant of Ireland, although he did not spend much time in that country, and the concluding years of his public life were mainly passed in championing the interests of the Church. In 1710 he was again made lord president of the council. He died on the 2nd of May 1711, and was succeeded by his only son, Henry (1672–1758), who in 1724 inherited the earldom of Clarendon. When Henry died without issue on the 10th of December 1758 all his titles became extinct.

Lawrence Hyde had some learning and a share of his father's literary genius. The main employment of his old age was the preparation for the press of his father's History of the Rebellion, to which he wrote a preface. Like most of the men of his time, he drank deeply, and he was of an arrogant disposition and had a violent temper. In Dryden's satire of Absalom and Achitophel he is "Hushal," the friend of David in distress.

The correspondence of Rochester with his brother the earl of Clarendon, together with other letters written by him, was published with notes by S. W. Singer (1829). Other authors are G. Bonatti, History of England by them 21 vols. 1718–20 and 1730 (4th ed. 1800); John Evelyn, Diary, edited by H. B. Wheatley (1879); and Macaulay, History of England.

ROCHESTER, a city, municipal and parliamentary borough of Kent, England, on the river Medway, 33 m. E.S.E. of London by the South-Eastern & Chatham railway, contiguous to Chatham and Strood. Pop. (1901) 30,590. Chatham lies east of the city on the same bank of the river, while Strood is opposite, on the left bank, being connected with Rochester by a railway bridge and by an iron swing bridge, the latter occupying the site of a bridge which spanned the Medway before the Conquest. The cathedral church of St Andrew was originally founded by Augustine in 604, for whom Æthelbert built the church. It was partially destroyed by the Danes, but was rebuilt, with a long choir and square east end, by Bishop Gundulf, the second Norman bishop (1077–1106). Gundulph at the same time (1089) established an order of Benedictine monks here. Bishop Ermulf (1115–24), who as prior of Canterbury and abbot of Peterborough had already distinguished himself as a builder, completed and also endowed the church, lengthening it by two bays eastward; the old choir-house remains. The beautiful Norman west front was built about 1125–30, and in 1130 the new cathedral was consecrated. About 1201 a baker, William of Perch, while on a pilgrimage was murdered near Rochester by robbers. He was buried in the cathedral and was canonized, his shrine becoming a famous resort of pilgrims, who brought much wealth to the monastery. The edifice suffered from fire in 1137 and in 1171. During the whole of the 13th and a part of the 14th century a gradual rebuilding, or sometimes mere recasing, of the church was effected from east to west. The work included an extended choir by William de Hoo (1227), enlargement of the main transepts, the building of pipe for a central tower, and treatment of the nave to the third bay. About 1352 a low central tower was built, to which a spire was added in the next century. Towards the end of the 15th century St Mary's chapel was added, the Norman clerestory was rebuilt, and a great west window inserted. Though a comparatively small building, being only 306 ft. in length and 63 ft. in breadth at the nave, the cathedral is of much architectural interest, and exhibits a variety of styles from Norman to Perpendicular. The rich and varied decoration of the Norman nave (especially the triforium) is very noteworthy, as is also the chapter-house doorway, a fine example of Decorated work. The Early English portion of the building is less successful. The ruins of Gundulph's Tower stand detached from and are earlier than the church; this tower was built by Bishop Gundulph probably as a defensive work for the eastern boundary of the city. The crypt beneath the choir is of special interest, showing early Norman work in the western part. The remainder is Early English, and there are traces of mural painting. The cathedral contains many interesting monuments, including a plain slab assigned to Gundulph, and several tombs of bishops of the 13th century, among them that of Bishop Roger, who was buried under the drill in the churchyard of St Saviour's, Merton College, Oxford (d. 1277). The library attached to the modern chapter-house contains, among various valuable relics, the Texius Roffensis, being records of the cathedral compiled in the time of Bishop Ermulf. The old episcopal palace is partly converted into dwelling-houses. Portions of the wall of the priory dormitory and the refectory doorway may also still be seen. Among various restorations of the cathedral in the 19th century the earliest was that of Lewis Cottingham (1825–27), who erected a Decorated central tower unsuited to the general character of the building. Bishop Hamo de Hythe (1310–52) had erected a tower with short spire of timber and lead, and of this the general design is reproduced in the present tower and spire from designs of Mr C. H. Fowler, begun in 1904 under Dean Hole, who, however, did not survive to see its dedication on St Andrew's day at the close of the same year.

The parish church of St Nicholas was built in 1421, and restored after a fire in 1892. In Saxon times the cathedral was the parish church, but after the establishment of a monastic college, monks quarrelled as to their rights, and a new parish church was built.

On the eminence overlooking the right bank of the river and commanding a wide view of the surrounding country are the extensive remains of the Norman castle, part of which was built by Bishop Gundulph at the order of William Rufus towards the close of the 11th century. The castle was besieged by King John, by Simon de Montfort in the reign of Henry III., and in the reign of Richard II. by a party of rebels during the insurrection of Wat Tyler. It was repaired by Edward IV., but soon afterwards fell into decay, although the massive keep is still in good preservation. This, one of the finest relics of its kind in England, is considered to be the work of William de Corbel, archbishop of Canterbury, to whom the castle was granted in 1126. It is a quadrangular four-storied structure, flanked by turrets, with an extreme height of 120 ft. Remains of the 13th-century walls which once surrounded the city also exist. Gad's Hill, above Strood, to the north-west, is famous as the residence of Charles Dickens. At Bostall, south-west of Rochester, is a large convict prison. Among the principal public buildings of secular character in the city are the town hall (1687), the corn exchange with free library and a museum, the county court offices, and the Richard Watt's almshouses (1579). Besides these almshouses there are a number of other charities, among which the almshouse of St Catherine originated in 1316 as a leper's hospital. A picturesque Elizabethan mansion was acquired by the corporation for a museum as a memorial of Queen Victoria's Diamond Jubilee. The principal schools are the cathedral grammar-school or King's School, founded in 1544, and the Williamson mathematical school (1704), formerly
for the sons of freemen, but now open to all. Rochester has an oyster fishery of some importance, and there is a considerable shipping trade, a quay and landing-place being erected by the corporation. There is a large steam-engine manufactory. In Strood, which is a ward of the borough of Rochester, there are oil-mills, and brick and cement works. The dockyards and government works of Chatham employ many inhabitants of Rochester. The parliamentary borough returns one member. The city is governed by a mayor, six aldermen, and eighteen councillors. Area, 2933 acres.

ROCHESTER: a city and the county seat of Olmsted county, Minnesota, U.S.A., on the Zumbro river, about 70 m. S.E. of St. Paul. Pop. (1890) 5521; (1900) 6843; (1905, state census) 7233 (1905 foreign-born); (1910 census) 7844. It is served by the Chicago & North-Western and the Chicago Great Western railways. The city has a public library (1886), and is the seat of St. John's School and the Academy of Our Lady of Lourdes (both Roman Catholic). It has a state hospital for the insane (1828), originally planned (1877) as an inebriate asylum, liquor dealers being taxed for its erection, and of St. Mary's Hospital (1889), a famous institution founded and maintained by the Sisters of St. Francis. There is valuable water-power, and the city has grain elevators and various manufactures. Rochester was first settled in 1854, and was chartered as a city in 1858.

ROCHESTER, a city of Strafford county, New Hampshire, U.S.A., on the Cocheco and Salmon Falls rivers, about 30 m. E. by N. of Concord. Pop. (1890) 7296; (1900) 8466, of whom 1651 were foreign-born; (1910 U.S. census) 8886. Area, about 34 sq. m. Rochester is served by four lines of the Boston & Maine railroad. The rivers furnish excellent water-power for various manufactures. Rochester, named in honour of Lawrence Hyde, earl of Rochester, was incorporated as a town by a royal charter in 1722, but no settlement was made here until 1778. From parts of the original town Farmington and Newmarket were set off respectively, and in 1846 part of Rochester was annexed to Barrington. It was the birthplace of John Parker Hale. Rochester was chartered as a city in 1801.

See F. McDuffee, History of the Town of Rochester, New Hamp¬shire (Rochester, 1892).

ROCHESTER, a city and the county-seat of Monroe county, New York, U.S.A., about 70 m. E.N.E. of Buffalo and about 230 m. W. of Albany, on the Genesee river, 7 m. above where it empties into Lake Ontario. Pop. (1880) 89,366; (1890) 133,896; (1900) 162,608, of whom 49,748 were foreign-born (including 15,085 Germans; 7746 English-Canadians; 5590 Irish; 3909 English; 1777 Russians; and 1278 Italians) and 601 were negroes; (1910, census) 218,140. Rochester is served by the Erie, the Pennsylvania (two divisions), the Lehigh Valley, the West Shore, the Buffalo, Rochester & Pittsburg (two divisions) and the New York Central & Hudson River (five divisions) railways. The Genesee river, which cuts through the centre of the city in a deep gorge whose banks vary in height from 50 to 200 ft. is the site for lake craft only for 2½ m. from the mouth, to a point 4½ m. below the city; the Erie Canal runs through the heart of the city and is carried across the river on a stone viaduct of seven arches, 850 ft. long, and having a channel 45 ft. wide. Several lines of freight and passenger steamboats connect with Buffalo, Oswego and other lake ports, and there are daily passenger steamboats to Toronto, Canada, 70 m. distant across the lake. Electric railways connect with neighbouring cities and lake-side resorts on Lake Ontario (Ontario Beach) and Irondequoit Bay, an irregular arm of the lakes, 5 m. long 2 m. E. of the city limits. Rochester is on high plateaus on either side of the Genesee river at a general altitude of about 500 ft. above sea-level. It occupies an area of 20-3 sq. m. Within the city limits are the famous Falls of the Genesee, 3 three cataracts of 96, 26 and 83 ft. respectively, the banks above the first fall, which is in the heart of the city, rising to a height of fully 200 ft. above the river. From the city limits the river falls 283 ft. in its 7 m. course to the lake. Ten bridges, road and railway, connect the two sides of the river.

Rochester is an attractive city, with many fine avenues. East Avenue is perhaps the most beautiful street in the city, and Plymouth, West and Lake Avenues are other prominent residential streets. The park system of Rochester, planned by Frederick Law Olmsted, was 1264 acres in extent in 1908. The largest park is Eastman-Durand (512 acres), on the shore of Lake Ontario; Genesee Valley Park (443 acres) is on both sides of the river; Seneca Park (212 acres) includes a zoological garden; Highland Park (75 acres) and eleven other smaller parks. In Washington Park there is a soldiers' monument surmounted by a statue of Lincoln, and a statue (1898) by S. W. Edwards of Frederick Douglass, the negro orator and editor, who lived in Rochester in 1847-70, stands at the approach to the New York Central & Hudson River railway station. The principal cemeteries are the Mount Hope, the Holy Sepulchre, and Riverside. The Powers Building, a 7-storey stone and iron structure surmounted by a tower 204 ft. high, was one of the first office buildings in the United States to be equipped with elevator service. The Monroe County Court House (of New Hampshire granite) on West Main Street is in the Renaissance style, and contains a library of about 25,000 volumes. The City Hall (of grey sandstone) has a tower 175 ft. high. Among the other prominent buildings are the Post Office, the Chamber of Commerce, the Lyceum Theatre, the Temple Theatre, the Masonic Building, the Buffalo, Rochester & Pittsburg office building, the Sibley building, the Duffy-McInnerney building, and the Young Men's Christian Association building. The following churches are architecturally noteworthy: the Central, the First and the Third Presbyterian, the Brick Presbyterian, St Patrick's Cathedral (Roman Catholic), the Cornhill and the Asbury (Methodist Episcopal), the First Baptist, St. Paul's (Protestant Episcopal), and the First Unitarian. Rochester is the see of a Roman Catholic bishop. In Rochester are the Western New York Institution for the Education of the Blind; St Mary's Convent, the Monroe County Penitentiary, a State Arsenal, a State Hospital for the Insane, the Protestant Episcopal Church Home, Rochester City Hospital (1864), and others, including the Rochester Municipal Hospital (1903) for contagious diseases and consumption.

Rochester is an important educational centre. Its best-known institution is the University of Rochester (Baptist, 1850; co-educational since 1900), having in 1908-9 28 instructors, 535 students (231 men and 121 women), and a library of 49,000 volumes. It occupies a tract of 24 acres

1 From the top of the upper falls (65 ft. high), in the centre of the city, Sam Patch (1807-1829) jumped and was killed in November 1859; he had formerly made the same leap, had jumped half the depth of Niagara, and was planning to go to London and jump from London Bridge—he was to go by sailing packet to Liverpool and jump from the yard-arm every fair day.
on University Avenue in the eastern part of the city. With it is connected the Ward Museum, containing the valuable zoological and botanical collections of Henry Augustus Ward (1834-1906), an American naturalist, professor of natural sciences here in 1860-75, who had in Rochester a laboratory for the manufacture of plaster-casts of fossils, and who prepared natural-history cabinets for many museums. Much of the success of the university was due to Martin Brewer Anderson (1815-1890), president from 1853 to 1888, and David Jayne Hill (b. 1850), who was president from 1888 to 1896, and subsequently was assistant secretary of state in 1898-1903, and minister to Switzerland in 1903-5 and to the Netherlands from 1905 to 1907, when he became ambassador to Germany. Rochester Theological Seminary (1850) is also under the control of the Baptist Church, but has no organic connexion with the university of Rochester. Its library of 36,500 volumes includes the valuable collection (6,500 vols.) of the German church historian, Johann August Wilhelm Neander. Other educational institutions include St. Bernard's Theological Seminary (Roman Catholic, 1863); Wagner Memorial Lutheran College (German); Academy of the Sacred Heart (Roman Catholic), &c. One of Rochester's most noteworthy institutions is the Athenaeum and Library (1814), an outgrowth of the Rochester Athenaeum, established in 1829; it was founded in 1858 by Henry Lomb, of the Bausch & Lomb Optical Co., and has a large building, the gift of George Eastman (b. 1854), of the Eastman Kodak Co. It has an endowment of $65,000, and more than 60 instructors, and in 1907-8 more than 5,000 students were enrolled. Since 1907 public school buildings have been used as club-houses for community civic clubs with libraries and gymnasia; and in 1909 a League of Civic Clubs was organized. Besides the law library and the libraries of the educational institutions mentioned above, Rochester has the Reynolds (Public) Library, containing more than 65,000 volumes in 1910.

The Falls of the Genesee provide a valuable water-power, early utilized by the flour-milling industry, of which, owing largely to the nearness of the fertile wheat-fields of the Genesee Valley and the transportation facilities furnished by the Erie Canal and Lake Ontario, as well as to the water-power, Rochester was for many years the most important centre in the country. Flour-milling is no longer so important an industry here, but Rochester ranks high among the great manufacturing cities of the country, holding third place of importance in 1900. Rochester is noted for the manufacture of organs, and in number of wage-earners employed the manufacture of men's clothing stood first; the value of the product was $14,948,703, or more than 18% of the total value of all the city's manufactory goods. The value of the value of boots and shoes, of men's clothing and in number of wage-earners employed the manufactory goods ranged seventh among the cities of the United States in 1900. The manufacture of photographic apparatus and materials and optical goods Rochester easily holds first place in the world, and has the largest establishment for the manufacture of cameras (the Eastman Kodak Co., 1884), and microscope and camera manufacturing companies. Telephones, opera and field glasses (Bausch & Lomb Optical Co.), the total value of the photographic apparatus in 1905 was $2,886,071, which represented 82% of the product value of photographic apparatus. In the United States, the Kodak manufactory is second in size only to the plant of the Eastman Kodak Co. The value of iron and steel products in 1905 was $9,404,850; the value of boots, shoes, and other footwear, $4,234,531; malt liquors, $2,173,707; confectionery, $1,512,611; lumber, $1,405,220; planing mill products, $1,405,220; carriages and wagons, $1,229,570; and stationery goods, $1,130,873. Rochester is also the nursery-gardening centre of the United States. The first nursery, that of Ellwanger & Barry, now one of the largest in the world, was established here in 1830. There are now more than a score of large nurseries, representing an investment of several millions of dollars, and annually shipping seeds, bulbs and plants having an approximate value of $2,000,000. Rochester is the port of entry for the Genesee customs-district, importing Canadian lumber and wheat and exporting dairy, garden, farm and orchard products. In 1909 its imports were valued at $1,607,476 and its exports at $1,360,367.

The government of Rochester is that of cities of the first class (the state census of 1905 showed that it had more than the 175,000 inhabitants necessary for a city of the first class under the New York state law). The city owns its water supply system, the supply being derived from Honeoye Lake, 40 miles S. of the city limits. The value of the plant is approximately $8,000,000. Rochester is famous for the purity of its milk supply, which is regulated under a strict system of supervision and inspection.

The region about Rochester, when first visited by Europeans, was the home of the Seneca Indians. The Jesuits, Peter Joseph Marie Chaumonot (1611-1693) and Jacques Frémont (d. 1691), worked among the Indians in the neighborhood. In 1687 the marquis de Denonville fought a battle with the Iroquois near the site of Rochester. In 1738 the French post on Iroqouet Bay. The district was included in the Phelps-Gorham Purchase in 1788. It was not until Ebenezer Allan (called "Indian Allan") built a saw and grist mill at the falls in 1790 that a small settlement began to grow up. In 1802 a large tract of land, which included the site of the present city, passed into the hands of three Maryland proprietors, Charles Carroll, William Fitzhugh, and Nathaniel Rochester (1752-1831). Rochester, from whom the city took its name, was a native of Virginia, had been a manufacturer at Hagerstown, Maryland, and after settling in Rochester in 1818 was a member in 1822 of the New York Assembly. He established a settlement, largely of New Englanders, at the falls in 1820-12, but its growth was slow as it was not on the direct road between Albany and Buffalo, and the region was malarial. It was known at first as "The Falls" or "Falls Town." In 1817 it was incorporated as the village of Rochesterville, the name being shortened to its present form two years later. In 1820 it had only 1,502 inhabitants. In 1821 Monroe county was erected with Rochester as the county-seat. The real growth of the place near the completion of the Rochester and Lockport section of the Erie Canal in 1828-9. In two years the population had about doubled. Rochester was first chartered as a city in 1834, with 12,000 inhabitants. Rochester's first newspaper, the Gazette, was established in 1816, the Telegraph following in 1818. The first daily newspaper was the Daily Advertiser (1820). Between 1828 and 1830 Rochester was the centre of the anti-Masonic political movement, and here Thurlow Weed published his Anti-Masonic Enquirer. Subsequently it was a centre of the abolitionist movement in New York state; Myron Holley (1779-1841) began here the publication of his Freeman in 1839, and in 1847 Frederick Douglass established the North Star. For many years before the Civil War it was a busy station of the "Underground Railroad," by which fugitive slaves were assisted in escaping to Canada. In 1846 Miss Susan B. Anthony settled in Rochester, and the city has been a gathering-place for advocates of women's rights. Here lived the Fox sisters, Margaret (1836-1865) and Katharine (b. 1839), whose spiritualistic demonstrations became notorious about 1850 as the "Rochester Rappings," and the city has been a leading place for American spiritualists also. The narrowness of the gorge of the Genesee which the Genesee river runs has always rendered the city liable to disastrous floods. Several of these in its early history practically destroyed the manufacturing industries along the river, but the loss of property in the more recent ones has been relatively less; that of 1865 entailed a loss of more than $1,000,000, and in that of 1902 the damage exceeded $1,500,000.

ROCHET (Lat. rocheturn, from the late Lat. rocox, connected with the O.H. Ger. roch, roc, and the A.S. roc; Fr. rochet, Ital. roccello, Sp. roque, Ger. Rochell, Chorkleid), an ecclesiastical
vestment. In the Roman Catholic Church the rochet is a tunic of white, and usually fine linen or muslin (battiste, mull) reaching about to the knee, and distinguished from the surplice by the fact that its arms are narrow and tight-fitting. The lower edge and the sleeves are usually garnished with lace, lined with violet or red silk in the case of prelates, or—more rarely—with embroidered borders.

The rochet is proper to, and distinctive of, prelates and bishops: but the right to wear it is sometimes granted by the pope to others, especially the canons of cathedral churches. It is not a vestis sacra, and cannot therefore be used as a substitute for the surplice, e.g. in the administering of the Sacraments (Decree of the Congregation of Rites of Jan. 10, 1852). None the less, since it is used at choir services and is ordered to be worn over the everyday dress at Mass (Missa rom. Rit. celebr. i. 2), it may be included among liturgical vestments in the widest sense.

The earliest notice of the use of the rochet is found in an inventory of the vestments of the Roman clergy, dating from the 9th century. In this it is called camisia, a name which it retained at Rome until the 14th century, and it seems to have been already at that time proper to particular members of the clergy. Other Roman names for the vestment were succa, sucata; it was not till the 14th century that the name rochettum applied at Rome, but it was not long before it had replaced all the native designations. Outside Rome, too, the vestment is early meet with, e.g. in the Frankish empire (9th century) as alba clericalis, in contradistinction to the liturgical alb, and in England (10th century) under the name of oferdip in the 46th canon of the ecclesiastical laws of Edgar. At the beginning of the 12th century the rochet is mentioned, under the name of camisilia, by Gilbert of Limerick and by Honorius, and, somewhat later, by Gerlof of Reichersperg as tunica talaris. From the 13th century onward it is frequently mentioned. The name rochettum is first traceable in England; in Germany and northern France the rochet was also called saroth (sarotus) or sarces (sarcolium).

Outside Rome the rochet was, until well into the 14th century, a vestment common to all the clergy, and especially to those of the lower orders; and so it remained, in general, until the 16th century, and even, here and there, so late as the 19th. Moreover, in further contradistinction to the Roman use, it had—especially in the German dioceses—a liturgical character, being used instead of the surplice.

The rochet was originally a robe-like tunic, and was therefore given the name of a liturgical tunic. So late as 1260 the provincial synod of Cologne decreed that the vestis camisialis must be long enough entirely to cover the everyday dress. A good example of the camisia of the 12th century is the rochet of Thomas Becket, preserved at Darmstadt in the Pal de Calais, the only surviving medieval example remarkable for the pleating which, as was the case with albbs also, gave greater breadth and more elaborate folds. In the 15th century the rochet only reached half-way down the shin; in the 16th and 17th to the knee; in the 18th and 19th often only to the middle of the thigh. In the middle ages it was always plain. The rochet is unknown in the Eastern Churches.

Church of England.—In the English Church the rochet is a vestment peculiar to bishops, and is worn by them, with the chime (g.s.) both “at all times of their ministration” in church and also on ceremonial occasions outside, e.g. in the House of Lords or at a royal levee. In general it has retained the medieval form more closely than the Roman rochet, in so far as it is of plain, very fine linen (lawn), and reaches almost to the feet. The main modifications have been in the sleeves. At the time of the Reformation these were still narrow, though already showing a tendency to expand. The portrait of Archbishop Warham at Lambeth, for instance, shows a rochet with fairly wide sleeves narrowing towards the wrists, where they are confined by fur cuffs. This fashion continued until, in the 17th century, the sleeves became much fuller; but it was not till the 18th century that they developed into the familiar exaggerated balloon shape, confined at the wrists by a ribbon, beyond which a ruffle projected. About the same period, too, arose the custom of making the rochet sleeveless and attaching the “lawn sleeves” to the chimeré. This fashion survived throughout most of the 19th century, but there has since been a tendency to revert to the earlier less exaggerated form, and the sleeves have been reattached to the rochet. The ribbon by which the wrist is confined is black, except when conversation robes are worn, when it is scarlet. The rochet is worn without the chime under the cope by those bishops who use this vestment. At his consecration the bishop-elect is, according to the rubric, presented to the consecrating bishops vested in a rochet only; after the “laying on of hands” he retires and puts on “the rest of the episcopal habit,” i.e. the chimeré.

ROCHFORD, EARL OF, an English title borne by the family of Nassau de Zulestein from 1695 to 1830. William Henry Nassau de Zulestein (1645-1709) was born at Zuylenstein, near Utrecht, his father being Frederick Nassau de Zulestein (1608-1672), a natural son of Henry Frederick, prince of Orange, and his mother an English lady, Mary Killigrew. One of the most trusted companions of his kinsman, William of Orange, Zulestein was sent to England in 1667 and again in 1668 to report on the condition of affairs, and later in 1668 he sailed with the Prince of Orange on his expedition. After the Revolution he was naturalized and served the king in the field, being created Viscount Tunbridge and earl of Rochford in 1695. He was succeeded by his son William (1681-1710), who was killed at the battle of Almenara, and then by another son Frederick (1682-1738). Frederick’s son, William Henry, the 4th earl (1717-1781), was a diplomatist and a statesman. Having gained experience as envoy at Turin from 1740 to 1753, he was ambassador at Madrid from 1763 to 1766 and at Paris from 1766 to 1768. From 1768 to 1775 he was one of the secreats of state. This earl left no children when he died on the 28th of September 1781, and his nephew, William Henry, the 5th earl (1754-1830), dying in September 1830 the earldom became extinct. The estates of the earls of Rochford were in Suffolk and Essex, their principal residence being St Osyth Priory in the latter county.

ROCHFORD, a town in the south-eastern parliamentary division of Essex, England, 39 m. E. by N. from London by the Southend branch of the Great Eastern railway. Pop. (1901) 1,829. It lies on the small river Roch, near the head of a long estuary. The town has a Perpendicular church (St Andrew), an exchange and some agricultural trade. Rochford Hall, a picturesque gabled mansion of various dates, belonged once to the Boleyns, and it has been stated that Anne Boleyn, the unfortunate queen of Henry VIII., was born here, but this is in no way proved. Near Rochford the Lawless or Whispering Court, a remarkable survival of unknown origin, is held by a manorial tenure on the Wednesday following Michaelmas Day, beginning at midnight. No light is permitted, nor may voices be raised above a whisper. Nearly 3 m. N.W. from Rochford is Ashington. This is generally accepted as the scene of the fight of Assandun in 1066 between Canute and Edmund Ironside, in which the English were defeated through treachery in their ranks. Earthworks, of this or an earlier date, remain.

ROCK, DANIEL (1799-1871), English Roman Catholic priest and ecclesiologist, was born at Liverpool on the 31st of August 1799, and educated at St Edmund’s College, Ware, Herts, and at the English College, Rome. He was ordained priest in 1824 and successively appointed chaplain to the 16th earl of Shrews- bury at Alton Towers, Staffordshire, and priest in charge of the Roman Catholic congregation at Buckland, near Faringdon in Berkshire. After the re-establishment of the Roman Catholic hierarchy in England, in which he had taken an active part, Rock was elected a canon of St George’s Cathedral, Southwark. He was greatly interested in medieval art, and, having gone to live at South Kensington in 1864, in order to be near the museum, was of great assistance to the authorities there. He died on the 28th of November 1871.
ROCKS. 433

Rock's principal works are: Hieroglyphic, or the Holy Sacrifice of the Mass expounded (London, 1833; revised edition by W. H. J. Weale, 1893), an exhaustive account of the Eucharistic rites in the Latin, Greek, and Oriental Churches, and illustrated from early paintings, sculptures and inscriptions: The Church of Our Fathers, as seen in St. Osmond's Rite for the Cathedral of Salisbury, with Dissertations on the Belief and Ritual in England before the Coming of the Normans (3 vols., 1849-54; new edition by G. W. Hart and V. F. Frere, 1903).

ROCK (O.Fr. roche, Sp. roca, Ital. rocca; possibly from a Lat. form rupicula, from rupes, rock), in geology a mass of the mineral matter of which the crust of the earth is composed (see Petrology and Geology). In more general usage a "rock" is a large mass of this mineral matter, as distinguished from smaller pieces which are termed "stones."

From this word must be distinguished the verb "to rock," to swing an object and rocker, particularly in a cradle in which a child is rocked to sleep, the original meaning. The O.Eng. word is roccian, and is cognate with many words in Teutonic languages, e.g. Du. rukke, Dan. rytte, Ger. richten, to pull, tug, push.

ROCK-CRYSTAL, a colourless and transparent variety of quartz (q.v.), used as an ornamental stone. It usually occurs as crystals lining cavities in quartz-veins, which often run through granite, gneiss and crystalline schists. The limpidity of the crystal, its coldness to the touch and its common occurrence in rocks among Alpine glaciers, led to the ancient belief that it was kind of concealed water, whence the name crystal, from Gr. κρυστάλλος (ice). In the Swiss Alps the "Strohler," or crystal gatherer, searches the rocks at much personal risk, and is often led to a dusty cavity by tracing narrow veins, or strings, of quartz on the mountain-side. A remarkable druse, or Kry-

stalking, discovered at Zinkenstock in the Bernese Oberland, in 1719, yielded about 20 tons of crystal, a single specimen weighing 8 cwt. The famous discovery of the Galienstock, in 1867, furnished magnificent crystals, but they were dark brown or smoky quartz. La Gardette, near Le Bourg d'Oisans, in the Alps of Dauphiné, is a notable locality for fine specimens of rock-crystal. The Alps and India probably furnished the ancients with their supplies.

Rock-crystal has been used for ornamental purposes since the Mycenean period. By the Romans under the Empire it was highly valued, and carved into vases and goblets, in some cases also in large engraved platters. Lenses or globes were used for kindling the sacrificial fire, and for defocussing the light, whilst ladies carried balls of crystal in order to cool their hands during the heat of summer. The artists of the Early Renaissance greatly favoured the use of rock-crystal, and executed beautiful carvings in this material. In modern times the use of rock-crystal has been largely superseded by that of glass, and it is notable that flint-glass is known in France as "crystal," probably from its resemblance to limpid quartz, or perhaps from the fact that powdered rock-crystal has been used as a source of silica in the manufacture of the finest glass. Rock-crystal is still cut as a faceted stone for personal decoration, but though not without brilliancy it lacks the "fire" of many gemstones. It is often known locally by such names as Bristol diamond, Cornish diamond, Isle of Wight diamond, Briançon diamond, Marmaros diamond, Lake George diamond, &c. Rock-crystal is also carved into seals, paper-weights and other objects. A popular use is in the form of rings, buttons, and other small ornamental objects, frequently to be seen as a supplement to the diamond.

The "pebble" for lenses is found loose in the soil in many parts of the provinces of Goyaz, São Paulo and Minas Geraes in Brazil. Much of the material for spectacles comes also from Madagascar, where large crystals of clear quartz are found in the beds of certain streams, especially in the N.E. part of the island, having probably been derived from quartz-veins in the gneiss and pegmatite. In India rock-crystal has been worked at many localities, and the loft of the palace of Delhi yielded marvellous ornaments carved in this material. At the present day it is cut and polished at Veilum in the Tanger district in Madras, and is known as Veilum stone. Among the numerous localities in the United States which yield rock-crystal mention may be made of those in Herkim Co., New York State, whence the Lake George crystals are obtained; and it is stated that some of the Herkimer quartz encloses bituminous matter. Mokelumne Hill, Calaveras Co., California, has furnished some remarkable rock-crystal. In Europe the localities are very numerous, the most important being those in the Alps. Very fine crystals remarkable for pellucidity though not of large size occur in the staurolite marble of the United States, and the hollowed crystals known from Portoletta near Bologna in Italy. The finest rock-crystal in Great Britain occurs at Tintagel and the Delabole slate quarry in N. Cornwall; and at Snowden in N. Wales.

ROCKEFELLER, JOHN DAVISON (1839-), American capitalist, was born in Richmond, Tioga county, New York, on the 8th of July 1839. In 1853 his family removed to Ohio, living after 1857 in Cleveland, where Rockefelder had begun to work as a bookkeeper in 1855 and where in 1858 he went into the produce commission business. His firm, Clark & Rockefelder, in 1865 invested in an oil refinery, planned by Samuel Andrews, and in 1865 Rockefelder sold out his share to his partner Clark, bought for $7,200,000, an interest in another refinery, and formed the partnership of Rockefelder & Armour Co.; and in the same year another refinery was started by Rockefelder's brother William (b. 1841), but in 1867 Rockefelder & Andrews absorbed this business, and Henry M. Flagler was added to the partnership.

In 1870 the two Rockefellers, Flagler, Andrews and a refiner named Stephen V. Harkness formed the Standard Oil Company, with a capital of $1,000,000 (increased in 1872 to $2,500,000 and in 1874 to $3,500,000), of which John D. Rockefelder was president. This great corporation gradually established itself in practical control of the oil production in America, by means of business methods and financial operations which have been severely criticized, but which brought immense wealth to those concerned. Its capital was further increased in 1882, when separate companies were organized in each state; and in later years, as the first great American "trust," the Standard Oil Company was hotly attacked during the anti-trust movement (see INTER-COMMERCE). Into the merits of this question it is impossible to enter here. Rockefelder himself retired from active business in 1895; he had for a time taken an interest in mines and ore-carrying vessels) Lake Superior, which he sold to the United States Steel Corporation, and his personal wealth was probably greater than that of any other man in the country. In private life he was a devoted member of the Baptist church, and his benefactions were numerous. To the "University of Chicago founded by John D. Rockefelder" (in 1892) he had given, up to 1910, $24,800,666, while to the General Education Board he had given $43,000,000; he founded (1901) and supported the Rockefeller Institute for Medical Research in New York City; he gave large sums to Rush Medical College in Chicago, to Johns Hopkins Hospital in Baltimore, to Barnard College in New York City and to the Baptist Missionary Society; and in 1909 he gave $1,000,000 to endow a medical commission to investigate the nature of the hook-worm and the means of combatting it.

See Ida M. Tarbell's History of the Standard Oil Company (New York, 1903), a severe attack on the Trust; also his own Random Reminiscences (1909).

ROCKET. (Fr. rocquette, Lat. erucu, a kind of cabbage) of two species of plants. The one, Erucus sativa, is a cruciferous annual with white flowers veined with purple; the leaves have a sharp flavour and are used in southern Europe for salads. The other is a hardy perennial herbaceous plant, of the genus Hesperis, of which Hesperis matronalis is the most familiar species (see HORTICULTURE).

(2) A cylinder of paper, pasteboard or metal, filled with an explosive mixture. This word, which appears in many forms in various languages, is from the L. rocheta, diminutive of rocca, a distaff, the obsolete English "rock;" the application
is due to a resemblance in shape. Rockets are used in pyrotechny for purpose of display, scattering showers of stars, coloured balls, &c., on bursting (see Fireworks). They are also used in signalling, and especially as a part of lifesaving apparatus for wrecks (see Lifeboat and Life-Saving Service).

Large and heavy rockets, of which the head formed a projectile, had too a considerable vogue in the early part of the 19th century for war purposes. They were invented by Sir William Congreve (q.v.) and employed by him both aloft in coast operations and in field operations. Brought to the notice of all armies by the fact that a rocket battery of the Royal Artillery served in the allied army in the Leipzig campaign, war rockets were introduced in many armies, being sometimes issued as an additional portion of the equipment of ordinary field batteries, sometimes reserved for special rocket batteries. The Congreve rocket was in use in the British army as late as 1860. There were four types—3-pounder, 6-pounder, 12-pounder and 24-pounder. The case was of sheet-iron, on to which was screwed a cylinodo-conoidal head forming the projectile. The head was made hollow and could be filled with a bursting charge if a shell effect was desired, a base fuse being placed in the rear. The charge contained the rocket composition and ground was closed at the rear end by a metal plate with five holes or vents, and on the centre a bush into which the stick was screwed. These rockets were fired from rocket tubes on tripods, the tubes being provided with a tangent sight. Against masses of troops within easy range, the war rocket was considered an efficient engine; it was used also to set fire to buildings, but was always deficient in accuracy. Eventually the Congreve rocket was superseded by the Hale, of which two patterns were in use, the 9-pounder and the 24-pounder, for field and fortress warfare respectively. These had no sticks, and were centred by the arrangement of the vent, the gases, as they emerged from the vent, impinging upon a screwed-formed tail, to which they imparted the necessary rotation. These rockets were fired from a trough. The maximum effective range of the 9-pounder Hale rocket was about 1,200 yards. The use of these engines was discontinued in the British service about 1885. On the continent of Europe they had disappeared more than twenty years before. Austria, the last power to use them, broke up her war batteries in 1877.

**ROCKFORD**, a city and the county seat of Winnebago county, Illinois, U.S.A., on the Rock river, in the northern part of the state, about 85 m. N.W. of Chicago. Pop. (1890) 23,584; (1900) 31,051, of whom 9337 were foreign-born (6600 Swedes); (1910 census) 45,491. Area, 8,91 sq. m. It was served by the Chicago, Burlington & Quincy, the Chicago, & North-Western, the Chicago, Milwaukee & St. Paul, the Chicago, Milwaukee & Gary ("Rockford Route") and the Illinois Central railways, and is connected by interurban electric railway with Chicago and Freeport, Illinois, and Janesville, Wisconsin. The city has a Memorial Hall, erected in honour of the soldiers and sailors of Winnebago county, and in charge of the Grand Army of the Republic; a soldiers' memorial fountain; a Carnegie library, containing 57,340 volumes in 1909; and the Vele Museum of natural history. Rockford College (non-sectarian), for the higher education of women, is ranked by the United States Commissioner of Education as one of fifteen women's colleges of the highest grade in the country; it was established in 1847 as Rockford Seminary, and was renamed Rockford College in 1892. In 1908-9 it had 106 students. Rockford is the see of a Roman Catholic bishop. In and near the city there are two hospitals and three sanatoriums. Manufacturing is facilitated by good water-power, supplied by a dam across the Rock river about 800 ft. long, constructed in 1844. Among the manufactures are furniture, hosery and knit goods, agricultural implements, foundry and machine-shop products, saddlery and harness, &c. The total value of all factory products in 1905 was $15,276,120 (38.6% more than in 1900). The municipality owns and operates its waterworks; the water supply is obtained from artesian wells. Rockford was first settled in 1834, and was chartered as a city in 1852. More than one-fourth of its area has been annexed to the city since 1886.

**ROCKHILL**, a city of York county, South Carolina, U.S.A., 84 m. by rail N. of Columbia. Pop. (1890) 2744; (1900) 5485 (1706 negroes); (1910) 7216. Rock Hill is served by two lines of Southern Railway. It lies at an elevation of about 670 ft. above the sea. Among the public buildings and institutions are the Federal Government Building, the City Hall, the Carnegie Library and the Winthrop Normal and Industrial College (chartered in 1891 and opened in 1894), a state institution for white girls. Cotton is the most important product of the surrounding country. The Catawba river, 5 m. distant, furnishes good water-power, and in a large power-plant electricity is generated for the city's manufactories. Among the manufactures are cotton goods, cotton-seed oil, yarn, waggons and carriages, foundry and machine-shop products; and there are cotton gins, marble and stone works. The growth of the city has been almost entirely since the Civil War. Rock Hill was incorporated as a village in 1870, and was chartered as a city in 1892.

**ROCKHAMPTON**, the seat of Livingstone county, Queensland, Australia, on the Fitzroy river 43 m. from its mouth, 335 m. in a direct line N.W. of Brisbane. It has a beautiful situation, and its climate, in spite of heat, is healthy. It is the port of a wide agricultural district, which also produces gold, copper and silver. Much of the trade is carried on through the ports of Alma and Broadmount, near the mouth of the river, both available for ocean steamers. Rockhampton has a large trade in frozen meat, and there are factories for extract and meat preserving. Rockhampton is the terminus of the Queensland Central railway and the seat of an Anglican and a Roman Catholic bishopric. Population of the municipality (1901), 15,461; within the 5 m. radius, 19,691; of the separate municipality of North Rockhampton, 2865.

**ROCKHAMPTON, CHARLES WATSON WENTWORTH, 2nd MARQUESS OF (1730-1792)**, twice prime minister of England, was the son of Thomas Watson Wentworth (c. 1690-1750), who was created earl of Melton in 1733 and marquess of Rockingham in 1746. The family of Watson was descended from Sir Lewis Watson (1585-1657), son and heir of Sir Walter Watson (d. 1616) of Rockingham Castle in Northamptonshire. For his services to the king during the Civil War Sir Lewis was created Baron Rockingham in 1645. His grandson Lewis, the 3rd baron (1655-1724), was created earl of Rockingham in 1714, and was succeeded by his grandson Lewis (c. 1700-1745), whose brother Thomas, the 3rd earl, died unmarried in February 1746, when the earldom became extinct. The barony of Rockingham, however, descended to a cousin, Thomas, father of the prime minister, a grandson of Edward, the 2nd baron (1630-1689), who had married Anne, daughter and heiress of Thomas Wentworth, 1st earl of Strafford. The vast estates of the Wentworths had passed to Edward's son, Thomas, who took the additional name of Wentworth, and then to his son, the 1st marquess of Rockingham.

Charles Watson Wentworth was born in 1730 on the 10th of March (according to some, the 13th of May), and was educated at Westminster school and St John's College, Cambridge. He showed his spirit as a boy by riding across from Wentworth to Carlisle in 1745. The family of Watson owned the products of Yorkshire and in his pursuit of the Young Pretender. He was created earl of Malmouth in the peerage of Ireland in September 1750, and succeeded his father as 2nd marquess of Rockingham in December of the same year. In 1751 he became lord-lieutenant of the North and East Ridings of Yorkshire and a lord of the bedchamber, and in 1760 was made a knight of the Garter. After George III had begun his policy of dividing the great Whig families, those Whig noblemen and gentlemen who did not choose to join the sections headed by the Grenvilles, the duke of Bedford, or any other great nobleman, selected as their chief the young marquess of Rockingham. In May 1762 the king's favourite,
the earl of Bute, became first lord of the treasury, and the marquess of Rockingham was amongst those who in the following year were dismissed from their lord-lieutenancies. The opposition now grew so strong that Lord Bute resigned in April 1763, and the king, true to his policy, appointed George Grenville to be his successor. But Grenville's section of the Whig party was not strong enough to maintain him in power long, and in July 1765 Lord Rockingham formed his first administration with General Conway and the duke of Grafton as secretaries of state. The cabinet seemed stronger than it really was, for it was divided by intestine quarrels, and the earl of Chatham refused to have anything to do with it. Nevertheless, Rockingham recovered his lord-lieutenancies and won reputation as a good administrator. In May 1766 the duke of Grafton, a far abler man than Rockingham, though neither so conciliatory in his manners nor so generally popular, succeeded from the government, and in August 1766 he succeeded his former chief as first lord of the treasury and prime minister. Then followed many years of fruitless opposition to the king's personal authority as exhibited through his ministers, but at last, on the 27th of March 1782, Lord Rockingham again became prime minister with Fox and Shelburne (afterwards marquess of Lansdowne) as secretaries of state. This time he entered office with a more abiding determination than in 1758. For he was shortly to retire from the political world. On July 1782 he left no issue, and his property went to his nephew, the 2nd Earl Fitzwilliam, his titles becoming extinct. A few words from his epitaph by Burke deserve quotation as giving the reason of the predominance of such an ordinary man as Lord Rockingham over a party abounding in men of great abilities: "A man worthy to be held in esteem, because he did not live for himself. . . He far exceeded all other statesmen in the art of drawing together, without the seduction of self-interest, the concurrence and co-operation of various dispositions and abilities of men, whom he assimilated to his character and associated in his labours."

See Memoirs of the Marquess of Rockingham and his Contemporaries, by George Thomas, earl of Albermarle (2 vols., 1852); Horace Walpole's Memoirs of the reign of George III., edited by G. F. R. Barker (1894); and the other letters, papers and diaries of the time.

ROCK ISLAND, a city and the county-seat of Rock Island county, Illinois, U.S.A., in the N.W. part of the state, on the E. bank of the Mississippi river, adjoining Moline, and opposite Davenport, Iowa (with a few weeks connected by two bridges), about 3 m. above the mouth of the Rock river, and 187 ft. of Rock Island rapids, which extend for nearly 16 m. Pop. (1890) 13,024; (1900) 14,949, of whom 4412 were foreign-born; (1910) 22,335. It is served by the Chicago, Burlington & Quincy, the Chicago, Milwaukee & St Paul, the Chicago, Rock Island & Pacific, and the Davenport, Rock Island & North-Western railways. Near the city, at the mouth of Rock river, the "Hennepin" (or Illinois & Mississippi) canal joins the Mississippi river. The city occupies a plain lying between the river and a series of bluffs. The island of Rock Island, a ridge of limestone rock about 3 m. long and 1 m. wide, is connected with the mainland by bridges to Rock Island and Moline; on it there are a Federal arsenal, the most important in the country for the manufacture of small-arms, gun carriages and artillery equipment, a Federal armory and a national cemetery; the island is connected with the Illinois shore at Moline by a dam, whence good water-power is derived. In the city are: a public library (1875), the Augustana Seminary (1865), the Theological Seminary (1883), founded by the Evangelical Lutheran Augustana Synod of North America (co-educational), which was founded as Augustana Seminary in Chicago in 1860 chiefly for the education of Swedish Lutheran clergymen, was removed to Paxton, Illinois, in 1861 and to Rock Island in 1875, and received its present name in 1880; and the principal offices of the Modern Woodmen of the World, a fraternal society, founded in 1884 and having 210,792 members in 1909. The city has a large trade by water and rail; commercially it forms a unit with Davenport and Moline. Among the city’s manufactures are lumber, agricultural implements, flour, glass, stoves, carriages, soap, &c. In 1905 the value of the factory product was $5,332,697. Some coal is mined in the county.

On the north bank of the Rock river, 3 m. from its mouth, there was a large summer village (sometimes called Saukenuk) of the Sauk Indians, built about 1730 and destroyed in 1831; and near the mouth of the Rock river is a bluff called "Black Hawk's watch-tower." A settlement on the island was made in 1816, when the fort was built; the first settlement on the mainland was made in 1826. In 1841 the town of Rock Island was formed by the consolidation of two small settlements named Stephenson and Farnhamsburg and was incorporated; it received a city charter in 1849. Upon the west end of the island the United States government in 1816 built Fort Armstrong, where on the 21st of September 1832, at the close of the Black Hawk War, a treaty of peace was signed by General Winfield Scott and Governor John Reynolds of Illinois and by the chiefs of the Sauk and Foxes, and where, six days before, General Scott and Governor Reynolds had made a treaty with the Winnebagos. The fort was abandoned in 1836 and was burned in 1853; a monument now marks its site. The Rock Island armory and arsenal, under an act of 1862, were built in 1863, when a number of captured Confederate soldiers were conscripted there.

ROCKLAND, a city and the county-seat of Knox county, Maine, U.S.A., on Rockland Harbor, Penobscot Bay, 86 m. by rail E.N.E. of Portland. Pop. (1900) 5327; (1910) 5327. It is the eastern terminus of a branch of the Maine Central railway, and is served by an interurban electric line and by steamboat lines to Portland, Boston, Bangor, Bar Harbor and other coast ports. The harbour is protected by a breakwater nearly 5000 ft. long. The principal buildings are the United States Government Building and the County Court House. Granite and limestone are quarried in the vicinity. The granite (biotite, biotite-muscovite and quartz-monzonite) is of fine quality, and has been used extensively in the United States for building and monumental purposes; and the burning of lime is for the most part the industry of the city. The shipbuilding industry is also important. The total value of the city's factory products in 1905 was $4,922,591 (46.5% more than in 1900). Lobsters and fish in considerable quantities are shipped from the city. Rockland was settled in 1769, but its growth began only with the establishment of the lime industry in 1795. It was incorporated as a separate township under the name of East Thomaston. Two years later the present name was adopted, and in 1854 Rockland was chartered as a city.

ROCKLAND, a township of Plymouth county, Massachusetts, U.S.A., about 20 m. S. of Boston. Pop. (1890) 5213; (1900) 5327; (1910 U.S. census) 6028. Area, about 10 sq. m. It is served by the New York, New Haven & Hartford railway, and by interurban electric railway. Among its manufactures are boots and shoes and tacks. There is a public library (1878). Rockland was erected into a township in 1874, having been previously a part of Abington.

ROCKPORT, a township of Essex county, Massachusetts, U.S.A., on the N.E. end of Cape Ann, on the Atlantic Ocean, north-east of Gloucester, and about 35 m. north-east of Boston. Pop. (1890) 4087; (1900) 4502; (1910, U.S. census) 4111. Rockport is the southern terminus of the Gloucester branch of the Boston & Maine railway, and is served by an electric railway extending from Gloucester through Rockport and around the cape. Off Sandy Bay is a rendezvous of the Atlantic squadron of the U.S. navy. The Federal government began in 1884 a harbour of refuge, with an area of 1664 acres, to be protected from north and north-east winds by a breakwater, 117 ft. wide at a depth of 12 ft. below mean low water, rising 22 ft. above mean low water, and 9000 ft. long. In the township are the North Village or Pigeon Cove and the South Village or Rockport. Rockport is a summer resort, and there are many summer residences at Andrews Point and at the South.
End and Headlands. There are large granite quarries along the coast, especially in Pigeon Cove, and there are two varieties of granite, called commercially "grey" and "green," both very hard, the former the more abundant. It has been used in building the great breakwater off Sandy Bay and various large bridges. Granite for paving-stones is quarried. Like many of the marble quarries those of Rockport owe their development to their nearness to deep water transportation. Isinglass, glue, tools, parts for automobile engines, and copper plate are among the manufactures. Fishing was formerly of importance, but quarrying has displaced it. Sandy Bay, the fifth parish of Gloucester, first settled about 1697, and Pigeon Cove, part of the third parish, were set off from Gloucester and were incorporated as the township of Rockport in 1840. The Bennett & Mackay transatlantic commercial cable was landed in Rockport in May 1884.

ROCKVILLE, a town of Tolland county, Connecticut, U.S.A., in the N.E. part of the state, on the Hockanum river, about 15 m. N.E. of Hartford. Pop. (1890) 7777; (1900) 7287, of whom 2588 were foreign-born, many being Germans and Poles; (1910) 7977. It is served by the New York, New Haven & Hartford railway and by electric lines. It is in the township of Vernon (pop. in 1890, 8980; in 1910, 9097; area, 19 sq. m.), which was separated from Hartford town in 1808, and contains the villages of Vernon, Vernon Centre, Dobsonville and Talcottville. In the city are the George Maxwell Memorial Library and the Sykes Manual Training School. The river, by a series of falls, makes a descent of 280 ft. here, and furnishes power for large manufacturing establishments. The principal manufactures are woolen, silk and cotton goods, envelopes, and silk fish-lines. In 1841 fancy cassimieres, probably the first manufactured in the United States, were made here. At the Hockanum Mills (established 1809) worsted for men's clothing was first made (about 1870) in the United States. The first settlement here was made about 1726. Rockville was chartered as a city in 1889.

ROCKY MOUNTAIN GOAT, or WHITE GOAT (Oreamnus montanus), a North American hollow-horned ruminant of the family Bovidae, distinguished by its white colour. It is, in fact, the only ruminant, with the exception of the white Alaskan wild sheep, which is entirely white at all seasons of the year, and cannot, therefore, be mistaken for any other animal, and its description may consequently be brief. In the winter coat the hair is long and pendent, elongated into a short beard on the sides of the lower jaw behind the chin; and it is also longer than elsewhere on the neck and the chest; at the base of the long hair is a thick growth of short and woolly under-fur. In summer the coat becomes comparatively short. The muzzle is hairy, the ears are of moderate size, and the tail is short, and partially buried among the long hair of the rump. There are no glands on the face; but there is a large globular one at the base of each horn of the size of half a small orange. The black horns, which are ringed in their basal portion, are comparatively short and not unlike those of the Asiatic serows in general characters, being subcylindrical, and curving slightly backwards. They taper, however, much more rapidly than those of the serows, and diverge much more widely from the middle line. The lateral hoofs are well developed. Although commonly described as white, the hair has a more or less decided tinge of yellow, which appears to be more marked in the summer than in the winter coat. The cannon-bones are remarkably short and wide, and in this respect differ from those of all allied ruminants, except the Tibetan takin. The general shape of the animal is ungainly, owing to a huge hump on the withers, at which point the height is about 3 ft.

The head of a white goat obtained in 1900 from the mountains at the mouth of Copper river, opposite Kyak Island, has been described as a species apart. In addition to certain details in the conformation of the skull, the horns are much more slender than in the ordinary white goat, and instead of bending regularly backwards till near their tips, curve widely outwards from their bases. Their length is nearly equal to that of the longest pair of the ordinary form hitherto recorded, while the tip-to-tip interval is nearly double that of any other known specimen. This animal can scarcely be regarded as more than a local race, and should be styled Oreamnus montanus kennedyi.

The affinities of the white goat (which is really a member of a group intermediate between goats and antelopes) are probably with the Asiatic serows and takin, and hence perhaps with the musk-ox.

ROCOCO, or ROCAILLE, literally "rock-work," a style of architectural and mobiliary decoration popular throughout the greater part of Europe during the first half of the 18th century. In France it was especially characteristic of the regency and the reign of Louis XV. A debased style at the best, essentially fantastic and bizarre, it ended in extravagance and decadence. A meaninglessness mixture of imitation rock-work, shells, scrolls and foliage, the word came eventually to be applied to anything extravagant, flamboyant or tasteless in art or literature. The very exuberance of the rococo forms is, indeed, the negation of art, which is based upon restraint. There is something fundamentally Italian in the "brutura" upon which the rococo style is based; and Italy has produced some of the worst examples of what in that country is called the "Jesuit style," in allusion to the supposed lack of directness in Jesuit policy. Everything, indeed, in the rococo manner is involved and tortured, though before a superb example of Jacques Cassiéri, such as the famous commode in the Wallace Collection, it is impossible not to admire the art with which genius can treat even the defects and weaknesses of a peculiarly mannered fashion. The best French work possesses a balance and symmetry which are usually entirely absent from its imitations. Spain and Italy produced many monstrous travesties—it is impossible to imagine anything more grotesque than the flamboyant convolutions of the monumental Roman style of the third quarter of the 18th century. In Germany, weak and lifeless imitations were as popular as might be imagined in a land which was content to take its art, especially its bad art, from France. England did not escape the infection, and Chipendale and his school produced examples of rococo work and coquillage which were quite foreign to their own sentiment, and rarely rose above respectable mediocrity.

ROCROI, a town of northern France, capital of an arrondissement in the department of Ardennes, 22 m. N.N.W. of Charleville by rail, and within 2 m. of the Belgian frontier. Pop. (1906) town, 706; commune, 2116. As a fortified place it commands the Ardennes plateau between the valley of the Meuse and the head-waters of the Oise. The present fortifications, constructed by Vauban, form a pentagon and entirely close in the town, which has regularly built streets converging on a central square. Overlooking the latter is the church, a florid building of the 18th century. Rocroi is the seat of a sub-prefect and has a tribunal of first instance.

The place, originally called Croix-de-Rau or Rao Croix, was fortified in the 16th century and besieged by the imperialists in 1555. Invested by the Spaniards in 1643, it was relieved by Louis II, the duke of Enghien (afterwards the Great Condé), after a brilliant victory. Captured in 1658 by the same duke, then in the Spanish service, it was not restored to France till the treaty of the Pyrenees in 1659. In 1815 Rocroi was besieged for a month by the allies.

RÔD, ÉDOUARD (1837–1910), French-Swiss novelist, was born at Nyon, in Switzerland, on the 31st of March 1837. He studied at Lausanne and Berlin, and in 1878 found his way to Paris. In 1881 he dedicated his novel, Palmyre Vendard, to Zola, of whom he was at this period of his career a faithful disciple. A series of novels of similar tendency followed. In 1884 he became editor of the Revue contemporaine, and in 1887 succeeded Marc Monnier as professor of comparative literature at Geneva, where he remained till 1893. La Course à la mort (1885) marks a turning-point in his career; in it he
forsok the so-called naturalistic novel for the analysis of moral motives. He is at his best in presenting cases of conscience, the struggle between passion and duty, and the virtues of resignation. *Le Sens de la vie* (1880), one of his most famous books, is in the nature of a complement to *La Course à la mort.* It was followed by *Les Trois cours* (1890), *La Sacrificée* (1892), *La Vie privée de Michel Teissier* (1893), translated as *The Private Life of an Eminent Politician* (1893); *La Seconde Vie de Michel Teissier* (1894), *Le Silence* (1894), *Les Roches blanches* (1895), *Le Dernier Refuge* (1896), *Le Ménage du passeur Naudet* (1898), a study of Protestant France; *L'Eau courante* (1902), *L'Indulire* (1903), *Un Vainqueur* (1904), *L'Indicele* (1905), and *L'Incendie* (1906). M. Rod's books of literary criticism include *Les Idées morales du temps présent* (1879), an admirable *Essais sur Goethe* (1890), *Stendhal* (1895), and some columns of collected essays. He published *L'Agafier J. J. Rousseau* in 1906, and in the same year he drew from a student of the philosophical thinker in three acts, *Le Réformateur,* which was produced at the Nouveau Théâtre. He died in January 1910.

RODBERTUS, KARL JOHANN (1805-1875), German socialist, was born at Greifswald on the 18th of August 1805, his father being a professor at the university there. He studied law at Göttingen and Berlin, thereafter engaging in various legal occupations, and, after travelling for some time, he bought the estate of Jagetzow in Pomerania, whence his name of Rodbertus-Jagetzow. In 1836 he settled on this estate, and henceforward devoted his life chiefly to economic and other studies, taking also some interest in local and provincial affairs. After the revolution of March 1848 Rodbertus was elected member of the Prussian national assembly, in which body he belonged to the left centre; and for fourteen days he filled the post of minister of public worship and education. He sat for Berlin in the second chamber of 1849, and moved the adoption of the Frankfort imperial constitution, which was carried. When the system of dividing the Prussian electorate into three classes was adopted, Rodbertus recommended abstention from voting. His only subsequent appearance in public life was his candidature for the first North German diet, in which he was defeated. His correspondence with Lassalle was an interesting feature of his life. At one time Rodbertus had some intention of forming a "social party" with the help of the conservative socialist Rudolf Meyer and of W. Hasenclever, a prominent follower of Lassalle; but no progress was made in this. Rodbertus was neither disposed nor qualified to be an agitator, being a man of a quiet and critical temperament, who believed that society could not be improved by violent changes, but by a long and gradual course of development. He warned the working men of Germany against connecting themselves with any political party, enjoining them to be a "social party" pure and simple. He died on the 8th of December 1875.

The general position of Rodbertus was "social, monarchial and national." He held the purely economic part of the creed of the German social-democratic party, but he did not agree with their methods, and had no liking for the productive associations with state help of Lassalle. He regarded a socialist republic as a possible thing, but he cordially accepted the monarchial institution in his own country and hoped that a German emperor might underlie the whole.
hoofed) feet, clavicles or collar-bones (occasionally imperfect or rudimentary), no canine teeth, and a single pair of lower incisors, opposed by only one similar and functional pair in the upper jaw.

In all rodents the upper incisors resemble the lower ones in growing uninterruptedly from persistent pulps, and (except in the hare group, Duplicidentata) agree with them in number. The premolars and molars may be rooted or rootless, with tuberculated or laminated crowns, and are arranged in an unbroken series. The orbits are always open behind, never being surrounded by bone. The condyle of the lower jaw is antero-posteriorly elongated. The intestine (except in the dormice or Gliridae) has a large cæcum. The testes are inguinal or abdominal. The uterus is two-horned, with the cornua opening separately into the vagina or uniting to form a corpus suteri. The placenta is discoidal and deciduate. And the smooth hemispheres of the brain do not extend backwards so as to cover any part of the cerebellum.

Rodents include by far the greater number of species, and have the widest distribution, of any of the orders of terrestrial mammals, being in fact cosmopolitan, although more abundant in some parts, as South America, which may be considered their headquarters, than in others, as in Australasia and Madagascar, where they are represented only by members of the mouse-group, or Myoida.

All rodents are vegetable-feeders, and this uniformity in their food and in the mode of obtaining it, namely by gnawing, has led to that general uniformity in structure observable throughout the group; a feature which renders their classification difficult. Indeed, despite the fact that they present much diversity of habit—some being arboreal, as the squirrels, many of which are provided with expansions of skin or parachutes on which they glide from tree to tree; some cursorial, as the hares; others jumpers, as the jerboas; others fossorial, as the mole-rats; and others aquatic, as the beavers and water-rats—no important structural modifications are correlated with such diversity of habit.

Anatomy.—The rodent skull is characterized by the great size of the premaxillae, which completely separate the nasals from the maxillae; by the presence of zygomatic arches; and by the wide space existing between the incisors and the cheek-teeth; and (except in the Duplicidentata) by the antero-posteriorly elongated genoid cavity for the articulation of the lower jaw. Post-orbital processes of the frontal bones in squirrels, marmots and hares; but in all other genera they are rudimentary or altogether absent; and the zygomatic seldom sends upwards a corresponding process, so that the orbit is more or less completely continuous with the temporal fossa. The lachrymal foramen is always present in the orbit, in many species the infra-orbital foramen is very large (in some, as in the rat) and transmits part of the masseter muscle. The zygomatic arch is variously developed; the position of the jugal is a character for grouping the families. The nasals are, with few exceptions, large, and extend far forwards, the parietals are moderate, and there is generally a distinct interparietal. The palate is narrow from before backwards, this being especially the case in the hares, where it is reduced to a mere bridge between the premolars; in others, as in the rodent-moles (Bathyerginae), it is extremely narrow transversely, its width being less than that of one of the molar teeth. Tympanic bullae are always present and generally large; in some genera, as in the gerbils (Gerbillinae) and jerboas (Jaculidae), there are supplemental mastoid bullae which form great hemispherical bony swellings at the back of the skull (fig. 1, Pr). In these genera and the hares the meatus auditorius is tubular and directed upwards and backwards. The lower jaw is characterized by its abruptly narrowed and rounded front part supporting the pair of large incisors, as well as by the small size of the coronoid process, and the great development of the lower hind, or angular, portion.

The dental formula varies from $I. c. p. m$, in the hare and rabbits to $I. c. p. m$ (total 28) in the hares and rabbits to $I. c. p. m$ (total 12) in the Australasian water-rats; but in the great majority of species it presents striking uniformity, and may be set down typically as $I. c. p. m$.

In the Duplicidentata only there is more than a single pair of incisors, and in these the additional pair is small and placed behind the middle pair. In this group the enamel extends partly to the back of the incisor, but in all the rest it is restricted to the front surface so that, by the more rapid wear-away of the softer structures behind, a chisel-shaped edge is maintained. Both upper and lower incisors are regularly curved, the upper ones slightly more so than the lower; and, their growth being continuous, the reduced and anachronistic normal wear by which their length is regulated—as by the loss of one of them, or by displacement owing to a broken jaw or other cause—the unopposed incisor may gradually curve upon itself until a complete circle or more has been formed, the incisors sometimes passing through some part of the animal’s head. The cheek-teeth may be either rooted or rootless, and either cusped or formed of parallel plates, this diversity of structure often occurring in the same family. When there are more than three cheek-teeth, those which precede the last three milk-teeth, and are premolars. In some genera, as in the agoutis (Dasyproctidae), these milk-teeth are long retained, while in the allied cavies (Caviidae) they are shed before birth.

The tongue presents little variability in length, being short and compressed, with a blunt tip, which is never protruded beyond the incisors. In most species there are three circumvallate papillae at the base, and the apical portion is generally covered with small thread-like papillae, some of which in the porcupines become greatly enlarged, forming toothed spines. The stomach varies in form from the simple oval bag of the squirrels to the complex ruminant-like organ of the lemmings. In the water-rat and agoutis it is constricted between the esophagus and pylorus; while in the dormouse the esophagus immediately before entering the stomach is much dilated, forming a large egg-shaped bag with thickened glandular walls; and in certain other species, as in Lophiomys and the beaver, glandular masses are attached to and open into the fore-gastric pouches. All rodents, with the sole exception of the dormouse, have a caecum, often of great length and sacculated, as in hares, the water-rat and porcupines; and the long colon in some, as the hamster and water-rat, is spirally twisted upon itself near the commencement. The liver is divided in the typical manner (p. 92), but the lobes are variously subdivided in different species (in Capromys they are divided into minute lobules); and the gall-bladder, though present in most, is absent in a few. In most species the penis (which is generally provided with a bone) may be more or less completely retracted within the body and surrounding the vent, and lie curved backwards upon itself under cover of the integument, or it may be carried forward some distance in front of the anal orifice, from which, as in voles and marmots,
in the breeding-season, it is separated by the prominent testicular mass. The testes in the pairing-season form projections in the groins, but (except in the Duplicidentata) do not completely leave the cavity of the abdomen. Prostate glands and, except in the Duplicidentata, vesiculæ seminales are present in all. The ovary in the female consists of a series of ova or a common vagina, as in Leporidae, Sciuridae, and Hydrochoerus, or two-horned, as in most species. The teats vary in number from a single abdominal pair in the guinea-pig to six thoraco-abdominal pairs in the hare; in the Sciuridae and Cynomys they are placed high up on the sides of the body.

There are generally nineteen dorso-lumbar vertebrae (thirteen thoracic and six lumbar), the form of which varies in different genera; in the curvicular and leaping species the lumbar vertebrae are generally shorter and the bodies longer in the hares there are large compressed inferior spines, or hypapophyses. The caudal vertebrae vary from a rudimentary condition in the guinea-pig to a great size in the jumping-hare and prehensile-tailed porcupines. The scapula is usually present, along with the glenoid cavity, and in the hares and rats and hares they are united, often high up. The hind foot is more variable than the front one, the digits varying in number from five, as in squirrels and rats, to four, as in hares, or even three, as in the capybara, vischacha and agouti; in the hares the hind foot is also long, and in some of the species, as jerboas, they are welded together.

The mouth is divided into two cavities communicating by a narrow orifice, the anterior one containing the incisors and the posterior pair of molars. The upper incisors have the incisive border entirely united; in the hares and hamsters, there are large internal cheek-pouches lined with hair, which open along the angles of the mouth and extend backwards behind the ears. In the New World pouched rats (Geomyidae) the pouches open externally on the cheek, and the muscles evolved by many rodents is due to the specializations of secretions, which may open into the prepuce, as in Mys, Microtus and Cricetus, or into the rectum, as in Arctomys and Thryonomyx, or into the passage common to both, as in the beavers. The pouches open near the vent, as in hares, agoutis and jerboas.

The skin is generally thin, and the panniculus carnosus muscle rarely much developed. The fur varies exceedingly in character,—in some species it is very short, silky and harsh, while in others it is more or less replaced by spines on the upper surface, as in spiny rats and porcupines; these spines in several genera, as Xerus, Acomys, Platagomys, Echinosorex, Loncheræs and Echinops, become much stronger and more peculiarly noticeable in the comparatively small size of the temporal muscles, and in the great double scamasters (fig. 2), which are the principal agents in gnawing. The digastric muscles are also remarkable for their well-defined central tendon, and in many species their anterior bellies are united between the two branches of the lower jaw. The clido-mastoid generally arises from the basi-occipital, and the pectoralis major is connected with the latissimus dorsi. In porcupines and hares the tendons of the belly muscles are long, and from the length of the short belly, and in the foot, while in the rats and squirrels they are separate, and the flexor digitorum longus is generally inserted into the metatarsal of the first toe.

Classification.—Some diversity of view obtains among naturalists with regard to the classification of the order; the scheme here followed being the one adopted (with some modifications of nomenclature) by Professor Max Weber in his Stuge-thiere. The number of genera is so great that only the more important can be noticed. All authorities are agreed in dividing rodents into two great sections or sub-orders, the one, Duplicidentata, comprising only the hares, rabbits and piques, and the other, Simplipidetata, all the rest. In the latter there is only one pair of incisor teeth in the upper jaw, in which the enamel is confined to the front surface. The incisive foramina of the palate are moderate and distinct; the fibula does not articulate with the calcaneum; and the testes are abdominal, and descend periodically only into the inguinal canal.

Sewellels.—The first family is represented by certain peculiar North American rodents known as sewellels, constituting the genus Haplodon or Apodon and the family Haplodontidae and section Haplodontoidea. In common with the next three sections these rodents have the angular processes of the lower jaw (fig. 4) arising from the inferior surface of the socket of the incisor. The masticatory muscle does not pass through the narrow infra-orbital canal. An alisphenoid canal may be present on the palatal aspect of the skull; but there is always a transverse canal. The malleus and incus of the inner ear are separate. The humerus has often a foramen (entepicondylar) on the inner side of its head; the elbows and feet may be separate or united; but the scapular and lunar of the carpus are also united, while the centrale is free. The stomach is simple.

Sewellels are medium-sized terrestrial rodents, with no post-orbital processes to the skull, which is depressed in form, and none less cheek-teeth, among which the premolars number 7, the first in the upper jaw being very small. The build is stout and heavy. The limbs and tail are short, the ears moderate, the eyes minute and the feet too-foetid and plantigrade. Haplodon is represented by a small number of species in America west of the Rocky Mountains, of which H. rufus is the longest known. They are burrowing, and, in some cases at any rate, partially aquatic rodents.

Squirrel Group—The Sciuridae, which include the great group of squirrels, sows, lemmings, and arctomys, &c., all comprised in the single family Sciuridae, differ from the sewellels in having large post-orbital processes to the skull (figs. 4, 5, 6); and, with one exception, have rooted cheek-teeth, the premolar-formula being 2,1,2,3. The infra-orbital foramen is also narrower, and the tympanic bulla is larger. In the families of the North American hare and the squirrel family the zygomatic process has its front border oblique. According to modern views the sub-family is broken up into a large number of genera.

The first of these is Rhithrogena, represented by one large species (R. notatus) from Borneo, characterized by its finely grooved incisors (see Groove-Toothed Squirrel). The second genus, Heliosciurus, includes arboreal African squirrels, typified by Heliosciurus stranei, allied in the characters of their skulls to the undermentioned Xerus, and with a very large pre-orbital foramen in the more typical forms. The third, Funisciurus, of which F. pyrophorus is a well-known example, is also African and allied to Xerus, but has a shorter and less well-developed skull. In Xerus itself, which is represented by the terrestrial African spiny squirrels, the ears are short, there are only two teats, and flat spines are mingled with the fur; while the skull, and more especially the frontals, is strongly elevated, with a very short post-orbital process, and the crowns of the molars are taller than usual (see Spiny Squirrel). The well-known Indian palm-squirrel, Funambulus palmarum, is an Indo-Malay genus allied to Xerus in skull-characteristics but with longer ears. In the use of Sciuridae the common striped species are the giant squirrels of the same region, such as Ratufa indica and R. bicolor, which are very brightly coloured rodents, with Sciurus-like skulls (fig. 5) but extremely short spines, or large molar, and only one pair of upper premolars. Next comes the typical Sciurus, consisting the great bulk of the entire group, and ranging over Europe, Asia, North Africa and America. The skull is short and broad, especially as regards the frontals, with large post-orbital processes (fig. 5), and very generally two upper premolars, making a total of five pairs of upper cheek-teeth, which have crowns of medium height. The teats are either four or six. Squirrels of this and the other arboreal groups have the bodily form slender and agile, the tail long and bushy, the ears well developed, pointed and often tufted; the feet adapted for...
RODENTIA

Incisors haired represented along vertical, pair dormice and members parallel, from the same central channel; the tail is transversely flattened and naked; and the hind-feet are webbed (see BEAVERS).

The second section, Castoridae, of the present group includes only the family Castoridae, represented by the beavers, which are large aquatic rodents characterized by their massive skulls, devoid of post-orbital processes, with the angle of the lower jaw rounded, the molars rooted, semi-rooted, or rootless, and enamel-folds, and one pair of premolars above and below. The tibia and fibula are united inferiorly, the tympanic bulla is hollow and the infra orbital foramen narrow. The single existing genus comprises the European Castor fiber and Northern Asia, and the North American C. canadensis. The upper molars are subequal, each with one internal and two external enamel-folds; the stomach has a large glandular mass situated to the right of the oesophageal orifice; the anal and urino-genital orifices are within a common channel; the tail is transversely flattened and naked; and the hind-feet are webbed (see BEAVERS).

The third section, Castoridae, includes the American beaver, or pocket-cougers, and is represented by the genera Castor, Tamias, and Sciurotamias, and the following species:

- Castor canadensis: the American beaver, or pocket-couger, is characterized by its large size, elongated body, long tail, and webbed hind-feet. It is found in North America, particularly in the eastern United States.
- Tamias minimus: the American pocket-gopher is found in North America, particularly in the western United States.
- Sciurotamias aberti: the Ord's pocket-gopher is found in the southwestern United States.

The fourth section, Castoridae, includes the genera Heteromys and Perognathus, and the following species:

- Heteromys flavipes: the yellow-footed pocket mouse is found in North America, particularly in the western United States.
- Perognathus longimembris: the long-legged pocket mouse is found in North America, particularly in the western United States.

The fifth section, Castoridae, includes the genera Thomomys and Eutamias, and the following species:

- Thomomys talpoides: the plains pocket mouse is found in North America, particularly in the central and eastern United States.
- Eutamias mexicanus: the dusky-footed wood rat is found in North America, particularly in the western United States.

The sixth section, Castoridae, includes the genera Ctenodactylus and Peromyscus, and the following species:

- Ctenodactylus townsendii: the townsend's pocket mouse is found in North America, particularly in the western United States.
- Peromyscus leucopus: the deer mouse is found in North America, particularly in the eastern United States.

The seventh section, Castoridae, includes the genera Perognathus and Thomomys, and the following species:

- Perognathus longimembris: the long-legged pocket mouse is found in North America, particularly in the western United States.
- Thomomys talpoides: the plains pocket mouse is found in North America, particularly in the central and eastern United States.

The eighth section, Castoridae, includes the genera Eutamias and Thomomys, and the following species:

- Eutamias alnocola: the golden-mantled ground squirrel is found in North America, particularly in the western United States.
- Thomomys talpoides: the plains pocket mouse is found in North America, particularly in the central and eastern United States.

The ninth section, Castoridae, includes the genera Castor and Tamias, and the following species:

- Castor canadensis: the American beaver, or pocket-couger, is characterized by its large size, elongated body, long tail, and webbed hind-feet. It is found in North America, particularly in the eastern United States.
- Tamias minimus: the American pocket-gopher is found in North America, particularly in the western United States.

The tenth section, Castoridae, includes the genera Castor and Tamias, and the following species:

- Castor canadensis: the American beaver, or pocket-couger, is characterized by its large size, elongated body, long tail, and webbed hind-feet. It is found in North America, particularly in the eastern United States.
- Tamias minimus: the American pocket-gopher is found in North America, particularly in the western United States.

The eleventh section, Castoridae, includes the genera Castor and Tamias, and the following species:

- Castor canadensis: the American beaver, or pocket-couger, is characterized by its large size, elongated body, long tail, and webbed hind-feet. It is found in North America, particularly in the eastern United States.
- Tamias minimus: the American pocket-gopher is found in North America, particularly in the western United States.

The twelfth section, Castoridae, includes the genera Castor and Tamias, and the following species:

- Castor canadensis: the American beaver, or pocket-couger, is characterized by its large size, elongated body, long tail, and webbed hind-feet. It is found in North America, particularly in the eastern United States.
- Tamias minimus: the American pocket-gopher is found in North America, particularly in the western United States.
Dormice.—The next three sections of the order, namely, the Myoxoidea, or dormice, Dipodoidea, or jerboas, and Muroidea, or the mouse group, have the following characteristics in common. The angular process of the lower jaw has the same relations as in the serevals and the allied groups. The lachrymal foramen in the skull is low down and forms an elongated slit. In the carpus the scaphoid and lunar are welded, but the centrae remain distinct. The tibia and fibula are fused at their upper and lower ends. The malleus and incus of the inner ear are separate. Except in Lepiomys, the clavicles are complete. The infra-orbital foramen of the skull (fig. 9) is more or less broad; and there is generally a transverse canal. The snout is generally complex.

In the dormice, forming the section Myoxidae, the skull of the typical sub-family Glirinae, the first is Glist (or Glist vulgaris) of Europe, with a doubly vaned, bushy tail, simple stomach, and large molars with well-marked enamel-folds; the second, Muscardinus, with M. asellarius, the common dormouse, distinguished by the cylindrical bushy tail, and thickened glandular walls of the cardiac extremity of the esophagus; thirdly, Eulomys, containing several species, with tufted and doubly vaned tails, simple stomachs and smaller molar teeth, having coracoid crowns and faintly marked enamel-folds; and lastly, the African Graphiurus, represented by several species, with short cylindrical tails ending in a pencil of hair, and very small molars almost without trace of enamel-folds. None of the members of the typical sub-family extend into India, where the group is represented by Platanocanomys, typifying the sub-family Platanacanthymyinae, characterized by the absence of premolars; the other being the Chinese Typhonomys. These are small rodents with somewhat the appearance of the pigmy squirrels (Nannosciurus), which in some degree connect the family with the Muridae. (See DORMOUSE.)

Jerboa Group.—The Dipodoidea, or jerboa-group, which likewise includes only a single family, Jaculidae (or Dipodiidae), is characterized by the presence of not more than one pair of premolars in the upper jaw, which, however, may be wanting; by the rooted cheek-teeth, which have transverse enamel-folds, and the absence of a transverse canal in the skull, and of a horny layer in the stomach. The family is divisible into two sub-families, of which the first, or Smithininae, is represented by only the genus Sminthos, containing a few species which range from Denmark into Western Asia, Kashmir and China. They are small rat-like rodents, with one pair of upper premolars, which are mere cusps, as is the last molar, and the two pairs of limbs of normal length, with the metatarsals separate; the infra-orbital opening in the skull being triangular and widest below, while the incisive foramina in the palate are elongated. The European S. subtilis has a black dorsal stripe bordered with yellow.

The Dipodidae, on the other hand, are leaping rodents, with the metatarsals elongated, a small upper premolar present or absent, and the crowns of the molars tall. Various degrees of specialization occur in the adaptation for leaping. The least specialized genus is Zapus, containing the jumping-mice of North America, with one outlying Siberian species, in which the five metatarsals are free, as are also the cervical vertebrae, the small upper premolar being retained. (See JUMPING-MOUSE.)

In the other genera, so far as known, the three central metatarsals of the hind foot are fused into a cannon-bone, of a type unique among mammals and comparable to that of birds. Some of the central vertebræ are also united in at least the better-known genera. The tail and ears are generally very long; while, in correlation with the size of the latter, the auditory bullae of the skull are also large. The tympanic bullae of the skull are very large. It is bounded by Audacturus, ranging over Russia and Western and Central Asia, inclusive of Persia and Baluchistan, with smaller ears and a shorter nose; by some naturalists it is taken to include the North African D. boehmi, the size of which is intermediate between Audacturus and Scarturus. The Turkistan Platycercovus (or Pygeretmus) has a lancet-shaped tail and no premolars; while Cardiocranus of the Nan-shan district of Central Asia has a similar type of tail, but short ears and a peculiarly triangular skull. (See JERBOA.)

Mole-Rats.—The mole-rats (Spalacidae) bring us to the mouse-like section, or Myoxidea, in which there are no premolars and the molars may be occasionally reduced to 4, these teeth being either rooted or rootless, with either cusps or enamel-folds, and the first generally larger than the second. In the skull the vomerine arch is slenderer and the jugal bone smaller and not extending far forwards, being supported by the long zygo-matic process of the maxilla, while the infra-orbital foramen is mostly large, and there are no post-orbital processes. Although sometimes short, the tail is generally long, sparsely hairied and scaly. The cardiac portion of the complex stomach has a horny layer, and there is a caecum.

The Spalacidae are burrowing types, allied apparently to the ancestral Jaculidae, and characterized by the second and third molars being equal in size, the presence of enamel-folds in all these teeth, and the superiority in size of the claws of the second, third and fourth front toes over the other two. All these rodents are thoroughly adapted to a subterranean life, the eyes and ears being small and rudimentary, as is also the tail; while the body form is cylindrical, and the front claws are very large and powerful. The incisors are very large; and the palate of the skull is narrow. The typical representative of the group is the great mole-rat (Spalax typhlus) of Eastern Europe and North-East Africa, which, together with a few closely allied species, has the eyes completely buried in the skin, and the head much flattened.
RODENTIA

In the bamboo-rats, *Rhizomys*, from the Indo-Malay countries, China and Tibet, as well as in the closely allied East African *Tachyoryctes*, the eyes are, however, functional, and the head is rounded. (See MOLE-RAT.)

According to the arrangement here followed, the burrowing zokors may be placed in this family, although they have teeth like those of the vole group in the Muridae. The first representative of this sub-group is the genus *Stenomys* (or *Myotila*), of which some five Central and North Asian species are known. They are characterized by the mole-like form and long, powerful, front claws (fig. 10). In the true zokors (*Ellobius*), on the other hand, the claws are short and the general form more vole-like. Of three named species, one extends from South Russia to Siberia, while two others are respectively from Kurdistan and adjacent regions in Persia, Macrotarsomys, from the Caucasus, is represented by a species of the size of a small water-rat, chestnut-brown in colour, with lighter feet, and the minute eyes covered with skin. The teeth are nearest to those of the true zokors (*Ellobius*). The single example is taken under the heading of rodents.

**Malagasy Rats.**—On account of certain structural peculiarities, the rats of Madagascar, which have a denticion like that of the criquetine Muridae, are separated as a distinct family, Nesomyidae. They are the only rodents in that island. Of these, *Hypogeomys* is a large, long-tailed, fawn-coloured rat, with large ears and feet; *Nesomys* is a red species, with long hair; *Brachyxomys* is short-footed and long-tailed, with velvety fawn fur; *Hallomys* has elongated hind feet, as has also *Macrotarsomys*. *Gymnomys* is naked-tailed; and the several species of *Elitur* are dormouse-like.

**Mouse Tribe.**—The characteristics of the Muridae are those of the Myoidae generally, as given above under the heading of the Spalacidae. With the exception of Madagascar, the family, which may be divided into six sub-families, has a cosmopolitan distribution, and the genera are so numerous that only some of the most important can be even mentioned.

The first group is that of the hamsters, or cricetines (*Cricetinae*), in which the molars are rooted and tuberculated, with the cusps of the upper ones arranged in two longitudinal rows (fig. 13, B); in the upper teeth the outer cusps and in the lower the inner ones are the higher, and when worn the crown surfaces show oblique dentine-areas; in shape the third molar is like the second, but it is smaller. The infra-orbital foramen is generally narrower, and the tympanic bullae hollow. The humerus has a foramen at the lower end. The tail is short. The group is typified by the European hamster (*Cricetus vulgaris* or *C. cricetus*), to which a separate article is devoted (see HAMSTER); the genus includes a number of species ranged under several sub-generic genera, such as *Mesocricetus*, *Cricetulus*, and *Urocricetus*, widely spread in Western and Central Asia, the last-mentioned, which is from Tibet, being distinguished by its relatively long tail. The hamsters all possess cheek-pouches, which are, however, absent in many of the following genera. Africa claims only a single representative of the group, *Mystromys*, with one southern and one eastern species. Persia is the home of *Calomys* (with one species), a near relative of the American *Peromyscus*. In America, where the more typical kinds are known as white-footed, or deer, mice, the cricetines absolutely swarm, and include a host of genera, the majority of which are North American, although others are peculiar to Central and South America. Among these may be named *Oxymys*, *Peromyscus*, *Eomys*, *Holochilus* (which is South American and includes the largest species), *Sigmodon* (typified by the North American rice-rat, *S. hispidus*), *Oryzomys*, *Rhizomys* (with grooved incisors), *Icthyomys* and *Anotomys* (fish-eating, aquatic forms, from the mountains of South America), *Acomys*, and the North American wood-rats, or *Neotoma*, in which the molars have a structure simulating that of the under-mentioned Microtinae. A distinct sub-family, Lophiomynae, is represented by the Central American arboreal spiny rats, *Lophiomys*, of which there are two or three species. Although agreeing with the Cricetinae in the hollow tympanic bullae, they have the clavicles imperfect, the first front toe opposable to the rest, the temporal region of the skull roofed with bone, and the crowns of the molars with cusps arranged in rows but eventually covered by a layer of enamel.

The third sub-family is that of the Microtinae, or voles, which are distributed all over Europe, North America, and Madagascar, and are characterized by the tympanic bulla of the skull being filled with honey-combed bony tissue, the small size of the infra-orbital foramen, and the deep pterygoid fossa on the palatal aspect. The humerus lacks a foramen at the lower end; and the molar teeth, as explained and illustrated in the article VOLE (q.v.), consist of two longitudinal rows of triangular alternating vertical prisms, and may be either rootless or rooted. Voles, as typified by the water-rat and the tailed fieldmouse, are stouter, smaller than the usual rats, with smaller ears and eyes and shorter tails; all being good burrowers. In the circumpolar *Enomys* (represented in England by the red-backed field-mouse) and the nearest allied North American *Phenacomys*, the molars develop two rootless in old age; but in *Microtus* (which includes the water-rat, and is circumpolar) they are rootless throughout life, the genus being one of the largest in the mammalian class (see VOLE). *Fiber*—the muskrat— is a North American aquatic type (see MUSKRAT), characterized by the compression of the tail. *Synaptomys* is also North American, and characterized by the grooved upper incisors and the presence of distinct enamel-loops on the outer side of the lower molars. The circumpolar lemmings of the genera *Lemmus* and *Dicrostonyx* are noted in the article LEMMING. *Ellobius*, which many naturalists place in this group, has been mentioned among the Spalacidae.

**Fig. 10.**—The Tibetan Zokor (*Stenomys armandi*). From Milne-Edwards.

**Fig. 11.**—American Spiny Rat (*Lophiomys imhausi*). After Gould.

**Fig. 12.**—The Australian Brown-footed Rat (*Mus fuscipes*). From Milne-Edwards.
The typical rats and mice, together with their nearest relatives, constitute the sub-family Murinae, which is represented by more than three hundred species, distributed over the whole of the Old World except Madagascar. The molars (fig. 13, A) are rooted and have a plate-like structure, with the cusps forming the longitudinal rows in those of the upper jaw, but only two distinct ones in the lower. By this structure the Murinae are broadly distinguished from the Cricetinae (fig. 13, B) and the Microtinae. In the skull the tympanic bulla is hollow, the pterygoid fossa shallow and the zygomatic arch slender, with a rudimentary bone. There is long and scaly (fig. 12). The genus Mus, with about a couple of hundred species, includes the true mice and rats (see Mouse and Rat), and has the typical characters of the group; the incisors being narrow and smooth, the molars small, the eyes and ears large and the tip of the muzzle naked. In some cases there may be spines among the fur. None are much larger than the brown rat (M. norvegicus) or smaller than the harvest mouse; and they all have habits generally similar to those of one or other of the English species, although some live in trees like squirrels and lemmings (Mus); among the molars the jumping rat (M. fuscipes) of western and southern Australia (fig. 12). The genus Nesokia is like Mus, but with the incisors and molars broader, and the transverse laminae of the latter more clearly defined. This genus contains a few clumsily built rats spread over the Indo-Malay area (see Bandicoot-Rat). Among other important genera are Eosomys and Pseudomys (both African) stand apart by the possession of cheek-pouches; C. gambianus being a very large animal with cheek pouches, but the Papuan Chiru has the tip of the tail naked above and prehensile. The spiny mice, Acomys (or Acanthomys), of Western Asia, Cyprus and Africa, take their name from the fur being almost entirely replaced by flattened spines, and are further distinguished by the less hairy, uncolored jaw bones. Acomys is an allied African genus; while Arvicanthis includes the African striped mice. Glicinera, from India and Africa, is like Mus, but with grooved upper incisors. Vandelauria, ranging from India to Yunnan, has flat tails of the order of the African mouse, but a very long tail; while the Indo-Malay Chiroptodons has a flat tail on the first toe of both feet and a tufted tail. In the Philippines occur the peculiar genera Batonyms, Carposmys and Crateromys, comprising a number of species of small size and with the upper and lower molars widely separated. The small size and large ear of Mastomys is like Mus, but with the molars remarkably broadened, and with only four teeth. The single species is from Tasmania, though it has been found fossil in New South Wales; it is somewhat similar in size and appearance to the English water-rats but has much softer fur. Uromys differs from Mus in having the scales of the tail not overlapping, but set edge to edge, so as to form a sort of mosaic work. There are several species, spread over the northern part of the Australian region, with a large and more elongated molar. The single species is from Queensland, the River Burdekin, with an extremely elongated muzzle, all the bones of the face being much produced, and the incisors faintly grooved, the only species, E. leucura, being about the size of the common rat, with its fur thickly mixed with spines, a native of Celebes. Australia is the home of the group of jumping species, known as jerboa-rats, characterized by the elongation of the hind limbs, arranged under the genera Notomys, Dipodillus, Amomys and Conilurus, distinguished from one another by the structure of the molars and the number of toes on each foot-pad, the second being further characterized by its long ears.

The large-eared African Oryctomys and the allied Oreomys (Oreomys), often made the type of a distinct sub-family, may be included in this section; as well as the small African tree-mice, Dendromys, allied to Bentor, and to the gerbilline. In the first class has three rows of cusps, the other two having only a couple of such rows, as in cricetines. Other allied African genera are Steatomys and Lophomys, which include several species of small size, usually with a large size, and with spines, though some burrow in cornfields. Here also may be noticed the huge Philippine long-haired rats of the genus Phakomys, characterized by their broad incisors, transversely laminated molars and large claws. There are two species represented as a sub-division of the Australian genera. The skulls, which are widely distributed over the more or less desert-like regions of the Old World exclusive of the Malay countries and Australia, form the sub-family Gerbillinae. They have long hind limbs, large eyes and ears; and in correlation with the latter an enlarged auditory bulla to the skull, which is hollow and divided into a tympanic and a mastoid portion. The tail is generally long and hairy. There are three pairs of rooted molars, whose crowns carry transverse plates, decreasing in number from three in the first to one in the last tooth, with a large number of species, has a range coextensive with that of the sub-family: Pachyromys, with two African species, has a short club-shaped tail and enormous auditory bulla; while the remaining members of the group, which are confined to North Africa, Eastern Europe and Asia, are arranged in the genera Meriones, Psammomys and Rhombomys, the latter represented only by R. opimus from Russia and Central Asia (see Gerbil).

The last representatives of the Muridae are confined to Australia and the Philippines, and constitute the sub-family Hydromyinae, characterized by the very general presence of only two pairs of molars in each jaw. In the typical Australian and Papuan Hydromys, locally known as water-rats, the molars originally have transverse ridges, the enamel folds between which form cutting edges whose sharpness depends upon the degree to which the teeth have been worn, while the large hind feet are webbed. The typical H. chrysogaster is a large brown rat with an orange belly, which feeds on small fishes and insects. Limnomys, from New Guinea, is a type less specialized for swimming, the hind-feet being much less twisted than in Hydromys, and not so fully webbed. Still less specialized are Chromomys and Xeromys, which include Philippine land-rats, while Ctenomys, from the same area, retains the third molars, and thus connects the group with the Murinae.

Finally, the Philippine Rhynchomys is represented by a rat with two pairs of molars and a long shrew-like nose, the zygomatic arch of the skull being also placed unusually far backward.

**Rodentia.**—With the so-called strand-moles of South Africa, forming the section Bathyergoidae, and the family Bathyergidae, which were formerly placed with the Spalacidae, we come to the first of two sections in which the lower jaw has a totally different form to that obtaining in all the preceding groups. In the rodents now to be considered, the angular process of the lower jaw arises from the outer side of the sheath of the incisor. The malleus and incus of the internal ear are united, and there is no transverse canal in the skull. At least one pair of premolars is present in each jaw; and these teeth and the molars typically have one outer and one inner enamel fold. There is no foramen at the lower end of the humerus, and no horny layer in the stomach.

In the Bathyergoidae the scaphoid and lunar of the carpus are separate, the tibia and fibula united and the clavicles normal. The masseter muscle does not pass through the narrow infra-orbital canal, and the temporal muscle is large. All the Bathyergidae are African, and adapted to a burrowing life, having minute ears and eyes, a short tail and the thumb armed with a large claw. The largest species represents the genus Bathyergus, while several smaller kinds are included in Georychus. The former constructs its tunnels in the sandy flats near the shore of the Cape, but the latter generally frequent higher ground. In both genera there is only a single pair of premolars in each jaw, but in the smaller Myoscelopus there are usually three pairs of these teeth. The most remarkable members of the family are the sand-rats of Somaliland and Forskalia, forming the genus Heteroecephalus and Pernaruma, in which the premolars may be reduced to two pairs. They have large heads, minute ears, almost functionless eyes and moderately long tails; the skin, with the exception of a few hairs on the body and fringes on the feet, being naked. They spend their whole time buried in the hot desert sand, in which they conceal themselves (fig. 14).

**Porcupines.**—In the second section, or Hystricoidae, including several families, the skull (fig. 14) is characterized by the heavy
than one pair of premolars, and the original ridges of all the cheek-teeth have become obscured and complicated by the development of secondary enamel-folds. The majority of these rodents, many of which are of large size, are terrestrial, but a few are burrowing, others arboreal and two or three aquatic.

The Old World porcupines, constituting the family Hystricidae, are terrestrial, stoutly built rodents, with limbs of subequal length in front and behind, and the skin covered with strong spines. The upper lip is deft, the jugal lacks an inferior angle, the fore part of the palate is emarginate, and the incisors are usually large and projecting. The skull is massive, and its well-developed tail, the absence of cheek-pouches, the full development of all five toes and the wider thorax. The Capybara may be adopted as the popular title of the species. Dr. E. Goeldi states that the paca-rana is a rodent of phlegmatic and gentle disposition, which are of very large size, and when not alarmed are really very quiet, but when really frightened they are very savage. The Capybara is native to Brazil, inclusive of the headwaters of the Purus, Acre and Jurua rivers. In the true paca-rana the fourth toe is absorbed, the hind-toe being entirely replaced by an expanded toe, forming a very large bony capsule on the sides of the face, enclosing on each side a large cavity lined with mucous membrane internally, and communicating with a small opening with the mouth. Capybara live both in forests and on the banks of rivers (see Paca).

The Agoutis, Dasyproctidae, include several species of slender-limbed rodents, with three hind-toes, inhabiting Central and South America, one (D. cristata) extending into the West Indian islands. The members of both Caviidae and Dasyproctidae have few habits, and have the fore- and hind-limbs subequal, like-clawed, short or obsolete tail and rudimentary clavicles. The alinasi is the lower jaw is obsolete, the palate broad, the incisors long and projecting, and the ears short and boat-shaped. The agoutis have the limbs and ears long and the tail very short.

D. patagonica is a large species, nearly 3 ft. long, inhabiting the grasslands of Patagonia, while D. salinicolor is a much smaller rodent from the salt-lagunas of Argentina. The palate is so much contracted that the premolars are opposite sides sub-dent by their antero-internal edges. Hydrochoerus, in which all the feet are fully webbed, includes a single species, the cappahra, or caprhino, the largest of living rodents. The skull (fig. 14) is distinguished by the presence of a large incisive foramen, and the development of the par-occipital processes and the complex structure and large size of the last molar (see Cavy and Cappahra).

Chinchilla Group.—The family, Chinchillidae, typified by the well-known chinchilla, includes a small number of South American rodents with hind-toes and prominent lateral digits in the hind-foot, elongated hind-limbs, bushy tails, very soft fur and perfect claws. The jaina is without an inferior angle, and extends forwards to the lachrymal; the palate is contracted in front and deeply emarginate behind; the incisors are short, and the molars divided by continuous folds into transverse plates; and the two halves of the lower jaw are welded together in front. It includes three existing genera, represented by some five species. Of the true chinchilla, Chinchilla laniger, C. brunneocauda, Lagidium peruvianum and L. pallipes, are restricted to the alpine zones of the Andes, and the northern boundary of Peru to the southern parts of Chili; while Lagostomus trichodontus (or Viscasia viscacia), the viscacha, is confined to the Pampeans from the Uruguayan border to the Andes. In the viscacha the upper incisors, which are not attached to the premaxillae, are greatly elongated and project far beyond the edges of the mouth. In the hind feet, the fourth small digit is long and bushy and the auditory bullae are large, surmounting on the top of the skull; Lagidium x is four digits in both fore- and hind-feet, and Lagostomus three only in the hind-foot. There is no auditory bulla.

Hutia Group.—The three remaining families of the Hystricocidae, of which one is African while the other two are chiefly South American, are very closely allied and often brigaded in a single genus. The family Hutia, the African hutia, the American and West Indian hutias, the South American coypu and the African cane-rats, the tympanic bulla of the skull is hollow, the par-occipital process straight, the lachrymal small, and the cheek-teeth well-developed, the incisors being entirely absent. Of the few living representatives of the group, the genus Myocastor (or Myopotamus) is represented only by the South American coypu, Myocastor, which is aquatic in its habits, and measures about 2 ft. in length. It has a long tail, brown fur, and red incisors, and lives in burrows near water, feeding on aquatic plants.
The hutia (Capromys pilorides) is nearly as large, arboreal in habits, and a native of Cuba, where it is the largest indigenous mammal. Other species occur in Cuba, Jamaica and the Bahamas, while a Venezuelan species, Procacomys gayi, represents a separate genus. In our eastern United States the family Viverridae is represented by a single species, Mustela erminea, the ermine or stoat, for the manner in which the liver is divided into minute lobules, Platypus aedon, another member of the group, is peculiar to Hayti. The African cane-rats, Thryonomys (or Arvicolus), are large terrestrial rodents, and the common species extends to the Cape, easily recognized by its deeply fluted incisors (see COYPU). The Octodontidae, which are exclusively South American, differ from the preceding family by the tympanic bulla being filled with cellular tissue, the teeth curving beneath it, while the cheek-teeth are almost or completely rootless and composed of parallel plates. The first front tooth may be absent. The more typical members of the family are rat-like burrowing rodents, living in communities. The type genus (Octodontus) has several nearly related species; other genera being Ctenodactylus, Octodontomys (Neotodon), Acanthomys, Spalacopus and Another; the latter taking its name from its unusually soft fur. Among these, the tuco-tucos (Ctenodactylus) are small and don’t seem to move in their burrows, generally formed in sandy soil. In some districts the ground is undermined by these burrows, in which stores of food are accumulated. The species of Oedipus have their roots indented by plates of enamel; they are chiefly found in hedgerows and bushes, where they burrow. In Proctomys the tails have no tuft, the ears are still larger and the lower cheek-teeth more curved. While the family of the tucux (Octodontidae) is small, the genus Pseudomys contains a large number of species. In the enantiornithine order, the family contains a number of genera, completely resembling one another more or less closely in general external characters. In all the forelimbs have five and the hind four digits; and the soles of the feet are densely clothed with hairs similar to those covering the back, excepting the inner surface of the cheeks being hairy. Although most of the genera are closely related, the family contains such a wide distribution, the greater number of species being found in the temperate zones, while the rest are restricted to Europe, northern and central Asia, and North America, South America having very few. Till within the last few years, the majority of naturalists followed the prac-

---

FIG. 16.—Skull of the Common Hare (Lepus europaeus).
If the latter course be followed, Mr Lyon’s general must be reduced to the rank of sub-generic, and his sub-generic divisions of Lepus and Sylvulus ignored. (See Hare and Rabbit.)

**Extinct Rodents**

Among extinct rodents, only a few of the more important types may be noticed. As to the origin of the order, we are still to a great extent in the dark; and even the relations of the Duplicidentata to their relatives are not quite clear. As to the latter point, it is, however, considered probable that both are branches of a common stock, which diverged from each other before all the typical rodent characters were acquired. As to the ancestral group, in the order, it is highly sugescted that it was represented by certain Lower Eocene European and North American mammals, at one time regarded as primitive Primates. In Europe these include Pleistadapis and Protoadapis, and in North America Proloptychus, the Miocene form, and the Miocene genus, representing the family Mixodiactidae. Possibly the European forms, in which the dental formula has been given as $i, s, p, m$, and there is a gap between the incisors and the cheek-teeth, are more nearly related to modern rodents than the American types, and may indeed belong to the same order. On the other hand, the Eocene tridactyl forms, which have one pair of large chisel-like incisors in the lower jaw, also possess a lower canine, and show no marked gap in front of the cheek-teeth, nor any indication of the characteristic rodent backwards movement of the lower jaw when approaching a hand. In the latter ground, admitting that they are allied to the rodents, it has been pointed out that they can scarcely be included in the Rodenticia, and the order Pliocricellinae has in consequence been proposed for their reception. Whatever may be there, the supposed affinities of the anepitelysian mammals, undoubted rodents are known from the Lower Eocene of both Europe and North America. In Europe these forms the genus Ischyromys and the family Ischyromyidae, and have premolars, and, like the lower cheek-teeth, are low-crowned, with both crowns and roots of the latter. Possibly they are akin to the Sciuridae. In America, Paramys, with transversely ridged molars, is allied; and the European Sciurumys should perhaps find a place in the same neighbourhood. A more advanced rodent, described by Dr. Matschie, is represented by the family Oligodontoidea, by the genera Pseudocirus, Sciurorhabdus, Trechomys, Theridomys, &c., in which part of the masseter passes through the infra-oral canal, and the premolars are $i$, the molars being low-crowned, many-rooted and either cusped or ridged. The latter ground, though the same as that of the Pleistadapis, and it is partly on their evidence that the family Pedetidae is placed next the latter. Here it may be mentioned that Lethia, from the Pleistocene of Malta, originally regarded as a giant dormouse, seems nearly akin to the Sciuridae. In the skull, the North American Oligodontoidea approaches to Dipodopodes, while the contemporary Gymnopithecus and Ectypotus likewise appear referable to the Geomyidae. The Upper Oligocene forms of America, and the Miocene genera of the family Mecocricidae, and an important stage in the development of the skull, and the North American Oligodontoidea approaches to Dipodopodes, while the contemporary Gymnopithecus and Ectypotus likewise appear referable to the Geomyidae. The Upper Oligocene forms of America, and the Miocene genera of the family Mecocricidae, and the North American Oligodontoidea approaches to Dipodopodes, while the contemporary Gymnopithecus and Ectypotus likewise appear referable to the Geomyidae.
RODGERS—RODNEY

Rodez, called Segedunum under the Gauls, and Ruthena under the Romans, was the capital of the Rutheni, a tribe allied to the Arverni, and was afterwards the principal town in the district of Rouergue. In the 4th century it adopted the Christian faith, and St Amans, its first bishop, was elected in 411. During his middle ages contests were rife between the bishops, who held the temporal power in the "cité," and the counts in the "bourg." The Albigeens were defeated near Rodez in 1210. The countship of Rodez, detached from that of Alaric, in 1194, was given first to the viscounts of Carlat, and from the beginning of the 14th century to the counts of Armagnac. From 1360 to 1368 the English held the town. After the confiscation of the estates of the Armagnacs in 1438 the country, known as Alençon and the D'Orbئت. Henry IV. finally annexed it to the crown of France.

RODGERS, JOHN (1771–1838), American sailor, was born in Harford county, Maryland, on the 11th of July, 1771. He entered the United States navy when it was organized in 1798. He was second in command to Commodore James Barron (1760–1851) in the expedition against the Barbary pirates, and succeeded him in the command in 1805. In this year he brought both Tunis and Tripoli to terms, and then returned to America. In 1811 he was in command as commodore of the U.S. frigate "President" (44) off Annapolis when he heard that an American seaman had been "pressed" by a British frigate off Sandy Hook. Commodore Rodgers was ordered to sea "to protect American commerce," but he may have verbal instructions to retaliate for the impressment of real or supposed British subjects out of American vessels, which was causing much ill-feeling and was a main cause of the War of 1812. On the 16th of May 1811 he sighted and followed the British sloop "Little Belt" (22), and after some hailing and counter-hailing, of which very different versions are given on either side, a gun was fired, each side accusing the other of the aggression, and an action ensued in which the "Little Belt" was cut to pieces. This incipient which was represented as an accident by the Americans, and believed to be a deliberate aggression by the British navy, had a share in bringing on war. When hostilities broke out Rodgers commanded a squadron on the coast of America, and was wounded by the bursting of one of his guns while pursuing the British frigate "Belvedere." He was subsequently President of the Board of Navy Commissioners in 1815–1824 and in 1827–1837, and acting secretary of the navy in 1823 for two weeks. He died in Philadelphia on the 1st of August 1838.

His brother, George Washington Rodgers (1787–1832), a brother-in-law of Commodore Perry, served in the War of 1812 and in the war with Algiers (1815). Rear-Admiral John Rodgers (1812–1852), a son of Commodore John Rodgers, served in the Union navy and in 1877–1882 was superintendent of the Naval Observatory at Washington. G. W. Rodgers had two sons who were naval officers, Christopher Raymond Perry Rodgers (1819–1892) and George Washington Rodgers (1822–1863).

RODIN, AUGUSTE (1840– ), French sculptor, was born in 1840, in Paris, and at an early age displayed a taste for his art. He began by attending Barye's classes, but did not yield too completely to his influence. From 1864 to 1870, under pressure of necessity, he was employed in the studio of Carrier-Belleuse, where he learnt to deal with the mechanical difficulties of a kind of sculptural activity which was manifested in his "Man with a Broken Nose." After the war, finding nothing to do in Paris, Rodin went to Brussels, where from 1871 to 1877 he worked, as the colleague of the Belgian artist Van Rasbourgh, on the sculpture for the outside and the carvatures for the interior of the Bourse, besides exhibiting in 1875 a "Portrait of Garnier." In 1877 he contributed to the Salon "The Bronze Age," which was seen again, cast in bronze, at the Salon of 1880, when it took a third-class medal, was purchased by the State, and is now in the museum of the Luxembourg. Between 1882 and 1885 he sent to the Salons busts of "Jean-Paul Laurens" and "Carrier-Belleuse" (1882), "Victor Hugo" and "Daliou" (1884), and "Antoin Proust" (1883). From about this time he chiefly devoted himself to a great decorative composition six metres high, which was not finished for twenty years. This is the "Portal of Hell," the most elaborate perhaps of all Rodin's works, executed to order for the Musée des arts décoratifs. It is inspired mainly by Dante's Inferno; he placed himself being seated at the top, while at his feet, is under-cut relief, we see the writhing crown of the damned, torn by the frenzy of passion and the anguish of despair. The lower part consists of two bas-reliefs, in their midst two masks of tormented faces. Round these run figures of women and centaurs. Above the door three men cling to each other in an attitude of despair. After beginning this titan task, and while continuing to work on it, Rodin executed for the town of Damvillers a statue of "Bastien-Lepage"; for Nancy a "Monument to Claude le Lorrain," representing the Chariot of the Sun drawn by horses; and for Calais "The Burgesses of Calais" surrendering the keys of the town and imploring mercy. In this, Rodin, throwing over all school tradition, represents the citizens not as grouped on a square or circular plinth, but walking in file. This work was exhibited at the Petit Gallery in 1889. At the time of the succession of the National Society of Fine Arts, or New Salon, in 1890, Rodin withdrew from the old Society of French Artists, and exhibited in the New Salon the bust of his friend "Pavis the Bohemian" (1887) and the "Caryatid," both in marble, and the "Movement to Victor Hugo" (1887), intended for the gardens of the Luxembourg. In this the poet is represented nude, as a powerful old man extending his right arm with a sovereign geste, the Muses standing behind him. In 1898 Rodin exhibited two very dissimilar works, "The Kiss," exhibited again in 1900, a marble group representing Paolo Malatesta and Francesca da Rimini, and the sketch in plaster for a "Statue of Balzac." This statue, a commission from the Society of Men of Letters, had long been expected, and was received with vehement dissensions. Some critics regarded this work, in which Balzac was represented in his voluminous dressing-gown as the first-fruits of a new phase of sculpture, others, on the contrary, declared that it was incomprehensible, if not ridiculous. This was the view taken by the society who had ordered it, and who refused to recognize Rodin's rough sketch as a statue of Balzac, and withdrew the commission, giving it to the sculptor Falguere. Falguere exhibited his model in 1899. In the same Salon, Rodin, to prove the strength of his contrapuntal society, made no change in his friendship with Falguere, exhibited a bust in bronze of his rival, as well as one of "Henri Rochefort." In 1900, the city of Paris, to do honour to Rodin, erected at its own expense a building close to one of the entrances to the Great Exhibition, in which almost all of the works of the artist were to be seen, more especially the great "Portal of Hell," still quite incomplete, the "Balzac," and a host of other works, many of them unfinished or mere rough sketches. Here, too, were to be seen some of Rodin's designs, studies and water-colour drawings. He also has executed a great many etchings and sgraffiti on porcelain for the manufactures of Sèvres. His best-known etching is the portrait of Victor Hugo. Many of Rodin's works are in private collections, and at the Luxembourg he is represented by a "Danai" (in marble), a "Saint John" (in bronze, 1880), "She who made the Helmet" (bronze statuette), the busts of "J. P. Laurens" and of "A Lady" and other works. In the Musée Galliera is a very fine bust of Victor Hugo. Rodin's "Harvest of God" was exhibited in the New Gallery, London, in 1903. In 1904 Mr Ernest Beckett (Lord Grimthorpe) presented the British nation with the sculptor's "Le Penseur." In the same year Rodin became president of the International Society of Sculptors, Painters and Engravers, in succession to James McNeill Whistler.

RODNEY, GEORGE BRIDGES RODNEY, BARON (1718–1792), English admiral, second son of Henry Rodney of
Walton-on-Thames, was born in February 1718. His father had served in Spain under the earl of Peterborough, and on quitting the army served as captain in a marine corps which was disbanded in 1713. George was sent to Harrow, being appointed, on leaving, by warrant dated the 21st of June 1732, a volunteer on board the “Sunderland.” While serving on the Mediterranean station he was made lieutenant in the “Dolphin,” his promotion dating the 15th of February 1730. In 1742 he attained the rank of post-captain, having been appointed to the “Plymouth” on the 9th of November. After serving in home waters, he obtained command of the “Eagle” (60), and in this ship took part in Hawke’s victory off Ushant (14th October 1747) over the French fleet. On that day Rodney gained his first laurels for gallantry, under a chief to whom he was in a measure indebted for subsequent success. On the 9th of May 1749 he was appointed governor and commander-in-chief of Newfoundland, with the rank of commodore, it being usual at that time to appoint a naval officer, chiefly on account of the fishery interests. He was elected M.P. for Saltash in 1751, and married his first wife, Jane Compton (1730-1757), sister of the 7th earl of Northampton, in 1753. During the Seven Years’ War Rodney rendered important service. In 1757 he took part in the expedition against Rochefort, commanding the “Dublin” (74). Next year, in the same ship, he served under Boscawen at the taking of Louisburg (Cape Breton). On the 19th of May 1759 he became a rear-admiral, and was shortly after given command of a small squadron intended to destroy a large number of flat-bottomed boats and stores which were being collected at Havre for an invasion of the English coasts. He bombarded the town for two days and nights, and inflicted great loss of war-material on the enemy. In July 1760, with another small squadron, he succeeded in taking many more of the enemy’s flat-bottomed boats and in blockading the coast as far as Dieppe. Elected M.P. for Penryn in 1761, he was in October of that year appointed commander-in-chief of the Leeward Islands station, and within the first three months of 1762 had reduced the important island of Martinique, while both St Lucia and Grenada had surrendered to his squadron. During the siege of Port Royal (now Port de France) his seamen and marines rendered general service. When the peace of 1763 was signed Rodney returned home, having been during his absence made vice-admiral of the Blue and having received the thanks of both houses of parliament.

In 1764 Rodney was created a baronet, and the same year he married Henrietta, daughter of John Clies of Lisbon. From 1765 to 1770 he was governor of Greenwich Hospital, and on the dissolution of parliament in 1768 he successfully contested Northampton at a ruinous cost. When appointed commander-in-chief of the Jamaica station in 1771 he lost his Greenwich post, but a few months later received the office of rear-admiral of Great Britain. Till 1774 he held the Jamaica command, and during a period of quiet was active in improving the naval yards on his station. Sir George struck his flag with a feeling of disappointment at not obtaining the governorship of Jamaica, and was shortly after forced to settle in Paris. Election expenses and losses at play in fashionable circles had shattered his fortune, and he could not secure payment of the salary as rear-admiral of Great Britain. In February 1778, having just been promoted admiral of the White, he used every possible exertion to obtain a command, to free himself from his money difficulties. By May he had, through the splendid generosity of his Parisian friend Marshal Biron, effected the latter task, and accordingly he returned to London with his children. The debt was repaid out of the arrears due to him on his return. The story that he was offered a French command is fiction.

Sir George was appointed once more commander-in-chief of the Leeward Islands late in 1779. His orders were to relieve Gibraltar on his way to the West Indies. He captured a Spanish convoy off Cape Finisterre on the 8th of January 1780, and eight days later defeated the Spanish admiral Don Juan de Langara off Cape St Vincent, taking or destroying seven ships. On the 17th of April an action, which, owing to the carelessness of some of Rodney’s captains, was indecisive, was fought off Martinique with the French admiral Guichen. Rodney, acting under orders, captured the valuable Dutch island of St Eustatius on the 3rd of February 1781. It had been a great entrepôt of neutral trade, and was full of booty, which Rodney confiscated. As large quantities belonged to English merchants, he was entangled in a series of costly lawsuits.

After a few months in England, recruiting his health and defending himself in Parliament, Sir George returned to his command in February 1782, and a running engagement with the French fleet on the 9th of April led up to his crowning victory off Dominica, when on the 12th of April with thirty-five sail of the line he defeated the comte de Grasse, who had thirty-three sail. The French inferiority in numbers was more than counterbalanced by the greater size and superior sailing qualities of their ships, yet five were taken and one sunk, after eleven hours’ fighting. This important battle saved Jamaica and ruined French naval prestige, while it enabled Rodney to write: “Within two little years I have taken two French fleets and five French squadrons, and the worst controversy exists as to the originator of the manœuvre of ‘breaking the line’ in this battle, but the merits of the victory have never seriously been affected by any difference of opinion on the question. A shift of wind broke the French line of battle, and advantage was taken of this by the English ships in two places.

Rodney arrived home in August to receive unbounded honour from his country. He had already been created Baron Rodney of Rodney Stoke, Somerset, by patent of the 19th of June 1782, and the House of Commons had voted him a pension of £2000 a year. From this time he led a quiet country life till his death, which occurred on the 24th of May 1792, in London. He was succeeded as 2nd baron by his son, George (1753-1802), from whom the present baron is descended.

Rodney was unquestionably a most able officer, but he was also vain, selfish and unscrupulous, both in seeking prize money, and in using his position to push the fortunes of his family. He made his son a post-captain at fifteen. He was accused by his second-in-command, Hood, of sacrificing the interest of the service to his own profit, and of showing want of energy in pursuit of the French on the 12th of April 1782. It must be remembered that he was then prematurely old and racketed by disease.

See General Mundy, Life and Correspondence of Admiral Lord Rodney (2 vols., 1830); David Hannay, Life of Rodney; Rodney letters in 9th Report of Hist. MSS. Com., pt. iii.; “Memoirs,” in Naval Chronicle, vol. 333-93; and Charnock, Biographies Navalis, v. 204-26. Lord Rodney published in his lifetime (probably 1789) Letters to His Majesty’s Ministers, &c., relative to St Eustatius, &c., of which there is a copy in the British Museum. Most of these letters are printed in Mundy’s Life, vol. ii., though with many variant readings.

**RODOMONTEADE, or RHOMONADE**, a term for boastful, extravagant language or any inflated bragging speech. The word refers to the brave but boastful Saracen leader Rodomonte in Ariosto’s Orlando Furioso. The name (in the form Rodomante) appears earlier in Boiardo’s Orlando Innamorato. It is supposed to represent a compound of rodare, to roll, and mundare, to wound.

**RODOSTO** (Turkish, Tekir Dagh), a town of European Turkey, in the vilayet of Adrianople, on the coast of the Sea of Marmora, 78 m. W. of Constantinople. Pop. (1905) about 35,000, of whom half are Greeks. The picturesque Bay of Rodosto is enclosed by the great promontory of Combos, a spur about 2000 ft. in height from the hilly plateau to the north. The church of Panagia Rheimatomatissa contains the graves, with long Latin inscriptions, of the Hungarians who were banished from their country in 1686 by the imperialist captors of Buda. Rodosto was long a great depot for the produce of the Adrianople district, but its trade suffered when Dédégarche became the terminus of the railway up the Maritza, and the town is now
RODRIGUEZ—ROE, E. P.

.dependent on its maritime trade, especially its exports to Constantinople. It is the administrative centre of a district (some 30 square miles) and exports copra, rice, oil-cake, seed, and largely planted with mulberry trees, on which silkworms are fed. White cocoons are exported to western Europe (394 cwt. in 1901), silkworms' eggs to Russia and Persia.

Rodosto is the ancient Rhaediaestus or Bisanihe, said to have been founded by Samians. In Xenophon's Anabasis it is mentioned as the kingdom of the Thracian prince Seuthes. Its restoration by the British in the 19th century is not yet confirmed. In 813 and again in 1206 it was sacked by the Bulgarians, but it continues to appear as a place of considerable note in later Byzantine history.

RODRIGUEZ (officially Rodrigues), an island in the Indian Ocean in 19° 41' S., 63° 25' E.; the most important dependency of the British colony of Mauritius, from which it is distant 344 nautical miles. It is a station on the "all-British" cable route between South Africa and Australia, telegraphic communication with Mauritius being established in 1902. With a length of 13 m. E. and W., and a breadth of 3 to 5 m. N. and S., it is an area estimated at 42 sq. m. On all sides it is surrounded by a fringing reef of coral, studded with islets. This reef, only 100 yds. wide at the eastern end of the island, extends westward 3 m., and both N. and S. forms a flat area partly dry at low water. Two passages through the reef are available for large vessels; these leading respectively to Port Mathurin on the N. coast and to Port South-East.

The island was at one period believed to consist of granite overlaid with limestone and other modern formations, and its supposed formation caused it to be regarded as a remnant of the hypothetical continent of Lemuria. Not incompatible with that theory was sent by the British government in 1874 showed, however, that the island is a mass of volcanic rock, mainly a dolerite lava, rich in olivine. The land consists largely of a series of hills. The main ridge, which runs parallel to the longest diameter, rises abruptly on the east, more gradually on the west, where there is a wide plain of coralline limestone, studded with caves, some stalactitic. Of several peaks on the main ridge the highest is Mt. Limon, 1300 ft. above sea-level. The ridge is deeply cut by ravines, the upper parts of which show successive belts of lava separated by thin beds of cinders, agglomerate and coloured clays. In places the cliffs rise 300 ft. and exhibit twelve distinct lava flows. The climate is like that of Mauritius, but Rodriguez is more subject to hurricanes, especially in the north-west monsoon (November to April).

Flora and Fauna.—When discovered, and down into the 17th century, Rodriguez was clothed with fine timber trees; but goats, cattle and bush-fires have combined to destroy the great bulk of the ornamental trees. The island has, however, for some time been ousted by intrusive foreigner. Parts are, however, still well wooded, and elsewhere there is excellent pasture and. The sweet potato, maize, melon, the sugar-cane, cotton, tobacco, are great crops. The orange and passion-fruit are cultivated. Wheat is seldom seen, mainly because of the parakeets and the Java sparrows. Beans (Phaseolus lunatus), lentils, gram (Cicer arietinum), dholl (Cajanus indicus) and ground-nuts are all grown to a certain extent in spite of ravages by rats. The Migrant pigeon is a species (Pandanus heterocarpus, Balf. fil., and P. tenuifolius) occur freely throughout the island. The total number of known species, according to Professor I. B. Balfour, is 470, belonging to 85 families and 293 genera. The family represented is the greatest, and in all cases species (Ionia, Leguminosae, Convolvulaceae, Malvaceae, Rubiaceae, Cynaraeaceae, Euphorbiaceae, Liliaceae, Compositae). Mathurina penduliflora (Turneracea) is interesting, its nearest congener is in Central America. Of 35 species of mosses 17 are peculiar to the island, and many of its epiphytes are characteristic of the flora to quite an unusual degree.

At present the only indigenous mammal is a species of fruit-eating bat (Pteropus rodericianus), and the introduced species are family (Dasyuridae), the wallaby, and the rabbit. In 1882, to a recent period the island was the home of a very large land-tortoise (Testudo vomerai or rodericianis), and its limestone caves have yielded a large number of skeletons of the dodo-like solitaire (Pelecanus cretaeus), which still occurs on the neighboring island in the close of the 17th century, but is now extinct (see Dodo). Deer, once plentiful, had become very scarce by the beginning of the 20th century, having been indiscriminately hunted by the inhabitants. Of indigenous species of birds there have been few. The game-towel (introduced) has become exceedingly abundant, partly owing to a protective game-law; and a francolin (F. ponticerianus), popularly a "partridge," is also common. The marine fish-fauna does not differ from that of Mauritius, and the freshwater species, with the exception of Mugil rodericianis and Myxus caecus, are common to all the Mascarenes. Thirty-five species of crustaceans are known. The insects (probably registered in this volume, e.g. Euphthia, 15 Hymenoptera, 21 Lepidoptra, 15 Orthoptera, and 20 Hemiptera. Forty-nine species of coral have been collected, showing a close affinity to those of Mauritius, Madagascar and the Seychelles.

History.—Rodriguez or Diego Ruy's Island was discovered by the Portuguese in 1645. In 1690 Duquesne prevailed on the Dutch Government to send a body of French Hugenots to the Island of Bourbon, at that time, he believed, abandoned by the French authorities. As the refugees, however, found the French in possession, they proceeded to Rodriguez, and there eight of their number were landed on the 30th of April 1691 with a promise that they should be visited by their compatriots within two years. The two years were spent without misadventure, but, instead of waiting for the arrival of their friends, the seven colonists (for one had meanwhile died) left the island on the 8th of May 1693 and made their way to Mauritius, where they were treated with great cruelty by the governor. The account of the enterprise by Francis Leguat—Voyages et aventures (London, 1708), or, as it is called in the English translation, A New Voyage to the East Indies (London, 1708)—is a garrulous and amusing narrative, and was for a long time almost the only source of information about Rodriguez. His description of the solitaire is unique.

From the Dutch the island passed to the French, who colonized it from Mauritius. Large estates were cultivated, and the Islanders enjoyed considerable prosperity. In 1809-10 Rodriguez was seized by the British, in whose possession it has since remained. The abolition of slavery proved disastrous to the prosperity of the island, and in 1843 the population had sunk to about 250. Since that time there has been a gradual recovery in the economic condition and a steady increase in population. In 1851 the inhabitants numbered 1436; in 1904 the total had risen to 3681. In 1907 the total population was 4231. The inhabitants are mainly of African origin, being descendants of slaves introduced by the French and negro immigrants direct from Africa. There are a few families of European descent (besides the comparatively large staff maintained by the Eastern Telegraph Company) and a small colony of Indians and Chinese. The bulk of the people are French-speaking and Roman Catholics. There are two small settlements, Port Mathurin, the capital, and Gabriel, in the centre of the island. The chief industries are fisheries and cattle-rearing. Salt fish is the principal export, next in importance coming goats, pigs and horned cattle and tobacco. The value of the exports for the four years 1903-06 was £50,894; of the imports for the same period, £54,710. The island is administered by a magistrate appointed by the governor of Mauritius, and the laws are regulations issued by the governor in executive council. The revenue, some £1000 a year, is about half the expenditure incurred, the balance being furnished from the Mauritian treasury. The government maintains a hospital and schools, and pays the taxes of a Roman Catholic.

Leguat's Voyage, edited by Capt. P. Oliver, forms vols. 82 and 83 of the Hakluyt Soc. publications (1891). See also C. Grant, Hist. of Mauritius and the Neighbouring Islands (1801); Higgin, in Journ. R. G. Soc. (1849); the Reports of the Transit of Venus Expedition, published as a series of Philosophical Transactions (clxxxviii., London, 1879) (Botany, by I. B. Balfour; Petrology, by N. S. Maskelyne, &c.); Behm, in Petermann's Mittheilungen (1880); and the annual reports on Mauritius.

ROE, EDWARD PAYSON (1838-1888), American novelist, was born in Moodna, Orange county, N.Y., on the 7th of March 1838. He studied at Williams College and at Auburn Theological Seminary; in 1862 became chaplain of the Second New York Cavalry, U.S.V., and in 1864 chaplain of Hampton Hospital, at Hampton, Virginia. In 1866-74 he was pastor of the Presbyterian Church at Highland Falls, N.Y. In 1874 he removed to Cornwall-on-the-Hudson, where he devoted himself to the writing of fiction and to horticulture. He died on the 10th of July 1888. During the Civil War he wrote weekly
letters to the New York Evangelist, and subsequently lectured on the war and wrote for periodicals. Among his novels were *Barriers Burned Away* (1872), which first appeared as a serial in the Evangelist and made him widely known; *What can she do?* (1873), Opening of a Chestnut Burr (1874), *From jest to earnest* (1875), *Near to Nature’s heart* (1876), *A Knight of the Nineteenth Century* (1877), *A Face Illumined* (1878), *A Day of Fate* (1880), *without a Home* (1881), *Nature’s Serial Story* (1884), *A Young Girl’s Wooing* (1884), *An Original Belle* (1885), *He Fell in love with his Wife* (1886), *The Earth Trembled* (1887) and *Miss Low* (left unfinished, 1888). He wrote also *Play and Profit in My Garden* (1873), *Success with small Fruits* (1881) and *The Home Acre* (1887). His novels were very popular in their day, especially with middle-class readers in England and America, and were translated into several European languages. Their strong moral and religious purpose, and their being written by a dergymian, old much to break down a Puritan prejudice in America against works of fiction.

See E. P. Roe: *Reminiscences of his Life* (New York, 1899), by his son.

**ROE, SIR T.** (ROE, Sir Row), SIR THOMAS (c. 1581-1644), English diplomatist, son of Robert Rowe, and of Elinor, daughter of Robert Jermy of Worstead in Norfolk, was born at Low Leyton near Wanstead in Essex, and at the age of twelve (1593) matriculated at Magdalen College, Oxford. Shortly afterwards he joined one of the inns of court, and was made esquire of the body to Queen Elizabeth. He was knighted by James I. in 1605, and became intimate with Henry, prince of Wales, and also with his sister Elizabeth, afterwards queen of Bohemia, with whom he maintained a correspondence and whose cause he championed. In 1610 he was sent by Prince Henry on a mission to the West Indies, during which he visited Guiana and the river Amazon, but failed then, and in two subsequent expeditions, to discover the gold which was the object of his travels. In 1614 he was elected M.P. for Tamworth, and in 1621 for Cirencester. His permanent reputation was mainly secured by the success which attended his embassy in 1613-18 to the court at Agra of the Great Mogul, Jahângir, the principal object of the mission being to obtain protection for an English factor at Surat. Appointed ambassador to the Porte in 1621, which he even then describes as being “irrevocably sick,” he distinguished himself by further successes. He obtained an extension of the privileges of the English merchants, concluded a treaty with Algiers in 1624, by which he secured the liberation of several hundred English captives, and gained the support, by an English subsidy, of the Transylvanian Prince Bethlen Gabor for the European Protestant alliance and the cause of the Palatinate. Through his friendship with the patriarch of the Greek Church, Cyril Lucaris, the famous Codex Alexandrinus was presented to James I., and Roe himself collected several valuable MSS. which he subsequently presented to the Bodleian library. In 1620 he was again successful in another mission undertaken to arrange a peace between Sweden and Poland. Subsequently Roe negotiated treaties with Danzig and Denmark, returning home in 1620, when a gold medal was struck in his honour. In January 1637 he was appointed to the order of the Garter, with a pension of £100 a year. Subsequently he took part in the peace conferences at Hamburg, Regensburg and Vienna, and used his influence to obtain the restorations of the Palatinate, the emperor declaring that he had “scarcely ever met with an ambassador till now.” In June 1640 he was made a privy councillor, and in October was returned to parliament as member for the university of Oxford, where his unrivalled knowledge of foreign affairs, commerce and finance, together with his learning and eloquence, gained him in another sphere considerable reputation. He died on the 6th of November 1644. He had married Eleanor, daughter of Sir Thomas Carr of Stamford, Northamptonshire. Roe was a distinguished and most successful diplomatist, an accomplished scholar and a patron of learning, while his personal character was unblemished.

His Journal of the mission to the Mogul, several times printed, has been re-edited, with an introduction by W. Foster, for the Hakluyt Society (1899). This is a valuable contribution to the history of India in the early 17th century. Of his correspondence, Negotiations in his Embassy to the Ottoman Porte, 1622-38, vol. i., was published in 1740, but the work was not continued. Other correspondence, consisting of letters relating to his mission to Gustavus Adolphus, was edited by S. R. Gardiner for the Camden Society. In 1839, W. W. Wycliffe issued a select correspondence with Lord Carew in 1615 and 1617 by Sir F. Maclean for the same society in 1860. Several of his MSS. are in the British Museum collections. Roe published a *True and Faithful Relation . . . concerning the Deeds of Sultan Ob i* (1622); a translation from Sarpi, *Discourse upon the Resolution taken in the Valletine* (1628); and in 1613 Dr. T. Wright published Quattuor Colloquia, consisting of theological disputations between himself and Roe; a poem by Roe is printed in Notes and Queries, iv. Ser. v. 9. The Swedish *Intelligenz* (1629-31), including an account of the career of Gustavus Adolphus and of the Diet of Ratisbon (Regensburg), is attributed to Roe in the catalogue of the British Museum. Several of his speeches, chiefly on currency and financial questions, were also published. Two works of Roe, MS’s, are mentioned by Wood: *Compendious Relation of the Proceedings . . . of the Imperial Diet at Ratisbon and Journal of Several Proceedings of the Order of the Garter.*

**ROEBLING, JOHN AUGUSTUS** (1806-1869), American civil engineer, was born at Mülhausen, Prussia, on the 6th of June 1806. Soon after his graduation from the polytechnic school at Berlin he removed to the United States and settled in New York, where he was occupied in the practice of his profession in western Pennsylvania. He established at Pittsburg a manufactory of wire-ropes, and in May 1845 completed his first important structure, a suspended aqueduct across the Allegheny river. This was followed by the Monongahela suspension bridge at Pittsburg and several suspended aqueducts on the Delaware & Hudson Canal. Removing his wire manufactory to Trenton, New Jersey, he began, in 1851, the erection at Niagara Falls of a long span wire suspension bridge with double roadway, for railway and carriage use (see Bridge), which was completed in 1855. Owing to the novelty of its design, the most eminent engineers regarded this bridge as foredoomed to failure; but, with its complete success, demonstrated by long use, the number of suspension bridges rapidly multiplied, the use of wire-ropes instead of chain-cables becoming all but universal. The completion, in 1867, of the still more remarkable suspension bridge over the Ohio river at Cincinnati, 1057 ft., added to Roebling’s reputation, and his design for the suspension bridge spanning the East river between New York and Brooklyn was accepted. While personally engaged in laying out the towers for the bridge, Roebling received an accidental injury, which resulted in his death, at Brooklyn, from tetanus, on the 22nd of July 1869. The bridge was completed under the direction of his son, Washington Augustus Roebling (b. 1837), who introduced several modifications in the original plans.

**ROEBOURNE, a settlement of De Witt county, Western Australia, 8 m. from the N.W. coast, on the Harding river, 920 m. direct N. of Perth. It is the centre of one of the richest and most varied mineral districts in the colony; gold, silver, tin, lead, copper, diamonds and other precious stones are found. There are extensive pearl fisheries off its port at Cossack Bay.**

**ROEBUCK, J.** (1718-1794), English inventor, was born in 1718 at Sheffield, where his father had a prosperous manufacturing business. After leaving the grammar school at Sheffield and Dr Philip Doddridge’s academy at Northampton, he studied medicine at Edinburgh, where he was imbued with a taste for chemistry by the lectures of William Cullen and Joseph Black, and he finally graduated M.D. at Leiden in 1742. He started practice at Birmingham, but devoted much of his time to chemistry, especially in its practical applications. Among the most important of his early achievements in this field was the introduction, in 1746, of leaden condensing chambers for use in the manufacture of sulphuric acid. Together with Samuel Garbett he erected a factory at Prestonpans, near Edinburgh, for the production of the acid in 1749, and for some years enjoyed a monopoly; but ultimately his methods became known, and, having omitted to take out patents for
them at the proper time, he was unable to restrain others from making use of them. Engaging next in the manufacture of iron, he in 1760 established the ironworks which still exist at Carron, in Stirlingshire. There he introduced various improvements in the methods of production, including the conversion (patented in 1762) of cast iron into malleable iron “by the action of a hollow pit-coal fire” urged by a powerful artificial blast. His next enterprise was less successful. He leased a colliery at Bo’ness to supply coal to the Carron works, but in sinking for new seams encountered such quantities of water that the Newcomen engine which he used was unable to keep the pit clear. In this difficulty he heard of James Watt’s engine and entered into communication with its inventor. This engine, then at an early stage of its development, also proved inadequate, but Roe buck became a strong believer in its future and in return for a two-thirds share in the invention assisted Watt in perfecting its details. His troubles at the colliery, however, aggravated by the failure of an attempt to manufacture alkali, brought him into pecuniary straits, and he parted with his share in Watt’s engine to Matthew Boulton in return for the cancellation of a debt of £200 which he owed the latter. Subsequently, though he had to give up his interest in the Bo’ness works, he continued to manage them and to reside at the neighbouring Kin nell House, where he occupied himself with farming on a considerable scale. He died on the 17th of July 1794.

ROEBUCK, JOHN ARTHUR (1801–1879), British politician, was born at Madras on the 28th of December 1801. After the death of his father, a civil servant, his mother’s second marriage transferred him to Canada, where he was chiefly brought up. He came to England in 1824, was called to the bar (Q.C. 1843), became intimate with the leading radical and utilitarian reformers, was elected M.P. for Bath in 1832, and took up that general attitude of hostility to the government of the day, be it what it might, which he retained throughout his life. At all times conspicuous for his eloquence, honesty and rectitude, and never shying away from a question when it served public interest—e.g. in 1838, when, although at the time without a seat in parliament, he appeared at the bar of the Commons to protest, in the name of the Canadian Assembly, against the suspension of the Canadian constitution; and in 1855, when, having overthrown Lord Aberdeen’s ministry by carrying a resolution for the appointment of a committee of inquiry into the mismanagement in the Crimean War, he presided over its proceedings. In his latter years his political opinions became greatly modified, but with one interruption he retained his seat for Sheffield, which he had won in 1849, until his death in London on the 30th of November 1879.

ROEBUCK, the smallest of the British deer (a full-grown buck standing not more than 27 in. high at the shoulder), the typical representative of a genus (Capreolus) in which the antlers lack a brow-tine and belong to what is characterized as the forked type, while the tail is rudimentary (see DEER). The antlers are short, upright and deeply furrowed, the beamforking at about two-thirds of its length, and the upper prong again dividing; thus making three points. The coat in summer is foxy red above and white below; in winter this changes to a greyish fawn, with a white rump-patch. The roe-buck or roe-deer (Capreolus capreus), or C. capreolus in-feralis, of the southern and temperate Europe as far east as the Caucasus, where, as in Syria, it is probably represented by another race or species. It frequents woods, preferring such as have a large growth of underwood and are in the neighbourhood of cultivated ground. It latter it visits in the evening in search of food; and where roe are numerous the damage done to growing crops is considerable. Pairing takes place in August, but the fawns are not born till the following May. According to one theory, the germ lies dormant until December, when it begins to develop; but it is now believed that this long gestation is due to slow rather than arrested development. Roe were formerly abundant in all the wooded parts of Great Britain, but were gradually exterminated, till a century and a half ago they were unknown south of Perthshire. Since then the increase of plantations has led to the partial restoration of the species in the south of Scotland and the north of England; and it was reintroduced into Dorset early in the 19th century. These deer take readily to the water, and they have been known to swim across lochs more than half a mile in breadth. The Siberian roe (C. pygargus), which is common in the Altai, is larger and paler than the type species, with shorter and more hairy ears, a larger white rump-patch, and small irregular snags on the inner border of the antlers. The Manchurian roe (Capreolus manchuricus) is about the size of the European species, with antlers of the type of those of the Siberian roe, but more slender, and the coat shorter. Although described in 1889 as a local variety of the Siberian species, the Manchurian roe really appears, both as regards stature, hairiness and the black and white markings on the muzzle, much more nearly related to the European animal. This is the more remarkable seeing that the habitats of the two are separated by such an enormous tract of country.

ROEDERER, PIERRE LOUIS, COMTE (1754–1833), French politician and economist, was born at Metz on the 15th of December 1754, the son of a magistrate. At the age of twenty-five he became counsellor at the parliament of Metz, and was commissioned in 1787 to draw up a list of royal franchises. His work advocating the suppression of internal customs houses (Suppression des douanes intérieures), published the same year, is an elaborate treatise on the laws of commerce and on the theory of customs imposts. In 1788 he published Députation aux États généraux, a pamphlet remarkable for its bold exposition of liberal principles, and partly on the strength of this he was elected deputy to the states-general by the Third Estate of the bailliage of Metz. In the Constituent Assembly he was a member of the committee of taxes (comité des contributions), prepared a scheme for a new system of taxation, drew up a law on patents, occupied himself with the laws relating to stamps and assignats, and was successful in opposing the introduction of an income tax. After the close of the Constituent Assembly he was elected, on the 11th of November 1791, procureur général syndic of the department of Paris. The directory of the department, of which the due du des Douanes was president, was at this time in pronounced opposition to the advanced views that dominated the Legislative Assembly and the Jacobin Club, and Roederer was not altogether in touch with his colleagues. Thus he took no share in signing their protest against the law against the non-juring clergy, as a violation of religious liberty. But the directory did not long survive. With the growing anarchy of the capital many of its members resigned and fled, and their places could not be filled up. Roederer himself has left in his Chronique des cinquante jours (1832) an account of the pitiable part played by the directory of the department in the critical period between the 20th of June and the 10th of August 1792. Seeing the perilous drift of things, he had tried to get into touch with the king; and it was on his advice that Louis, on the fatal 10th, took refuge in the Assembly. His conduct arousing suspicion, he went into hiding, and did not emerge again until after the fall of Robespierre. In 1796 he was made a member of the Institute, which was devoted to the advancement of political economy, and founded the Journal d’économie publique, de morale et de législation. Having escaped deportation at the time of the coup d’état of 18 Brumaire, he took part in the revolution of 18 Brumaire, and was appointed by Napoleon member of the council of state and senator. Under the Empire, Roederer, whose public influence was very considerable, was Joseph Bonaparte’s minister of finance at Naples (1806), administrator of the grand duchy of Berg (1810), and imperial commissary in the south of France. During the Hundred Days he was created a peer of France. The Restoration government stripped him of his offices and dignities, but he recovered the title of peer of France in 1832. He died on the 17th of December 1835. His son, Baron Antoine Marie Roederer
ROEMER, F. A.—ROGATION DAYS

(1782-1865), was also a politician of some note in his day.

Among P. L. Roederer's writings may be mentioned Louis XII. (1830; François J. (1825; Comédies historiques (1827-33); L'Esprit de la révolution de 1789 (1831); La Première et la deuxième année du consulat de Bonaparte (1802); Chronique des cinquante jours, an account of the events of the 19th of August 1792; and Mémoire pour servir à l'histoire de la société policière (1835).

ROEMER, FRIEDRICH ADOLPH (1809-1869), German geologist, was born at Hildesheim, in Prussia, on the 14th of April 1809. His father was a lawyer and counsellor of the high court of justice. In 1845 he became professor of mineralogy and geology at Clausthal, and in 1862 director of the School of Mines. He first described the Cretaceous and Jurassic strata of Germany in elaborate works entitled Die Versteinerungen des Norddeutschen Oolitischen-gebirges (1836-39); Die Versteinerungen des Norddeutschen Kreidegebirges (1840-41) and Die Versteinerungen des Harzgebirges (1843). He died at Clausthal on the 25th of November 1869.

His brother, CARL FERDINAND VON ROEMER (1816-1891), who had been educated for the legal profession at Göttingen, also became interested in geology, and abandoning law in 1840, studied science at the University of Berlin, where he graduated Ph.D. in 1842. Twelve years later he published his first work, Das Rheinische Übergangsgestein (1844), in which he dealt with the older rocks and fossils. In 1845 he paid a visit to America, and devoted a year and a half to a careful study of the geology of Texas and other Southern states. He published at Bonn in 1849 a general work entitled Texas, while the results of his investigations of the Cretaceous rocks and fossils were published three years later in a treatise, Die Kreideblöcke von Texas und ihre organischen Einschlüsse (1852), which included also a general account of the geology, and gained for him the title "Father of the geology of Texas."

Subsequently he published at Breslau Die Silurische Fauna des westlichen Tennessee (1860). During the preparation of these works he was from 1847 to 1855 "privat-docent" at Bonn, and was then appointed professor of geology, palaeontology and mineralogy in the university of Breslau, a post which he held with signal success as a teacher until his death. As a palaeontologist he made important contributions to our knowledge especially of the invertebrata of the Devonian and older rocks. He assisted H. G. Bronn with the third edition of the Lehrbuch der geologie (1857-58), and subsequently he was engaged on the enlarged and revised edition of which he published one section, Lethaca palaeosolica (1876-1883). In 1886 he published a paper, superintend the preparation of a geological map of Upper Silesia, and the results of his researches were embodied in his Geologie von Oberschlesien (3 vols., 1870). As a mineralogist he was likewise well known, more particularly by his practical teachings and by the collection he formed in the Museum at Breslau. He died at Breslau on the 14th of December 1891.

ROEMER, OLE (Latinized Olaus) (1644-1710), Danish astronomer, was born at Aarhus in Jutland on the 29th of September 1644. He became in 1662 the pupil and amanuensis of Erasmus Bartholinus at Copenhagen, and assisted J. Picard in 1671 to determine the geographical position of Tycho Brahe's observatory (Uraniborg on the island of Hveen). In 1672 he accompanied Picard to Paris, where he remained nine years, occupied with observations at the new royal observatory and hydraulic works at Versailles and Marly. On the 22nd of November 1675 he read a paper before the Academy on the successive propagation of light as revealed by a certain inequality in the motion of the first Jupiter's satellites. A scientific mission to England in 1679 made him acquainted with Newton, Halley and Flamsteed. In 1681, on the summons of Christian V., king of Denmark, he returned to Copenhagen as royal mathematician and professor of astronomy in the university; and from 1688 he discharged, besides, many important administrative functions, including those of mayor (1705), chief of police and privy councillor. He died at Copenhagen on the 23rd of September 1710.

Roemer will always be remembered as the discoverer of the finite velocity of light. He showed besides wonderful ingenuity in the improvement of astronomical apparatus. The first transit instrument worthy the name was in 1690 erected in his house. In the same year he set up in the university observatory an instrument with altitude and azimuth circles (for observing equal altitudes on both sides of the meridian) and an equatorial telescope. In 1704 he built, at his own cost, the so-called "Tuscan" observatory at Vridloesmale, a few miles west of Copenhagen, and equipped it with a meridian circle (the transit instrument and vertical circle combined) and a transit moving in the prime vertical. Roemer thus effectively realized nearly all our modern instruments of precision, and accumulated with them a large mass of observations, on which the most undeservedly perished in the great conflagration of the 21st of October 1728, except the three nights' work discussed by J. G. Galle (O. Roemer iridium observationum astronomicae a uraniborgia datis institutam, Berlin, 1843).

ROERMUND, a town in the province of Limburg, Holland, on the right bank of the Maas at the confluence of the Roer, and a junction station 28 m. by rail N.N.E. of Maastricht. Pop. (1900) 12,348. The old fortifications have been dismantled and partly converted into fine promenades. At this point the Maas is crossed by a bridge erected in 1866-67, and the Roer by one dating from 1771, replacing an older structure, and connecting Roermond with the suburb of St Jacob. Roermond is the seat of a Roman Catholic episcopal see. The finest building in the town is the Romanesque minster church of the first quarter of the 13th century. In the middle of the nave is the tomb of Gerhard III., count of Gelderland, and his wife Margaret of Brabant. It was formerly the church of a Cistercian nunnery, and in modern times has been elaborately restored. The cathedral of St Christopher is also of note; on the top of the tower (246 ft.) is a copper statue of the Virgin, and the interior is adorned with paintings by Rubens, Jacob de Witt, and others. The Reform Church has its seat in the chapel of the monastery of the Minorites. There is also a Redemptorist chapel.

Close to Roermond on the west is the village of Horn, once the seat of a lordship of the same name, which is first mentioned in a document of 1166. The lordship of Horn was a fief of the counts of Looen, and after 1361 of the bishop of Liége; but in 1450 it was raised to a countship by the Emperor Frederick II. On the extinction of the house of Horn in 1540, the countship passed to the famous Philip of Montmorency, who, with the count of Egmont, was executed in Brussels in 1588 by order of the duke of Alva. In the beginning of the next century the countship was forcibly retained by the see of Liége, and was incorporated in the French department of the Lower Maas at the end of the 18th century. The ancient castle is in an excellent state of preservation and is sometimes used for the assembly of the states.

ROGATION DAYS (lat. rogatio, from rogare, to beseech; the equivalent of Gr. ῥαγατία, litany), in the Calendar of the Christian Church, the Monday, Tuesday and Wednesday after Ascension Day, so called because long associated with the chanting of litanies in procession (рогатоны). The week in which they occur is sometimes called Rogation Week. In 511
the first Council of Orleans ordered that the three days preceding Ascension Day should be celebrated as rogation days with fasting and rogations. All work was to be suspended that all might join in the processions. Leo III. (pope 795–816) introduced rogation days, but without the fasting, at Rome. St Augustine had earlier introduced the custom into the English Church, learning it on his way through Gaul. The Council of Clovesho in 747 confirmed Augustine’s injunction, and ordered that the rogation days be kept up “according to the way of our fathers.” The place-name “Gospel Oak,” which occurs in London and elsewhere, is a relic of this rogation processions, the gospel of the day being read at the foot of the finest oak the parish boasted. After the Reformation the processions gradually ceased to be ecclesiastical in England, and are now practically secularized into the perambulation of the parish boundaries on or about Ascension Day.

**ROGER I.**

**ROGER I. (1051–1101), ruler of Sicily, was the youngest son of Tancred of Hauteville. He arrived in Southern Italy soon after 1057, Malaterra, who compares Robert Guiscard (see GUISCARD, ROBERT) and his brother to “Joseph and Benjamin of old,” says of Roger: “He was a youth of the greatest beauty, of lofty stature, of graceful shape, most eloquent in speech and cool in counsel. He was far-seeing in arranging all his actions, pleasant and merry all with men; strong and brave, and furious in battle.” He shared with Robert Guiscard the conquest of Calabria, and in a treaty of 1062 the brothers in dividing the conquest apparently made a kind of “condominium” by which either was to have half of every castle and town in Calabria.1 Robert now resolved to employ Roger’s genius in reducing Sicily, which contained, besides the Moslems, numerous Greek Christians subject to Arab princes who had become all but independent of the sultan of Tunis. In May 1061 the brothers crossed from Reggio and captured Messina. After Palermo had been taken in January 1072 Robert Guiscard, as suzerain, invested Roger as count of Sicily, but retained Palermo, half of Messina and the north-east portion (the Val Demone). Not till 1085, however, was Roger able to undertake a systematic crusade. In March 1086 Syracuse surrendered, and when in February 1091 Noto yielded the conquest was complete. Much of Robert’s success had been due to Roger’s support. Similarly the latter supported Duke Roger, his nephew, against Bohemund, Capua and his rebels, and the real leadership of the Hautevilles passed to the Sicilian court. In return for his aid against Bohemund and his rebels the duke surrendered to his uncle in 1085 his share in the castles of Calabria, and in 1091 the half of Palermo. Roger’s rule in Sicily was more real than Robert Guiscard’s in Italy. At the enfeofments of 1072 and 1092 no great undivided feuds were created, and the mixed Norman, French and Italian elements owed their benefits to the count. No feudal revolt of importance therefore troubled Roger. Politically supreme, the count became master of the island. Church. While he gave full toleration to the Greek Churches, he persecuted many Latin bishoprics at Syracuse and Girgenti and elsewhere, nominating the bishops personally, while he turned the archbishopric of Palermo into a Catholic see. The Papacy, favouring a prince who had recovered Sicily from Greeks and Moslems, granted to him and his heirs in 1088 the Apostolic Legateship in the island. Roger practised general toleration to Arabs and Greeks, allowing to each race the expansion of its own civilization. In the cities the Moslems, who had generally secured such terms of surrender, retained their mosques, their kadis, and freedom of trade; in the country, however, they became serfs. He drew from the Moslems the mass of his infantry, and St Anselm visiting him at the siege of Capua, 1098, found “the brown tents of the Arabs innumerable.” Nevertheless the Latin element began to prevail with the Lombards and other Italians who flocked into the island in the wake of the conquest, and the conquest of Sicily was decisive in the steady decline from this time of Mahommedan power in the western Mediterranean.

---

1 See Chalandon, *La Domination normande*, vol. i. p. 200.

**ROGER II.**

**ROGER II. (1095–1154), king of Sicily, son of the preceding, began personally to rule in 1112, and from the first aimed at uniting the whole of the Norman conquests in Italy. In June 1127, William, duke of Apulia, grandson of Robert Guiscard, died childless, having apparently made some vague promise of the succession to Roger. In any case Roger claimed at once, not only all the Hauteville possessions, but also the overlordship of Capua, for which Richard II. in 1098 had sworn homage to Duke Roger. The union of Sicily and Apulia, however, was resisted by Honorius II. and by the subjects of the duchy itself, averse from any strong ducal power, and the pope at Capua (July 1127) preached a crusade against the claimant, setting against him Robert II. of Capua and Ranulf of Alife, or Avellino, brother-in-law of Roger, who proved himself the real leader of the revolt. The coalition, however, failed, and in August 1128 Honorius invested Roger at Benevento as duke of Apulia. The baronial resistance, which was backed by Naples, Bari, Salerno and other cities, whose aim was civic freedom, also gave way, and at Melfi (Sept. 1129) Roger was generally recognized as duke by Naples, Capua and the rest. He began at once to enforce order in the Hauteville possessions, where the ducal power had long been falling to pieces. For the binding together of all his states the royal name seemed essential, and the death of Honorius in February 1130, followed by a double election, seemed the decisive moment. While Innocent II. fled to France, Roger, with deep design, supported Anacletus II. The price was a crown, and on the 27th of September 1130 a bull of Anacletus made Roger king of Sicily. He was crowned in Palermo on the 25th of December 1130.

This plunged Roger into a ten years’ war. Bernard of Clairvaux, Innocent’s champion, built up against Anacletus and his “half heathen king” a coalition joined by Louis VI. of France, Henry I. of England and the emperor Lothar. Meanwhile the forces of revolt in South Italy drew to a head again. The rebels under Ranulf shamefully defeated the king at Nocera on the 24th of July 1132. Nevertheless, by July 1134 his terrific energy and the savagery of his Saracen troops forced Ranulf, Sergius, duke of Naples, and the rebels to submit, while Robert was expelled from Capua. Meanwhile Lothar’s contemplated attack upon Roger had gained the backing of Pisa, Genoa and the Greek emperor, all of whom feared the growth of a powerful Norman kingdom. In February 1137 Lothar began to move south and was joined by Ranulf and the rebels; in June he besieged and took Bari. At San Severino, after a victorious campaign, he and the pope jointly invested Robert of Capua and the old duke of Apulia (July 1137), and the emperor then retired to Germany. Roger, freed from the utmost danger, recovered ground, sacked Capua and forced Sergius to acknowledge him as overlord of Naples. At Rignano the indomitable Ranulf again utterly defeated the king, but in April 1139 Ranulf died, leaving none to oppose Roger, who subdued pitilessly the last of the rebels.

The death of Anacletus (25 Jan. 1138) determined Roger to seek the confirmation of his title from Innocent. The latter, invading the kingdom with a large army, was skilfully ambushed at Galuccio on the Garigliano (22 July 1139). This secured the king’s object; on the 29th July the pope invested him as “Rex Siciliae ducatus Apuliae et principatus Capuae.” The boundaries of the “regno” were finally fixed, by a truce with the pope in October 1144, at a line south of the Tronto and east of Terracina and Ceprano.

Roger, now become one of the greatest kings in Europe, made Sicily the leading maritime power in the Mediterranean. A powerful fleet was built up under several “admirals,” or
ROGER—ROGER OF HOVEDEN

"emirs," of whom the greatest was George of Antioch, formerly in the service of the Moslem prince of El Mehid. Mainly by him a series of conquests were made on the African coast (1135-53) which reached from Tripoli to Cape Bon. The second crusade (1147-48) gave Roger an opportunity to revive Robert Guiscard's designs on the Greek Empire. George England was sent to Corinthis at the end of 1147 and despatched an army inland which plundered Thbes. In June 1149 the admiral appeared before Constantinople and defied the Basilieus by firing arrows against the palace windows. The attack on the empire had, however, no abiding results. The king died at Palermo on the 26th of February 1154, and was succeeded by his fourth son William.

Personally Roger was of tall and powerful body, with long fair hair and full beard. "He had," says Romnald of Salerno, "a lion face, and spoke with a harsh voice." With little or none of Robert Guiscard's personal valour, and living at intervals the life of an eastern Sultan, he yet showed to the full his uncle's audacity, diplomatic skill and determination. It is Roger II.'s distinction to have united all the Norman conquests into one kingdom and to have subjected them to a government scientific, personal and centralized. In this he was followed by the kings of Sicily, by his nephew Roger, who succeeded in the Assizes of the kingdom of Sicily, promulgated at Aragon in 1140, which enforced an almost absolute royal power. At Palermo Roger drew round him distinguished men of various races, such as the famous Arab geographer Idrisi and the historian Nilus Doxopatius. The king's active and curious mind welcomed the learned; he maintained a complete toleration for the several creeds, races and languages of his realm; he was served by men of nationality so dissimilar as the Englishman Thomas Brun, a kaid of the Curia, and, in the fleet, by the renegade Moslem Christodoulos, and the Antiochean George, whom he made in 1132 "amiratus amiratorum," in effect prime vizier. The Capella Palatina, at Palermo, the most wonderful of Roger's churches, with Norman doors, Saracenic arches, Byzantine dome, and roof adorned with Arabic scripts, is perhaps the most striking product of the brilliant and mixed civilization over which the grandee of the Norman Trancre ruled.

Contemporary authors are: Falco of Benevento, Alexander of Tiberia, Romnald of Sicily and Hugo Falsacius, with the 'Annals of Roger II.' ed. Del Re; the 'Cronica A,' E. Caspar, 'Roger II. und die Gründung der normannisch-sicilischen Monarchie' (Innsbruck, 1904).

ROGER (d. 1139), bishop of Salisbury, was originally priest of a small chapel near Caen. The future King Henry I., who happened to hear mass there one day, was impressed by the speed with which Roger read the service, and enrolled him in his own service. Roger, though uneducated, showed great talent for business, and Henry, on coming to the throne, almost immediately made him chancellor (1100). Soon after Roger received the bishopric of Salisbury. In the Investitures controversy he skillfully managed to keep the favour of both the king and Anselm. Roger devoted himself to administrative business, and remodelled it completely. He created the exchequer system, which was managed by him and his family for more than a century, and he used his position to heap up power and riches. He became the first man in England after the king, and was in office, if not in title, justiciar. He ruled England while Henry was in Normandy, and succeeded in obtaining the see of Canterbury for his nominee, William of Corbeil. Duke Robert seems to have been put into his custody after Tinesha. Though Roger had sworn allegiance to Matilda, he disliked the Angevin connexion, and went over to Stephen, carrying with him the royal treasure and administrative system (1135). Stephen placed great reliance on him, on his nephews, the bishops of Ely and Lincoln, and on his son Roger, who was treasurer. The king declared that if Roger demanded half of the kingdom he should have it, but chafed against the overwhelming influence of the official clique whom Roger represented. Roger himself had built at Devizes the most splendid castle in Christendom. He and his nephews seem to have secured a castles outside their own dioceses, and the old bishop behaved as if he were an equal of the king. At a council held in June 1136, Stephen found a pretext for demanding a surrender of their castles, and on their refusal they were arrested. After a short struggle all Roger's great castles were sequestrated. But Henry of Winchester demanded the restoration of the bishop. The king was considered to have committed an almost unpardonable crime in offering violence to members of the church, in defiance of the scriptural command, "Touch not mine anointed." Stephen took up a defiant attitude, and the question remained unsettled. This quarrel with the church, which immediately preceded the landing of the empress, had a serious effect on Stephen's fortunes. The moment that the fortune of war declared against him, the clergy acknowledged Matilda. Bishop Roger, however, did not live to see himself avenged. He died at Salisbury in December 1139. He was a great bureaucrat, and a builder whose taste was in advance of his age. But his contemporaries were probably justified in regarding him as the type of the bishop immersed in worldly affairs, ambitious, avaricious, unfettered by any high standard of personal principle.

Roger's nephew Alexander (d. 1148), who became bishop of Lincoln in 1123, was a typical secular ecclesiastic of the middle ages, wealthy, proud, ambitious and ostentatious. He founded monasteries, built castles at Newark, Sleaford and Banbury, and restored his cathedral at Lincoln after the fire of 1145. He followed the policy of Roger, whose imprisonment he shared, and died after a visit to Pope Eugenius III. at Aixerre, early in 1148.

ROGER (d. 1181), archbishop of York, known as Roger of Pont l'Evêque, was a member of the household of Theobald, archbishop of Canterbury, where he quarrelled violently with another future archbishop, Thomas Becket. In 1148 he was appointed archdeacon of Canterbury, and soon afterwards chaplain to King Stephen, who sent him on an errand to Rome in 1152; then in October 1154 he was consecrated archbishop of York in Westminster Abbey. When Henry II. entered upon his great struggle with Becket the archbishop, as a clerk in secular jurisdiction, he managed to secure the support of Roger, and having been appointed papal legate in England, the archbishop visited Pope Alexander III. and the French king, Louis VII., in his master's interests. In June 1170 he crowned the king's son Henry, in spite of prohibitions from the pope and from Becket, and for this act he was suspended. One authority declares that Roger, who was then with Henry II. in Normandy, instigated the murder of the rival archbishop, but he swore he was innocent of this crime. He quarrelled with Richard, the new archbishop of Canterbury, about the respective rights of the two archiepiscopal sees, until 1176, when the king arranged a truce between them; and he was constantly endeavouring to assert his supremacy over the Scottish church. The archbishop died at York on the 21st of November 1181. He was always loyal to Henry II., to whom he was very useful during the great rising of 1174; but he has been accused of avarice, and he was certainly not lacking in ambition.

Another English prelate of this name was Roger, bishop of Worcester, a younger son of Robert, earl of Gloucester, and thus a grandson of the English king Henry I. In 1163 his cousin Henry II. appointed him bishop of Worcester, but almost alone of the English bishops he supported Thomas Becket and not the king during the dispute with the archbishop. In 1167 he left England to share Becket's exile, but he soon returned to court, although he appears to have remained on friendly terms with the archbishop. He died at Tours in 1179.

ROGER OF HOVEDEN, or HOwDEN (fl. 1174-1201), English chronicler, was, to judge from his name and the internal evidence of his work, a native of Howden in the East Riding of Yorkshire. But nothing is known of him before the year 1174. He was then in attendance upon Henry II., by whom
ROGER OF WENDOVER—ROGERS, J. E. T.

ROGERS, HENRY (1806-1877), English Nonconformist divine, was born at St Albans on the 8th of October 1806, and was educated privately and by his father, a surgeon of considerable culture. Rogers was meant to follow his father's profession, but the reading of John Howe turned him to theology, and after qualifying at Highbury College he accepted a call to the Congregational Church at Pooe in 1829. In 1832 he was appointed lecturer in logic at Highbury, in 1836 professor of English at University College, London, and in 1839 professor of English, mathematics and mental philosophy at Spring Hill College, Birmingham. In 1836 appeared his Life and Character of John Howe, and in 1837 The Christian Correspondent, a collection of some 400 religious letters "by eminent persons of both sexes." His contributions to the Edinburgh Review began in 1839 and were collected in volume form in 1839, 1855 and 1874. His most famous book, The Eclipse of Faith, or a Visit to a Religious Sect, was published anonymously in 1852 and went through six editions in the same years. It drew a Reply from F. W. Newman, which Rogers answered in a Defence (1854). Two volumes of imaginary letters, Selections from the Correspondence of R. E. H. Greyson (an anagram for his own name), appeared in 1857 and show his style at its best. In 1858 he became principal and professor of theology at the Lancashire Independent College, where he edited the works of John Howe (6 vols., 1862-63) and wrote for the British Quarterly. He retired in 1871, and died at Machynlleth on the 21st of August 1877. Rogers was widely read, and as a Christian apologist carried on the traditions of the 18th century as illustrated by Butler.

See Memoir by Dr R. W. Dale, prefixed to the 8th edition of The Supernatural Origin of the Bible Inferred from Itself (the Congregational Lecture for 1873, delivered by Rogers).

ROGERS, HENRY DARWIN (1808-1866), American geologist, was born at Philadelphia on the 1st of August 1808. At the age of twenty-one he was chosen professor of chemistry and natural philosophy at Dickinson College, Pennsylvania. After holding this post for three years, he went to Europe and took up the study of geology. Subsequently he was engaged for twenty-two years in the State surveys of Pennsylvania and New Jersey, his Reports on which were published during the years 1836-41. In 1842 he and his brother WILLIAM BARTON ROGERS (1805-1882), who had been similarly occupied in Virginia (his Reports were published in 1838-41), and he wrote also on the connexion between thermal springs and antecedent axes and faults), brought before the Association of American Geologists and Naturalists their conclusions on the physical structure of the Appalachian chain, and on the elevation of great mountain chains. The researches of H. D. Rogers were elaborated in his final Report on Pennsylvania (1858), in which he included a general account of the geology of the United States and of the coal-fields of North America and Great Britain. In this important work he dealt also with the structure of the great coal-field, the method of formation of the strata, and the changes in the composition of the coal from the bituminous type to anthracite. In 1857 he was appointed professor of natural history and geology at Glasgow. One of his later essays (1861) was on the parallel roads of Lochaber (Glen Roy), the origin of which he attributed to a vast inundation. He died at Glasgow on the 29th of May 1868.

ROGERS, JAMES EDWIN THOROLD (1823-1890), English economist, was born at West Meon, Hampshire, in 1823. He was educated at King's College, London, and Magdalen Hall, Oxford. After taking a first-class degree in 1846, he was ordained, and was for a few years a curate in Oxford. Subsequently, however, he resigned his orders. For some time the classics were the chief field of his activity. He devoted himself a good deal to classical and philosophical tuition in Oxford with success, and his publications included an edition of Aristotle's Ethics (1865). Simultaneously with these occupations he had been diligently studying economics, with
the result that in 1839 he was appointed professor of statistics and economic science at King's College, London, a post which he held till his death. From 1860 to 1867 he also held the position of Drudge, and professor of political economy at Oxford. During that period he published (in 1866) the first two volumes of his History of Agriculture and Prices in England, dealing with the period 1259-1400, a minute and masterly record of the subject, and the work upon which his reputation mainly rests. Two more volumes (1870-1872) were published in 1882, a fifth and sixth (1873-1875) in 1887, and he left behind him at his death copious materials for a seventh and eighth. In 1868 he published a Manual of Political Economy, and in 1869 an edition of Adam Smith's Wealth of Nations. In 1875 he collected and edited the Protests of the Lords. An intimate acquaintance with Cobden and John Bright led Rogers to take an active part in politics: he represented Southwark in parliament from 1880 to 1885, and Bermondsey from 1885-86, as an advanced Liberal. In 1888, on the death of Professor Bonamy Price, who had succeeded him at Oxford as professor of political economy, he was re-elected to the post, and held it till his death. Previously (in 1885) he had been appointed lecturer in political economy at the College, Oxford. His latter years were spent at Oxford, where he died on the 28th of October 1890. He was celebrated as a witty and humorous of his miscellaneous economic and historical writings, which were numerous, the most noteworthy is his Six Centuries of Work and Wages, published in 1884. As an economist, Thorold Rogers did much to promote the historical study of his subject. He was, however, apt to be guided too frequently by political prejudice, and the value of his work suffered from his aggressively contentious spirit.

ROGERS, JOHN (1627-1665), English preacher, second son of Nehemiah Rogers, a royalist and Anglican clergyman, was born at Messing in Essex, and became a servitor and student of medicine at King's College, Cambridge. When still a youth the violence of his religious despair led him to attempt suicide and ended in his joining the extreme sect of the Puritans. Deprived of his home in 1642, he walked to Cambridge, and found the college establishment broken up; he nearly starved, but obtained in 1643 a scholastic post in Lord Budgen's house in Huntingdonshire, and subsequently at St Neot's free school. He became known as a preacher, receiving an ordination in 1647, and was, in 1651, professor of Sir Robert Payne of Midlothian in Huntingdonshire, and obtained the living of Pulleigh in Essex. Subsequently he came to London, joined the Independents, became lecturer at St Thomas Apostle's, and attracted attention by the violence of his political sermons. He was appointed preacher to Christ Church Cathedral in Dublin by the parliament in 1651, and while there served in the field, returning in 1652 to St Thomas Apostle's on account of religious dissensions. In 1653 his parishioners at Pulleigh, where he had hitherto managed to retain the living, successfully proceeded against him for non-residence. In the quarrel between the army and the parliament Rogers had naturally sided with the former, and he was one of the first to join the Fifth Monarchy movement. He approved of the expulsion of the Long Parliament, and addressed two letters to Cromwell on the subject of the new government to be inaugurated, but the establishment of the Protectorate at once threw the Fifth Monarchy men into antagonism. Rogers addressed a warning letter to Cromwell, and boldly attacked him from the pulpit on the 9th of January 1654. This brought him to the attention of the authorities, and as a result Rogers then issued another denunciation against Cromwell, Mene, Tekel, Pera: a Letter lamenting over Oliver Lord Cromwell. On the 28th of March, on which day he had proclaimed a fast for the sins of the rulers, he preached a violent sermon against the protector, which occasioned his arrest in July. He confronted Cromwell with great courage when brought before him on the 5th of February 1655, and was imprisoned successively at Windsor and in the Isle of Wight, being released in January 1657. He returned to London, and, being suspected of a conspiracy, was again imprisoned by Cromwell in the Tower from the 3rd of February 1658 till the 16th of April. On the protector's death and the downfall of Richard Cromwell, the ideals of the Fifth Monarchy men seemed nearer realization, but Rogers was engaged in political controversy with Prynne and became a source of embarrassment to his own faction, which endeavoured to get rid of him by appointing him "to preach the gospel" in Ireland. On the outbreak of Sir George Booth's royalist insurrection, however, he became chaplain in Charles Fairfax's regiment, and served throughout the campaign. He obtained a lectureship at Shrewsbury in October and was in Dublin in January 1660, being imprisoned there by order of the army faction and released subsequently by the parliament. At the Restoration he withdrew to Holland, studied medicine at Leiden and Utrecht, and obtained from the latter university the degree of M.D. in 1662. He returned to England the same year and resided at Bermondsey, was admitted to the degree of M.D. at Oxford in 1664, and is supposed, in the absence of further record, to have died soon afterwards.

Besides the pamphlet already cited, Rogers wrote in 1655 Ohel or Bethkemesh, a Tabernacle for the Sun, in which he attacked the Presbyterians, and Saqir, or Doomsday drawing nigh, from his new standpoint as a Fifth Monarchy man, and was the author of Gideon; or the Heavenly Nymph (1653); Dod, or Chatan, the Beloved or the Bridegroom going forth for his Bride... (1653); Prison-born Morning Beams (1654); Jegaah Sahahudah... (1657); Mr Prynne's Good Old Man published and stunted to Year ago... (1659); Unparalleled Conferences; Meeting at the Tabernacle; Mr Harrington's Parallel Unparalleled (1659); A Vindication of Sir H. Vane (1659); Disputatio Medica Inauguralis (1662).

ROGERS, JOHN (c. 1500-1555), English Protestant martyr, was born in the parish of Aston, near Birmingham, and was educated at Pembroke Hall, Cambridge, where he graduated B.A. in 1526. Six years later he was rector of Holy Trinity, Queenhithe, London, and in 1534 went to Antwerp as chaplain to the English merchants. Here he met William Tyndale, under whose influence he abandoned the Roman Catholic faith, and married an Antwerp lady. After Tyndale's death Rogers pushed on with his predecessor's English version of the Old Testament to which he added a Chronicled the Coverdale's translation (1535) for the remainder and for the Apocrypha. Tyndale's New Testament had been published in 1526. The complete Bible was put out under the pseudonym of Thomas Matthew in 1537; it was printed in Antwerp, and Richard Grafton published the sheets and got leave to sell the edition (1500 copies) in England. Rogers had little to do with the translation, but he contributed some valuable prefaces and marginal notes. His work was largely used by those who prepared the Great Bible (1539-40), out of which in turn came the Bishop's Bible (1568) and the Authorized Version of 1611. After taking charge of a Protestant congregation in Wittenberg for some years, Rogers returned to England in 1548, where he published a translation of Melancthon's Considerations of the Augsburg Interim. In 1550 he was presented to the crown livings of St Margaret Myses and St Sepulchre in London, and in 1551 was made a prebendary of St Paul's, where the dean and chapter soon appointed him divinity lecturer. He courageously denounced the greed shown by certain courtiers with reference to the property of the suppressed monasteries, and defended himself before the court before being declowned and ordered to wear the prescribed vestments, donning instead a simple round cap. On the accession of Mary he preached at Paul's Cross commending the "true doctrine taught in King Edward's days," and warning his hearers against "pestilent Popery, idolatry and superstition." Ten days after (16th August 1553), he was summoned before the council and bidden to keep within his own house. His emoluments were taken away and his prebend was filled in October. In January 1554, Bonner, the new bishop of London, sent him to Newgate, where he lay with
JOHN HOOPER, Laurence Saunders, John Bradford and others for a year, their petition, whether for less rigorous treatment or for opportunity of stating their case, being like disregarded. In December 1554 parliament re-enacted the penal statutes against Lollards, and on January 22nd, 1555, two days after they took effect, Rogers with ten others came before the council at Gardiner's house in Southwark, and held his own in the examination that took place. On the 28th and 29th he came before the commission appointed by Cardinal Pole, and was sentenced to death by Gardiner for heretically denying the Christian character of the Church of Rome and the real presence in the sacrament. He awaited and met death (on the 4th of February 1555 at Smithfield) cheerfully, though denied even an interview with his wife. Noailles, the French ambassador, speaks of the support given to Rogers by the greatest part of the people: “even his children assisted at it, comforting him in such a manner that it seemed as if he had been led to a wedding. He was the first Protestant martyr of Mary’s reign, and his friend Bradford wrote that “he broke the ice valiantly.”

The following divines of the same name may be distinguished: JOHN ROGERS (1572–1575), “one of the most engaging preachers of the age.” JOHN ROGERS (1610–1680), ejected vicar of Crofton, Cumberland, and the founder of Congregational churches in Teesdale and Weardale, where he evangelized the lead miners. JOHN ROGERS (1679–1729), one of George Whitefield’s chaplains. In the controversy (1719), his Vindication of the Civil Establishment of Religion (1728), and his Persuasives to Conformity, addressed to Dissenters (1736) and to Quakers (1747).—JOHN ROGERS (1730–1814), leader of the pre-1756 divines, minister of Cahaba, Co. Monaghan.—JOHN ROGERS (1778–1886), rector of Mawan, Cornwall, and the owner of the Penrose and Helston estates; a good botanist and mineralogist, and a distinguished Hebrew and Syriac scholar.

ROGERS, JOHN (1820–1904), American sculptor, was born at Salem, Massachusetts, on the 30th of October 1829. In 1848 he became an apprentice in a machine shop at Manchester, New Hampshire, and remained there for about ten years. During the latter part of this time he had done some modelling in clay in his leisure hours, and, having decided to become a sculptor, he spent eight months in Rome and Paris in 1858–59. Becoming discouraged, he returned to America and obtained employment as a draughtsman in the office of the city surveyor of Chicago; but soon afterwards, owing to the favourable reception of his group of small figures, “The Checker Players,” he resumed sculptural work, confining himself to these small figures, known as “Rogers Groups,” which had an enormous popular success and were extensively reproduced. The Civil War in America gave him patriotic themes that increased his vogue and prosperity, and in 1863 he became a National Academician. His subjects were familiar scenes and incidents of home life known to the masses, and the reproductions of his groups were sold in the most remote districts as well as in the larger cities. He executed several life-sized statues, including “General John F. Reynolds” and a seated figure of Lincoln, both in Philadelphia; but it is by his statuettes that he is best remembered, and these were characterized by sentiment and human interest rather than any genuine artistic feeling. He died at New Haven, Connecticut, on the 27th of July 1904.

ROGERS, ROBERT (1727–1754), American frontier soldier, was born of Irish parentage in 1727, probably at Methuen, Massachusetts, whence his father, James Rogers (often confused with James Rogers, an early settler of Londonderry, N.H.), removed in 1739 to Starktown (now Dunbarton), New Hampshire. During the Seven Years’ War he raised and commanded a force of militia, known as Rogers’ Rangers, which won a wide reputation for its courage and endurance in the engagements about Lake George. He took part in Wolfe’s expedition against Quebec, and on the 4th of October 1759 he destroyed an Abnaki Indian village on the St Francis river near its mouth and killed about 200 of its inhabitants. After the Montreal campaign of 1760, in which he served, he was sent by General Amherst to take possession of the north-western posts, occupied Detroit on the 29th of November, and later returned to the east. In 1763, during the Pontiac uprising, he accompanied the relief expedition under James Dalvay to Detroit and took part in the battle of Bloody Bridge on the 21st of July (see Pontiac). Soon after this he went to England, and in 1765 published in London a Concise Account of North America, containing a Description of the Several British Colonies...also an Account of the Several Nations and Tribes of Indians (new edition, Albany, 1883). In 1766–68 he was commander of Michilimackinac. He spent the next few years in England, and after 1772 was in the service of the day of Algiers. At the beginning of the War of Independence he returned to America, and in spite of his protestations of patriotism was considered by Washington and others a Loyalist spy. He was arrested by agents of Congress, but was paroled. His arrest he considered a release from his parole. He then opened his own examination at General Howe organized a regiment of Loyalists which was known as the Queen’s Rangers, and which after his return to England in 1776 was commanded by Capt. John G. Simcoe. In 1779 he was commissioned to raise a regiment to be called the King’s Rangers, and he returned for a short time to America; but the command of the corps he belonged to was offered to the garrison of St John’s, Quebec, was taken by his brother James (d. 1792), who had formerly served under Robert. Rogers died in London probably in 1784.

In addition to the Concise Account of North America, he published his Journals (London, 1765), and is supposed to have written, at least in part, Ponteuch, or the Savages of America, a Tragedy (London, 1766). See also his “Journal” in The Diary of the Siege of Detroit in the War with Pontiac (Albany, 1860; new edition, 1883), edited by F. B. Hough; and Francis Parkman, Montcalm and Wolfe (2 vols., Boston, 1884).

ROGERS, SAMUEL (1763–1853), English poet, was born at Newington Green, London, on the 30th of July 1763. His father, Thomas Rogers, was the son of a Stourbridge glass manufacturer, who was also a merchant in Cheapside. Thomas Rogers had a place in the London business, and married Mary, the only daughter of his father’s partner, Daniel Radford, becoming himself a partner shortly afterwards. On his mother’s side Samuel Rogers was connected with the two well-known Nonconformist divines, Philip and Matthew Henry; and it was in Nonconformist circles at Stoke Newington that he was brought up. He was educated at private schools at Hackney and Stoke Newington. He wished to enter the Presbyterian ministry, but at his father’s desire he joined the banking business in Cornhill. In long holidays, necessitated by delicate health, Rogers became a diligent student of English literature, particularly in Johnson, Gray and Goldsmith. Gray’s poems, he said, he had by heart. He had already made some contributions to the Gentleman’s Magazine, when in 1786 he published a volume containing some imitations of Goldsmith and an “Ode to Superstition” in the manner of Gray. In 1788 his elder brother Thomas died, and Samuel’s business responsibilities were increased. In the next year he paid a visit to Scotland, where he met Adam Smith, Henry MacKenzie, the FIOZZIS and others. In 1791 he was in Paris, and enjoyed a hurried inspection of the art collection of Philippe Égalité at the Palais Royal, many of the treasures of which were later on to pass into his possession. With Gray as his model, Rogers took great pains in polishing his verses, and six years elapsed after the publication of his first volume before he printed his elaborate poem on The Pleasures of Memory (1792). This poem may be regarded as the last embodiment of the poetic diction of the 18th century. Here is carried to the extremest pitch the theory of elevating and refining familiar themes by abstract treatment and lofty imagery. In this art of “raising a subject,” as the 18th-century phrase was, the Pleasures of Memory is much more perfect than Thomas Campbell’s Pleasures of Hope, published a few years later in imitation. The acme of positive praise for the fashionable serious poetry of the time was given by Byron when he said, “There is not a vulgar line in the poem.”

In 1793 his father’s death gave Rogers the principal share in the banking house in Cornhill, and a considerable income.
He left Newington Green in the same year and established himself in chambers in the Temple. In his circle of friends at this time were "Conversation" Sharp and the artists Flaxman, Opie, Martin Shee and Fuseli. He also made the acquaintance of Charles James Fox, with whom he visited the galleries in Paris in 1802, and whose friendship introduced him to Holland House. In 1803 he moved to 22 St James's Place, where for fifty years he entertained all the celebrities of London. Flaxman and Stothard had a share in the decorations of the house, which Rogers had almost rebuilt, and now proceeded to fill with pictures and other works of art. His collections at his death realized £50,000. An invitation to one of Rogers's breakfasts was a formal entry into literary society, and his dinners were ever more select. His social success was due less to his literary position than to his powers as a conversationalist, his educated taste in all matters of art, and no doubt to his sarcastic and bitter wit, for which he excused himself by saying that he had such a small voice that no one listened if he said pleasant things. Above all, he seems to have had a genius for benevolence. "He certainly had the kindest heart and unkindest tongue of any one I ever knew," said Fanny Kemble. He helped the poet Robert Bloomfield, he superintended Moore's "Lalla Rookh", and with Byron and De Quincey, and relieved Sheridan's difficulties in the last days of his life. Moore, who refused help from all his friends, and would only be under obligations to his publishers, found it possible to accept assistance from Rogers. He procured a pension for H. F. Cary, the translator of Dante, and obtained for Wordsworth his sinecure as distributor of stamps.

It is difficult to realize the length of time that Rogers played the part of literary dictator in England. He made his reputation by The Pleasures of Memory when Cowper's fame was still in the making. He became the friend of Wordsworth, Scott and Byron, and lived long enough to give an opinion as to the fitness of Alfred Tennyson for the post of poet laureate. Alexander Dyce, from the time of his first introduction to Rogers, was in the habit of writing down the anecdotes with which his conversation abounded. From the mass of material thus accumulated he made a selection which he arranged under various headings and published in 1856 as Recollections of the Table-Talk of Samuel Rogers, in which is added Reminiscences. Rogers himself kept a notebook, in which he entered impressions of the conversation of many of his distinguished friends—Charles John Fox, Edmund Burke, Henry Grattan, Richard Porton, John Horne Tooke, Talleyrand, Lord Erskine, Sir Walter Scott, Lord Grenville and the duke of Wellington. They were published by his nephew William Sharpe in 1859 as Recollections by Samuel Rogers; and Reminiscences and Table-Talk of Samuel Rogers, Banker, Poet, and Patron of the Arts, 1763-1855 (1903), by G. H. Powell, is an amalgamation of these two authorities. Rogers held various honorary positions: he was one of the trustees of the National Gallery; and he served on a commission to inquire into the management of the British Museum, and on another for the rebuilding of the Houses of Parliament.

Meanwhile his literary production was slow. A poem of some autobiographical interest, An Epistle to a Friend (Richard Sharp), published in 1798, describes Rogers's idea of a happy life. This was followed twelve years later by The Voyage of Columbus (1810), and by Jaquette (1818), a narrative poem, written in the four-ace measure of the newer writers and published in the same volume with Byron's Lara. His reflective poem on Human Life (1819), on which he had been engaged for twelve years, is written in his earlier manner.

In 1814 Rogers made a tour on the Continent with his sister Sarah. He travelled through Switzerland to Italy, keeping a full diary of events and impressions, and had made his way to Naples when the news of Napoleon's escape from Elba obliged him to hurry home. Seven years later he returned to Italy, paying a visit to Byron and Shelley at Pisa. Out of the earlier of these tours arose his last and longest work, Italy. The first part was published anonymously in 1822; the second, with his name attached, in 1828. The production was at first a failure, but Rogers was determined to make it a success. He enlarged and revised the poem, and commissioned illustrations from J. M. Turner, Thomas Stothard and Samuel Prout. These were engraved on steel in the sumptuous edition of 1830. The book then proved a great success, and Rogers followed it up with an equally sumptuous edition of his Poems (1838). In 1830, on Wordsworth's death, Rogers was asked to succeed him as poet laureate, but declined the honour on account of his great age. For the last five years of his life he was confined to his chair in consequence of a fall in the street. He died in London on the 18th of December 1855.

A full account of Rogers is given in two works by P. W. Clayden, The Early Life of Samuel Rogers (1885) and Rogers and His Contemporaries (2 vols., 1889). One of the best accounts of Rogers, containing many examples of his caustic wit, is by Abraham's History of Literature in the Edinburgh Review for July 1856. See also the Aldine edition (1857) of his Poetical Works, and the Journals of Byron and of Moore.

ROGERS, WILLIAM (1810-1899), English clergyman and educational reformer, was born in London on the 24th of November 1810, the son of a barrister. Educated at Eton and at Balliol College, Oxford, he entered Durham University in 1828, and took the degree of B.A. and was ordained in 1833. In 1845 he was appointed to St Thomas's Charterhouse, where he remained for eighteen years, throwing himself passionately into the work of education of his poor, degraded and often criminal parishioners. He began by establishing a school for ragamuffins in a blacksmith's abandoned shed, and with the generous help of friends he gradually extended its scope until the whole parish was a network of schools. In 1858 he was appointed a member of the Royal Commission to inquire into popular education, and he was returned a representative of the London School Board after the passing of Forster's Act in 1870. In 1863 the bishop of London 'gave him the living of St Botolph Bishopsgate. Rogers was also made a prebendary of St Paul's, and in 1857 he had been appointed Chaplain in Ordinary to the Queen. Having largely solved at St Thomas's the problem of elementary education, at Bishopsgate Rogers tackled the no less difficult one of middle-class schools. He believed in secular education, leaving doctrinal training to parents and clergy. To the cry against "godless education," Rogers impulsively replied, "Hang theology; let us begin!" and his maxim, "Hang-theology Rogers" stuck to him for the rest of his life. The Bishopsgate Schools, costing £20,000, were the practical result of his energy. His next great work was the reconstruction of Edward Alleyn's charity at Dulwich. The new college was opened in 1879; new buildings were erected for the lower school, and the lion's share of the work fell upon Rogers. The culmination of his labours was the opening, on his seventy-fifth birthday, of the Bishopsgate Institute, including a hall, with accommodation for 500 people and a reference and lending library. On the same day a portrait and gift of plate was made him at the Mansion House, before a distinguished gathering. Lord Rosebery, then Prime Minister, observed in his speech that though bishops and deaneries had not been the rector's lot, there was not a poor Jew in Houndsditch or Petticoat Lane whose face would not brighten when he saw him coming. When he died, on the 19th of January 1896, this might have served as an appropriate epitaph.

ROGIER, CHARLES LATOUR (1800-1885), Belgian statesman, descended from a Belgian family settled in the department of the Nord in France, was born at Stenay on 7th August 1800. His father, an officer in the French army, had died in the Russian campaign of 1812; and the family moved to Liège, where the eldest son, Firmin, held a professorship. Charles, after being called to the Bar, founded, in collaboration with his lifelong friends, Paul Devaux and Joseph Lebeau, the journal Mathieu Lemaenserg (afterwards Le Politique), which by its ardent patriotism and its attacks on the Dutch administration soon acquired a widespread influence. When the Insurrection of 1830 broke out at Brussels, Rogier put himself at the head of 150 Liégeois, and inscribing on his banner the motto,
"Vaincre ou mourir pour Bruxelles," he obtained arms from a local factory, and marched upon the capital. Here he took his place at once among the leaders of the revolutionary party. His influence saved the townhall from pillage on 10th September. On the 24th a commission administrative was formed, of which Rogier became president. The energetic measures of this body and of its successor, the gouvernement provisoire, soon freed the greater part of the country from the Dutch troops. Rogier was sent in October to suppress an outbreak among the followers of Hainaut, and then as delegate of the provisional government to Antwerp, where the citadel still held out for Holland. He succeeded in arranging an armistice, and then, in the exercise of the absolute power with which he was invested, reorganized the entire administration of the city. He sat for Liège in the National Congress, voted for the establishment of a hereditary monarchy, and induced the congress to adopt the principle of an elective second chamber. In the long-drawn debates on the bestowal of the crown he ranged himself on the side of Louis Philippe: he first supported the candidature of Otto of Bavaria, and on his rejection declared for the duc de Nemours. Finally, when Louis Philippe declined the crown on behalf of his son, Rogier voted with the majority for Leopold of Saxe-Coburg. In June 1831 he was appointed governor of the province of Antwerp, a post rendered exceptionally difficult by the continued presence of Dutch troops in the citadel. In October 1832 he became minister of the interior in the Goblet-Devaux cabinet. In the following July he intervened in a quarrel in the chamber of deputies between Devaux and the Opposition leader, Alexandre Gendebien, claimed a prior right to give satisfaction, and fought a duel, in which he was severely wounded. During his term of office he carried, in the teeth of violent opposition, a law that established in Belgium the first railways on the continent of Europe, and thus laid the foundation of her industrial development. Owing to dissensions in the cabinet, he retired in 1834, together with Lebeau, and resumed the governorship of Antwerp. On Lebeau's return to power in 1840, Rogier became minister of public works and education. The proposals that he made in the latter capacity were defeated by the determined opposition of the Clerical party, and on the resignation of the ministry in 1841, Rogier gave his support to a compromise on the subject of education, which passed into law in 1842. He led the Liberal party in Opposition till 1847, when he formed a cabinet in which he held the ministry of the interior. He at once embarked on a programme of political and economic reform. He took effective steps to remedy the industrial distress caused by the decay of the Flemish linen trade. The limitation of the franchise was extended; and as a result of the liberal policy of the government the country alone escaped the revolutionary wave that spread over the Continent in 1848. He passed a law in 1850 organizing secondary education under the control of the State, and giving the clergy only the right of religious instruction. The Clerical party, though unable to defeat this measure, succeeded in shaking the position of the cabinet; and it was finally undermined, after Prince Louis Napoleon's coup d'état of 1851, by the hostility of the French government, which found its political allies welcomed by the liberal cabinet at Brussels. Rogier retired in October 1852, but was brought back into office by the liberal reaction of 1857. He again became president of the council and minister of the interior in a cabinet of which Frère-Orban was the most conspicuous member. The first important measure passed by the ministry was one for the fortification of Antwerp. In 1860 the fear of French designs on the independence of Belgium led to a movement of reconciliation with Holland, and inspired Rogier to write the only one of his numerous poems that is likely to survive, his national anthem, "La Nouvelle Brabançonne." Some of the ministers resigning in 1861, on the question of recognizing the kingdom of Italy, the cabinet was reconstructed, and Rogier exchanged the ministry of the interior for that of foreign affairs. In this capacity he achieved a diplomatic triumph in freeing the navigation of the Scheldt, and thus enabling Antwerp to become the second port on the mainland of Europe. Defeated at Dinant, he sat for Tourna from 1865 till his death. His younger and more energetic colleague, Frère-Orban, gradually overshadowed his chief, and in 1868 Rogier finally retired from power. He continued, however, to take part in public life, and was elected president of the extraordinary session of the chamber of representatives in 1878. From this time his age, his devoted patriotism and the unassuming simplicity of his life made him the idol of all classes. The fiftieth anniversary of the kingdom of Belgium in 1880, and two years later that of his entry into parliament, were the occasion of demonstrations in his honour. He died at Brussels on the 27th of May 1885, and his remains were accorded a public funeral.

See T. Juste, Charles Rogier, 1800-1885, d'après des documents inédits (Verviers, 1885).

ROGUE, a word which came into use about the middle of the 16th century as a slang or "cant" term for a vagrant vagabond, answering to the modern "tramp," and was adopted into English legal phraseology together with "vagabond" in the Statute of Elizabeth 1572, "rogue and vagabond" and "incorrigible rogue" remaining as legal terms for certain classes of persons amenable to the law under the Vagrancy Acts (see VAGRANCY). The act of Elizabeth defined "rogues, vagabonds and sturdy beggars" as including "idle persons going about and using subtle craft and unlawful games and all persons whole and sound in body and not masters, having neither land nor master, not able to give an account how they get their living and all common labourers using loitering and refusing to work for the wages commonly given." (Sir G. Nicholls' History of the English Poor Law, ed. 1898 by H. G. Willink, vol. i. 159.) The word has now the general meaning of a knave or rascal, though also used (by meiosis) as a term of playful or tender banter and in various special applications (e.g. a "rogue" elephant, one who has been driven out by the herd and lives a solitary life, becoming very savage and destructive. Gardeners also apply the word to a plant which does not come true from seed, showing some variation from the type).

The derivation of the word has been much disputed. It has usually been referred to Fr. rogue, meaning proud, arrogant, which is variously derived from the Icelandic broke, rook, long-winded talker, or Breton rok, proud, haughty; cf. Irish and Gaelic rucas, pride. The New English Dictionary, however, rejects this derivation, and considers possible a connexion with another early "cant" word "roger," a begging vagabond pretending to be a poor university scholar.

ROHAN, the name of one of the most illustrious of the feudal families of France, derived from that of a small town in Morbihan, Brittany. The family appears to have sprung from the viscounts of Porhoët, and claims connexion with the ancient sovereigns of Brittany. Since the 12th century it held an important place in the history of Brittany, and strengthened its position by alliances with the greatest houses in France. It was divided into several branches, the eldest of which, that of the viscounts of Rohan, became extinct in 1527. Of the younger branches the most famous is that of Guéméné, from which sprang the branches of Montbazon, Soubise and Gié. The seigneurs of Frontenay, an offshoot of this last branch, inherited by marriage the property of the eldest branch of the house. Hercule de Rohan, duc de Montbazon (1568-1654) served Henry III, and Henry IV, against the League, and was made by Henry IV, governor of Paris and the Isle of France, and master of the hounds. His grandson, Louis de Rohan-Guéméné, the chevalier de Rohan, who was notorious for his dissolute life, conspired with the Dutch against Louis XIV, and was beheaded in Paris in 1674. In the 18th century the Soubise branch furnished several prelates, cardinals and bishops of Strassburg; among others the famous cardinal de Rohan, the king of the affair of the diamond necklace. The seigneurs of Gié, a branch founded by Pierre de Rohan (1455-1513), a cadet of the branch of Guéméné and marshal of France, were conspicuous on the Protestant side during the wars of religion. René de Rohan, seigneur of Pontivy and Frontenay, commanded the Calvinist army in 1570, and
ROHAN, DUC DE—ROHAN, CARDINAL DE

ROHAN, Henri, Duc de (1579–1638), French soldier, writer and leader of the Huguenots, was born at the château of Blain, in Brittany, in 1579. His father was René, count of Rohan (1549–60), and head of one of the oldest and most distinguished families in France, which was connected with many of the reigning houses of Europe. He was educated by his mother, who was a woman of exceptional learning and force of character. Rohan was by birth the second son, but his elder brother René dying young he became the heir of the name. He appeared at court and in the army at the age of sixteen, and was a special favourite with Henry IV., after whom, failing the house of Condé, he might be said to be the natural chief of the French Protestants. Having served till the peace of Vervins, he travelled for a considerable time over Europe, including England and Scotland, in the first of which countries he received the not unique honour of being called by Elizabeth her knight, while in the second he was godfather at Charles I’s christening. On his return to France he made duke and peer at the age of twenty-four, and two years later (1603) married Marguerite de Béthune, the duc de Sully’s daughter. He served in high command at the celebrated siege of Jülich in 1610, but soon afterwards he fell into active or passive opposition to the government over the religious disputes. For a time, however, he abstained from actual insurrection, and he endeavoured to keep on terms with Marie de’ Medici; he even, despite his dislike of De Luynes, the favourite of Louis XIII., reappeared in the army and fought in Lorraine and Piedmont. It was not till the decree for the restitution of church property in the south threw the Bearness and Gascons into open revolt that Rohan appeared as a rebel. His authority and military skill were very formidable to the royalists; his constancy and firmness greatly contributed to the happy issue of the war for the Huguenots, and brought about the treaty of Montpellier (1629). But Rohan did not escape the results of the incurable factiousness which showed itself more strongly perhaps among the French Huguenots than among any other of the numerous armed oppositions of the 17th century. He was accused of lukewarmness and treachery, though he did not hesitate to renew the war when the compact of Montpellier was broken. Again a hollow peace was patched up, but it lasted but a short time, and Rohan undertook a third war (1627–29), the first events of which are recounted in his celebrated Mémoirs. This last war (famous for the defence of La Rochelle by Soubise, Rohan’s younger brother) was one of considerable danger for Rohan. In spite of all efforts he had in the end to sign a peace, and after this he made his way quickly to Venice. Here he is said to have received from the Porte the offer of the sovereignty of Cyprus. It is more certain that his hosts of Venice wished to make him their general-in-chief, a design not executed owing to the peace of Caracas (1631). At Venice he wrote his Mémoirs, and throughout the years when France began to play a more conspicuous part in the Thirty Years’ War Rohan was again called to serve his lawful sovereign, and entrusted with the war in the Valtelline. The campaign of 1633 was completely successful, but Rohan was still considered dangerous to France, and was soon again in retirement. At this time he wrote his Traité du gouvernement des treize cantons. Rohan fought another Valtelline campaign, but without the success of the first, for the motives of France were now held in suspicion. The unfortunate commander retired to Geneva and thence went to the army of Bernhard of Saxe-Weimar. He received a mortal wound at the battle of Rheinfelden on the 28th of February 1638, and died at the abbey of Königsfeld, canton Berne, on the 13th of April. His body was buried at Geneva, and his arms were solemnly handed over to the Venetian government. With his daughter Marguerite the honours of the family of Rohan-Gié passed to the house of Chabot.

Rohan’s Mémoires sur les choses qui se sont passées en France, &c., rank amongst the best products of the singular talent for memoir-writing which the French noblesse of the 16th and 17th centuries possessed. All the same, in cleanness of matter and in shrewdness, they deserve very high praise. The first three volumes dealing with the civil wars, appeared in 1644; the fourth, containing the narrative of the Valtelline campaigns, not till 1758. Some suspicions were thrown on the genuineness of the latter, but, though it would seem, of Rohan’s hand. His famous book on the history and art of war, Le Parfait Capitaine, appeared in 1631 and subsequently in 1637 and 1693 (see also Quincy, Art de la guerre, Paris, 1711). It treats of the history and lessons of Caesar’s campaigns and their application to modern war, and contains appendices dealing with phalanx and legionary methods of fighting and the art of war in general. He also wrote an account of his travels, the book on Switzerland mentioned above, De Sceaux et la Suisse, which may be conveniently found in the collection of Michaud and Pouljoulet, vol. 19.

See Fauvel de Poix, Histoire du Duc Henri de Rohan (Paris, 1736); Schwaberg, Le Duc de Rohan and la charte du parti protestant en France (Paris, 1880); Bühring, Venedig, Gustav Adolf, und Rohan (Halle, 1885); Laugel, Henri de Rohan, son rôle politique et militaire (Paris, 1899); Veraguth, Herzog Rohan et ses mission en Graubünden (Berne, 1894); and Shadwell, Mountain Warfare.

ROHAN, Louis René Édouard, Cardinal de (1734–1809), prince de Rohan-Guéméné, archbishop of Strasbourg, was born at Paris on the 25th of September 1734. Members of the Rohan family had filled the office of archbishop of Strasbourg from 1704—an office which made them princes of the empire and the compeers rather of the German prince-bishops than of the French ecclesiastics. For this high office Louis de Rohan was destined from his birth, and soon after taking orders, in 1760, he was nominated coadjutor to his uncle, Constantine de Rohan-Rochefort, who then held the archiepiscopal, and he was also consecrated bishop of Canopus. But he preferred the elegant life and the gaiety of Paris to his clerical duties, and had also an ambition to make a figure in politics. He joined the party opposed to the Austrian alliance, which had been cemented by the marriage of the archichurch Marie Antoinette to the dauphin. This party was headed by the duc d’Aiguillon, who in 1771 sent Prince Louis de Rohan. His special embassy to Vienna to find out what was being done there with regard to the partition of Poland. Rohan arrived at Vienna in January 1772, and made a great noise with his lavish fêtes. But the empress Maria Theresa was implacably hostile to him; not only did he attempt to thwart her policy, but he spread scandals about her daughter Marie Antoinette, laughed at herself, and shocked her ideas of propriety by his dissipation and luxury. On the death of Louis XV. in 1774, Rohan was recalled from Vienna, and coldly received at Paris; but the influence of his family was too great for him to be neglected, and in 1777 he was made grand almoner, and in 1778 abbot of St Vaast. In 1778 he was made a cardinal on the nomination of Stanislaus Poniatowski, king of Poland, and in the following year succeeded to the archiepiscopal see as archbishop of Strasbourg and became abbot of Noirmoutiers and of Chablis. His various preferments brought him in an income of two and a half milionalers; yet the cardinal was restless and unhappy until he should be reinstated in favour at court and had appealed the animosity which Marie Antoinette felt against him. In pursuit of this object he fell into the hands of a gang of intrigurers, the comtesse de Lamotte, the notorious Caglloste and others, whose actions
form part of the "affair of the diamond necklace." This story is disentangled elsewhere (see DIAMOND NECKLACE), and diverging views are still taken of it. Rohlfs certainly was led to believe that his attentions to the queen were welcomed, and that his arrangement by which she received the famous necklace was approved. He was the dupe of others, and at the trial in 1786 before the parlement his acquittal was received with universal enthusiasm, and regarded as a victory over the court and the unpopular queen. He was deprived, however, of his office as grand almoner and exiled to his abbey of Chaise-Dieu. He was soon allowed to return to Strassburg, and his popularity was shown by his election in 1789 to the states-general by the clergy of the bailliages of Haguenau and Weissenburg. He at first declined to sit, but the states-general, when it became the national assembly, insisted on validating his election. But as a prince of the church in January 1791 he refused to take the oath to the constitution, and went to Ettenheim, in the German part of his diocese. In exile his character improved, and he spent what wealth remained to him in providing for the poor clergy of his diocese who had been obliged to leave France; and in 1801 he resigned his nominal rank as archbishop of Strassburg. On the 17th of February 1803 he died at Ettenheim, the abbé Georges, the baroness d'Oberkirch, of Beugnot, and of Madame Campan; and works cited under DIAMOND NECKLACE.

ROHILKHAND—ROTIK

ROHILKHAND, a tract in the United Provinces of India. The name is associated with the Rohilla tribe (q.v.), but in its historical significance it covers an area almost coincident with the modern division of Bareilly, for which it is a common alternative title. This division has an area of 10,720 sq. m., and comprises the districts of Bareilly, Bijnor, Budana, Mora-dabad, Shahjahanpur and Pilibhit. Pop. (1901) 5,479,688. Political control over the state of Rampur is exercised by the commissioner for the division.

ROHILLA (a Pushtu word for "mountaineer"), a tribe of Afghan marauders, who, towards the beginning of the 18th century, conquered a district of Hindostan, giving it the name of Rohilkhand, which still survives as an alternative title of the Bareilly division of the United Provinces. The Rohillas are chiefly notable for their association with Warren Hastings, which formed one of the main causes in the impeachment of Hastings. Rohtak, the capital of the Rohillas, was the scene of the Rohilla war, which had appealed for aid to Shuja-ul-Dowlah, wazir of Oudh, and ally of the British. The wazir promised to assist them in return for a sum of money; but when the Maharrattas were driven off the Rohilla chiefs refused to pay. The wazir then decided to annex their country, and appealed to Hastings for assistance, which was given in return for a sum of forty lakhs of rupees. Hastings justified his action on the ground that the Rohillas were a danger to the British as uncovering the flank of Oudh; and while he would never involve the company in an unjust war, neither did he desire an unprofitable one. The Rohillas were defeated by Colonel Champion in April 1774, and the majority of them fled across the Ganges; but the charges of destroying a nation, brought against Hastings by Burke and Macaulay, were greatly exaggerated. The Rohillas were never a nation, but consisted of a small body of Mahomedans, who had imposed an alien rule upon a million Hindus; and one of their chiefs was left in possession of a tract which now forms the state of Rampur (q.v.). See CHARLES HATTON, A History of the Rohilla Afghans (1787); and Sir J. Strachey, Hastings and the Rohilla War (Oxford, 1892).

ROHLS, FRIEDRICH GERHARD (1831–1896), German explorer of the Sahara, son of a physician, was born at Vege- sack, near Bremen, on the 14th of April 1831. After the ordinary course at the gymnasium of Osnabrück he entered the Bremen corps in 1848, and took part as a volunteer in the Schleswig-Holstein campaign, being made an officer after the battle of Idstedt (July 1850). He became a medical student at the universities of Heidelberg, Würzburg and then Göt- tingen; but his natural inclination was for travelling, and in 1855 he went to Algeria and enlisted in the Foreign Legion. He took part in the conquest of Kabylia, and was decorated for bravery as Chevalier of the Legion of Honour. Having made himself master of Arabic and gained a thorough knowledge of native customs, Rohlfs went to Morocco in 1861; presenting himself as a Musulman, he gained the favour of the enlightened sultan of Wazanan, and was thus enabled to travel over the length and breadth of the country. He then entered the Sahara and traversed the entire extent of the Wad Draa, being the second European (the first being René Caillié) to visit Tafilet. On leaving Tafilet he was robbed by his guides and left for dead; but two marabouts charitably succored him and he was able to reach Algeria. When scarcely recovered from his wounds he started once more for the Sahara (August 1862) by way of Algeria. Compelled by tribal disturbances to turn back, he went to Tangier and thence in March 1864 made a fresh start. Crossing the Atlas by an eastern route he again visited Tafilet, and thence made his way across the desert to the oasis of Tuat, which he was the first European to describe. Returning by Ghadames and Tripoli he spent three months in Germany, and then (March 1865) went back to Tripoli, intending to explore the highlands of the Sahara, being prevailed on by the sultan of Shuja-ud-Dowlah to return to the Wad Draa. On his way back he crossed the Wad Hamar, captivated the sultan of Tureg, and returned to Tripoli. On his return he spent five months, and thence across the Sahara to Bornu, mapping en route the oasis of Kawar. Rohlfs passed through Mandara and its ancient capital Mora, and struck out for the coast of the Gulf of Guinea. He reached the Benue by way of the Baudi highlands, and descended that river to its confluence with the Niger, which he ascended to Kebbi. Thence he made his way on horseback to Lagos, reaching Liverpool on the 2nd of July 1867. In the following year he accompanied the British expedition against Theodore of Abyssinia, and on his return went once more to Tripoli, whence he traversed the Cyrenaica, reaching Egypt by way of the oasis of Siwa (1866). Returning home, he married and settled down in Weimar. He did not rest long, however, for in 1873–74 he took command of an expedition sent by the Khedive Ismail into the Libyan Desert, which made investigations of great value to science. In 1879 Rohlfs and Dr Stecker were commissioned by the German African Society to go to Wadai. They succeeded in reaching the Kohr Harar, being preceded chiefly by the Obeidens and the Senussi, but being attacked by the Arabs, they were obliged to retreat, making their way to the coast at Benghazi, reached in October 1879. In 1880 Rohlfs accompanied Dr Stecker in an exploring expedition to Abyssinia; but after delivering a letter from the German emperor to the Negus, he returned to Europe. In 1885, when the rivalry between the British and Germans in East Africa was very keen, Prince Bismarck appointed Rohlfs consul at Zanzibar, which island Bismarck desired to secure for Germany. Rohlfs, untrained in diplomacy, was no match for Sir John Kirk, the British Agent, and he was soon recalled, and did not again visit Africa. He died at Rüngsdorf, near Bonn, on the 2nd of June 1896. Rohlfs visited many regions not before traversed by Europeans, and the value of his work was recognized in 1868 by the Royal Geographical Society, which bestowed on him the Patron's Medal.

Accounts of some of his expeditions, and other works on Africa were published by Rohlfs, including Mein Erster Aufenthalt in Marokko (Bremen, 1873; English edition, Travels in Morocco, London, 1874); Reise durch Marokko (Bremen, 1868); Quer durch Afrika (Leipzig, 1874–75); Von Tripolis nach Alexandria (Bremen, 1871); Expedition zur Erforschung der Libyschen Wüste (Cassell, 1880); Reise von Tripolis nach der Basis der Sahara (Leipzig, 1881); Land und Volk in Afrika (Bremen, 1870); Quid novi ex Africa? (Cassel, 1886). See also a biographical notice by Dr W. Venkenhoven in the Deutsche gebl. Blatter für 1896.

ROHTAK, a town and district of British India, in the Delhi division of the Punjab. The town, which is of great antiquity, became the headquarters of a British district in 1824. Viewed from the sandhills to the south, Rohtak, with its white mosque in the centre, a fort standing out boldly to the east, is striking and picturesque. It has a station on the Southern Punjab
railway, 44 m. N.W. of Delhi. Pop. (1901) 29,323. It is an important trade centre, with factories for grinding and pressing cotton, and a specialty in muslin turbans.

The district of Rohtak has an area of 1797 sq. m. It is situated in the midst of the level tableland between the Jumna and the Sutlej, forming one unbroken plain of hard clay copiously interspersed with light yellow sand, and covered in its wild state by a jungle of scrubby brushwood. The only natural reservoir for its drainage is the Najafgarh Jthi, a marshy lake lying within the boundaries of Delhi. The Sahibi, a small stream from the Ajmere hills, traverses a corner of the district, and the northern portions are watered by the Rohtak and Butana branches of the Western Jumna canal; but the greater portion of the central plain, comprising about two-thirds of the district area, is entirely dependent upon the uncertain rainfall. The climate, though severe in point of heat, is generally healthy; the rainfall averages annually about 20 in.

The population in 1901 was 630,672, showing an increase of 6.8% in the decade. The principal crops are millets, wheat, barley, pulses, cotton and sugar-cane. The district is traversed by the line of the Southern Punjab railway from Delhi to Jind, and by the Rohtak and Butana branches of the Rajputana railway. It is peculiarly exposed to drought, suffering in the famine of 1866–67, and yet more severely in 1890–1900, when the highest number of persons relieved was 33,632 in March 1900.

Rohtak was formerly included within the region known as Hariana. The district, with the other possessions of Sindhi west of the Jumna, passed to the British in 1803. Until 1832 Rohtak was under the administration of a political agent, resident at Delhi, but in that year it was brought under the general regulations and annexed to the North-Western Provinces. The outbreak of the Mutiny in 1857 led to its abandonment, when the mutineers attacked and plundered Rohtak, destroying every record of administration. It was not until after the fall of Delhi that the authority of the British government was permanently restored. Rohtak was then transferred to the Punjab.

**ROJAS ZORRILLA, FRANCISCO DE** (1607–c. 1660), Spanish dramatist, was born at Toledo; the only circumstance recorded of him is that he became a knight of Santiago in 1644. The exact date of his death is unknown. His plays were published in 1640–45; the best of his dramatic compositions, Del Rey abajo Ninguno, is not included in the collection and was printed separately under the title of Garcia del Castañar. Of his other pieces, apart from their intrinsic merit, an international interest attaches to No hay padre siendo rey, which was borrowed by Rotrou for his Venceslas; To donde hay agravios no hay selos and the Amo criado, which were imitated by Scarron in his Jodellet Soufflet and Maître Valet; to Entre Bobos anda el juego, the source of Thomas Cornelle's Don Bertrand de Cigrall, as well as of Scarron's Don Japhet d'Armenie; to Obligados y ofendidos, from which are derived Les Généruses Ennemis by Boisrobert, Les Illustres Ennemis by Thomas Cornelle, and Scarron's Écologer de Salamanque; and to La tracion busca el castigo, upon which are based Vanbrugh's False Friend and Le Sage's Tristré puni. Rojas Zorrilla's power of conveying a tragic impression is manifest in Garcia del Castañar; his chief defect is his persistent predilection for diction.

**ROKITANSKY, CARL** (1804–1878), the founder of the Vienna school of pathological anatomy, was born on the 19th of February 1804 at Königgrätz in Bohemia. He studied medicine at Prague and at Vienna, graduating at the latter place in 1828. Soon afterwards he became assistant to Johann Wagner, the professor of pathological anatomy, and succeeded him in 1834 as prosector, being at the same time made extraordinary professor. It was not until ten years later (1844) that he reached the rank of full professor. To his duties as a teacher he added in 1847 the onerous office of medico-legal anatomist to the city, and from 1863 he filled an influential office in the ministry of education and public worship, wherein he had to advise on all routine matters of medical teaching, including patronage. A seat in the upper house of the Reichsraat rewarded his public labours in 1867, and on his retirement the cottage at Rotthau, where he was born, was made a monument to his memory. In 1874 he was made commander of the Order of Leopold. He joined the Imperial Academy of Sciences as a member in 1848, and became its president in 1860. He was president also of the medical society of the Austrian capital and an honorary member of many foreign societies. On his retirement at the age of seventy his colleagues celebrated the occasion by a function in the aula of the university, where his bust was unveiled. In his leave-taking speech he said that work had always been a pleasure to him and pleasures mostly a toil. His death in Vienna on the 23rd of July 1878 elicited many expressions of affection and of esteem for his upright character. Two of his sons became professors at Vienna, one of astronomy and another of medicine, while a third gained distinction on the lyceum stage.

With Rokitansky's name is associated the second great period of the medical school of Vienna, its first success having been identified with the liberal patronage of it by Maria Theresa and with the fame of Van Swietzen. It dates from 1844 onwards, when the Viennese surgical school became the second and third volumes, containing succinct descriptions of the visible changes and abnormalities in the several organs and parts of the body. Whenever Rokitansky touched the vital problems of general pathology, he did so with the disinterested mind of the anatomist, and by clinical experience, with the solid basis of the doctor. His mind was like that of another anatomist, Harlaem, in that it was clear, composed, and methodical; and his life work is characterized by a strong and constant inclination for logical method. Rokitansky's publications are famous for the precision and reliability of their observations, and for the invincible authority with which he deduces his conclusions.

The immediate outcome of Rokitansky's close application to the work of the dead-house was his Handbuch der pathologischen Anatomie (1842–46), in 3 vols., of which the first was published in 1842. This work was the foundation of the third and second volumes, containing succinct descriptions of the visible changes and abnormalities in the several organs and parts of the body. Whenever Rokitansky touched the vital problems of general pathology, he did so with the disinterested mind of the anatomist, and by clinical experience, with the solid basis of the doctor. His mind was like that of another anatomist, Harlaem, in that it was clear, composed, and methodical; and his life work is characterized by a strong and constant inclination for logical method. Rokitansky's publications are famous for the precision and reliability of their observations, and for the invincible authority with which he deduces his conclusions.

Rokitansky's work is characterized by a strong and constant inclination for logical method. Rokitansky's publications are famous for the precision and reliability of their observations, and for the invincible authority with which he deduces his conclusions.

Next to his Handbuch, of which the Sydenham Society published an English translation in 4 vols. (1849–52), his most important writings were four memoirs in the Denkschriften of the Vienna Academy, of which three, dealing with the anatomy of arteries, changes in the heart, and the pathogenesis of certain diseases, were published in 1842; the fourth, De rationali et animali vita (1845), was the first to be published in English. His work is characterized by a strong and constant inclination for logical method. Rokitansky's publications are famous for the precision and reliability of their observations, and for the invincible authority with which he deduces his conclusions.

Rokitansky's work is characterized by a strong and constant inclination for logical method. Rokitansky's publications are famous for the precision and reliability of their observations, and for the invincible authority with which he deduces his conclusions.

**ROLAND [ROLAND DE LA PLATIÈRE], JEAN MARIE** (1734–1793), French statesman, was born at Thizy on the 18th of February 1734. He received a good education, and early formed the studious habits which remained with him through life. Proposing to seek his fortune abroad, he went on foot to Nantes, but was there prostrated by an illness so severe that all thoughts of emigration were perforg abandoned. For some years he was employed as a clerk; thereafter he joined a relative who was inspector of manufactures at Amiens, and he himself speedily rose to the position of inspector. To these two employments may be ascribed those qualities of assiduity and
ROLAND, J. M.

463

accuracy, and that familiarity with the commerce of the country, which distinguished his public career. In 1782 he married Manon Jeanne Philon (1754–1793), and the name of Madame Roland is synonymous with this name. She was the daughter of Gratien Philon, a Paris engraver, who was ambitious, speculative and nearly always poor. From her early years she showed great aptitude for study, an ardent and enthusiastic spirit, and unquestionable talent. She was to a considerable extent self-taught, and her love of reading made her acquainted first with Plutarch—a passion for which she continued to cherish throughout her life—thereafter with Bossuet, Massillon, and authors of a like stamp, and finally with Montesquieu, Voltaire and Rousseau. These studies marked stages of her development, and as her mind matured she abandoned the idea of a convent which for a year or two she had entertained, and added to the enthusiasm for a republic which she had imbibed from her earlier studies not a little of the cynicism and the daring which the later authors inspired. She almost equalled her husband in knowledge, and infinitely excelled him in talent and in tact. Through and with him she exercised a singularly powerful influence over the destinies of France from the outbreak of the Revolution till her death.

For four years after their marriage Roland lived at Amiens, he being still an inspector of manufactures; but his knowledge of commercial affairs enabled him to contribute articles to the Encyclopédie Nouvelle, in which, as in all his life work, he was assisted by his wife. On their removal to Lyons the influence of both became wider and more powerful. Their fervent political aspirations could not be concealed, and from the beginning of the Revolution they threw in their lot with the party of advance. The Courrier de Lyon contained articles the success of which reached even to the capital and attracted the attention of the Parisian press. They were from the pen of Madame Roland and were signed by her husband. A correspondence sprang up with Brissot and other friends of the Revolution at headquarters. In Lyons their views were publicly known; Roland was elected a member of the municipality, and when the depression of trade in the south demanded representation in Paris he was deputed by the council of Lyons to ask the Constituent Assembly that the municipal debt of Lyons, which had been contracted for the benefit of the state, should be regarded as national debt. Accompanied by his wife, he appeared in the capital in February 1791. He remained there until September, frequenting the Society of the Friends of the Constitution, and entertaining deputes of the most advanced opinions, especially those who later became the leading Girondists. Madame Roland took an active part in the political discussions in these reunions.

In September 1791, Roland’s mission being executed, they returned to Lyons. Meanwhile the inspectorships of manufactures had been abolished; he was thus free; and they could no longer remain absent from the centre of affairs. In December they again reached Paris. Roland became a member of the Jacobin Club. They had made many and influential friends in advance, and Madame Roland’s salon soon became the rendezvous of Brissot, Pétion, Robespierre and other leaders of the popular movement, above all of Buzot, whom she loved with platonic enthusiasm. In person Madame Roland was attractive though not beautiful; her ideas were clear and far-reaching, her manner calm, and her power of observation extremely acute. It was almost inevitable that she should find herself in the centre of political aspirations and presiding over a company of the most talented men of progress. The rupture had not yet been made evident between the Girondist party and that section still more extreme, that of the Mountain. For a time the whole left united in forcing the resignation of the ministers. When the crisis came the Girondists were ready, and on the 23rd of March 1792 Roland found himself appointed minister of the interior. As a minister of the crown Roland exhibited a bourgeois brusqueness of manner and a remarkable combination of political prejudice with administrative ability. While his influence could not increase the latter, it was successfully exerted to foment and embitter the former. He was ex officio excluded from the Legislative Assembly, and his declarations of policy were thus in writing—that is, in the form in which she could most readily exert her power. A great occasion was invented. The decrees against the emigrants and the non-juring clergy still remained under the veto of the king. A letter was penned by Madame Roland and addressed by her husband to Louis. It remained unanswered. Thereupon, in full council and in the king’s presence, Roland read his letter aloud. It contained many and terrible truths as to the royal refusal to sanction the decrees and as to the king’s position in the state; but it was inconsistent with a minister’s position, disrespectful if not insolent in tone. Roland’s dismissal followed. Then he completed the plan: he read the letter to the Assembly; it was ordered to be printed, became the manifesto of disaffection, and was circulated everywhere. In the demand for the reinstatement of the dismissed ministers were found the means of humiliation, and the prelude to the dethronement of the king.

After the insurrection of the 10th of August, Roland was recalled to power, one of his colleagues being Danton. But now he was dismayed by the progress of the Revolution. He was above all a provincial, and was soon in opposition to the party of the Mountain, which aimed at supremacy not only in Paris but in the government as well. His hostility to the insurrectional commune of Paris, which led him to propose transferring the government to Blois, and his attacks upon Robespierre and his friends rendered him very unpopular. His neglect to seal the iron chest discovered in the Tuileries, which contained the proofs of Louis XVI’s relations with the enemies of France, led to the accusation that he had destroyed a part of these documents. Finally, in the trial of the king he demanded, with the Girondists, that the sentence should be pronounced by a vote of the whole people, and not simply by the Convention.” He resigned office on the 23rd of January 1793, two days after the king’s execution.

Although now extremely unpopular, the Roland’s remained in Paris, suffering abuse and calumny, especially from Marat. Once Madame Roland appeared personally in the Assembly to repel the falsehoods of an accuser, and her ease and dignity evoked enthusiasm and compelled acquittal. But violence succeeded violence, and early on the morning of the 1st of June she was arrested and thrown into the prison of the Abbeville. Roland himself escaped secretly to shelter in Rouen. Released for an hour from the Abbeville, she was again arrested and thrown among the horrors of Saint-Pélagie. Finally, she was transferred to the Conciergerie. In prison she won the affections of the guards, and was allowed the privilege of writing materials and the occasional visits of devoted friends. She there wrote her Appel à l’impartialité posthume, those memoirs which display a strange alternation between self-laudation and patriotism, between the trivial and the sublime. On the 8th of November 1793 she was conveyed to the guillotine. Before yielding her head to the block, she bowed before the clay statue of Liberty erected in the Place de la Révolution, uttering her famous apostrophe—“O Liberty! what crimes are committed in thy name!” When Roland heard of his wife’s condemnation, he wandered some miles from his refuge in Rouen; maddened by despair and grief, he wrote a few words expressive of his horror at those massacres which could only be inspired by the enemies of France, protesting that “from the moment when I learned that they had murdered my wife I would no longer remain in a world stained with enemies.” He affixed the paper to his breast, and unhesitatingly a sword-stick fell upon the weapon, which pierced his heart, on the 10th of November 1793.

Madame Roland’s Mémoires, first printed in 1820, have been edited among others by P. Faugère (Paris, 1864), by J. C. Clairès (Paris, 1884), and by C. Perroud (Paris, 1905). Some of her Lettres inédites have been published by C. A. Dauban (Paris, 1867), and a critical edition of her Lettres by
C. Perroud (Paris, 1900–2). See also C. A. Dauban, Étude sur Madame Roland et son temps (Paris, 1864); V. Lamy, Deux femmes célèbres, Madame Roland et Charlotte Corday (Paris, 1884); C. Bader, Madame Roland, d’après des lettres et des manuscrits inédits (Paris, 1892); A. J. Lambert, Le mariage de Madame Roland, trois années de correspondance amoureuse (Paris, 1896); Austin Dobson, Four Frenchwomen (London, 1890); and articles by C. Perroud in the review La Révolution française (1896–99).

ROLAND, LEGEND OF. The legend of the French epic hero Roland (transferred to Italian romance as Orlando) is based on authentic history. Charlemagne invaded Spain in 778, and had captured Pampeluna, but failed before Saragossa, when the news of a Saxon revolt recalled him to the banks of the Rhine. On his retreat to France through the defiles of the Pyrenees, part of his army was cut off from the main body by the Basques, who had ambushed in a narrow defile, and now drove the rear-guard into a valley where it was surrounded and entirely destroyed. The Basques, after plundering the baggage, made good their escape, favoured by the darkness and by their knowledge of the ground. The incident is related in the Annales (Pertz i. 159) commonly ascribed to Einhard, and with more detail in Einhard’s Vita Karoli (cap. ix; Pertz ii. 448), where the Basques are called Egghard, praepositus of the royal table; Anselm, count of the palace; and Hrودland, praefect of the Breton march. . . .

The scene of the disaster is fixed by tradition at Roncesvaux, on the road from Pampeluna to Saint Jean Pied de Port. There is no foundation in this story for the fiction of the twelve peers, which may possibly arise from a still earlier tradition. In 636–37, according to the Chronicles of Fredegarius (ed. Krusch p. 159), twelve chiefs, whose names are given, were sent by Dagobert against the Basques. The expedition was successful, but in an engagement fought in the valley of Subola, or Robola, identified with Mauléon, which is not far from Roncesvaux, the Duke Haremont, with other Frankish chiefs, was slain. Later fights in the same neighbourhood and under similar circumstances are related in 813 (Vita Hludowici; Pertz ii. 616), and especially in 824 (Einhard’s Annales; Pertz i. 213). These incidents no doubt served to strengthen the tradition of the disaster to Charlemagne’s rear-guard in 778, the importance of which was perhaps underrated by the Frankish historians and was certainly magnified in popular story. The author of the Vita Hludowici, writing sixty years after the battle of Roncesvaux, thought it superfluous to give the names of the fallen chiefs, as being matter of common report.

Growth of the Legend.—The choice of Roland or Hrودland as the hero of the story probably points to the borders of French Brittany as the home of the legend. The exaggeration of a rear-guard action into a national defeat; the substitution of a vast army of Saracens, the enemies of the Frankish nation and the Christian faith, for the border tribe mentioned by Einhard; and the vengeance inflicted by Charlemagne, where in fact the enemy escaped with complete impunity—all are in keeping with the general laws of romance. Charlemagne himself appears as the ancient epic monarch, not as the young man he really was in 778. The earliest version of the legend which we possess dates no earlier than the 11th century, but there is abundant evidence of the existence of a continuous tradition dating from the original event, although its methods of transmission remain a vexed question. Roncesvaux lay on the route to Compostella, and the many pilgrims who must have passed the site from the middle of the 9th century onwards may have helped to spread the story. Whether the actual cantilena Rolandi chanted by Taillefer at the battle of Hastings (William of Malmesbury, De gestis regum angl. iii. 242, and Wace, Br. vi. 1435 seq.) was a version of the Chanson de Roland cannot be stated, but the choice of the legend on this occasion by the trouvère is proof of its popularity.

The oldest extant forms of the legend are: (a) chapters xix–xxx. of the Latin chronicle, known as the Pseudo-Turpin, which purports to be the work of Turpin, archbishop of Reims, who died about 800, but probably dates from the 12th century; (b) Carmen de proditione Gismonis, a poem in Latin distichs; and (c) the Chanson de Roland, a French chanson de geste of about 1400 lines, the oldest recension of which is in the Bodleian Library, Oxford (MS. Digby 23). It is in assonanced tirades, of unequal length, many of them terminated with the refrain Aoi. This MS. was written by an Anglo-Norman scribe about the end of the 12th century, and is a corrupt copy of a text by a French trouvère of the middle of the 11th century. It concludes with the words: “Ci falt la geste, que Turoldus decline.” There was a Turol (d. 1098) who was abbot of Peterborough; another was tutor to William the Conqueror and died in 1035. Even if we could identify this personage, we cannot tell whether he was the poet, the minstrel or the scribe of the MS., but it seems likely that he was merely the scribe. The poem, which was first printed by Francisque Michel (Oxford, 1837), is the finest monument of the heroic age of French epic. In its fundamental features it evidently dates back to the reign of Charlemagne, who is not represented as the capricious despot of the later chansons de geste, but as governing in accordance with Frankish custom, accepting the counsel of his barons, and carrying out the curious procedure of Frankish law. Roland represents the monarchical idea, and was evidently, in its primitive form, written before the feudal revolts which weakened the power of the Carolingian successors. Its unity of conception, the severity and conciseness of the language, the directness, vividness and sobriety of the narrative, place it far above the chansons of later troubadours, with their wordiness and their loose, episodic construction. With the exception of the small place allotted to Alde, women have practically no place in the story, and the romantic element is thus absent. Roland’s master-passions are daring and an exaggerated conception of honour, the extravagance of which is the cause of the disaster. His address to Oliver before the battle is typical of the warlike spirit of the poem:—

“Notre empreuuer qui ses Francs nous laissa,
Tels vingts milles hommes a pour nous mis à part,
Qu’il sait très bien que pas un n’est couard.
Pour son seigneur grands maux on souffrira,
Terribles froids, grands chauds endurcirens,
Et de son sang, de sa chair on perdra!
Brandis ta lance; et moi, ma Dureland,
Ma bonne épée, que le Roi me donna.
Et si je meurs, peut-être qui l’aura!
C’était l’œil d’un très noble vasal.”

(pt. Petit de Jullièvre xi. 1114 seq.)

The Story as related in the Chanson de Roland.—Charlemagne, after fighting for seven years in Spain, had conquered the whole country with the exception of Saragossa, the seat of the Saracen king Marsile. He was encamped before Cordova when he received envoys from the Saracen king, sent to procure the evacuation of Spain by the Franks through false offers of submiss. Charlemagne held a council of his barons, Naimes of Bavaria, Roland, Turpin, Ogier, Ganelon and the rest. Roland, the emperor’s nephew, was eager for war; the peace party was headed by Ganelon of Mayence. The Franks were weary of campaigning, and Ganelon’s counsels won the day. At the suggestion of Roland, Ganelon, who was his stepfather, was entrusted with the embassy to Marsile—a sufficiently perilous errand, since two former envoys had been beheaded by the Saracens. Ganelon, inspired by hatred of Roland and Oliver, agreed with Marsile to betray Roland and his comrades for ten mule-loads of gold. He then returned to Charlemagne bearing Marsile’s supposed assent to the Frankish terms. The retreat began. Roland, at Ganelon’s instigation, was placed in command of the rear-guard. With him were the rest of the famous twelve peers,3 his companions-in-arms, Oliver, Gérin, Gérir, Oton, Bérentirg, Samson, Anésis, Girard

3Ganelon may perhaps be identified with Wenilo, archbishop of Sens, whose treason against Charles the Bald is related in the Annales Bertinianae (ann. 859).

4 The lists vary in different texts.
de Roussillon, Engelier the Gascon, Ivon and Ivoire, and the flower of the Frankish army. They had nearly reached the summit of the pass when Oliver, who had mounted a high rock, saw the advancing army of the Saracens. Securing his own safety, Olivier begged Roland to sound his horn and summon Charlemagne to his aid. A description of the battle, a series of single combats, follows. Oliver, with his sword Hautecloque, rallied Roland with Durendal. After the first fight, a second division of the pagan army appears, then a third. Roland's army was reduced to sixty men before he consented to sound his horn. Presently all were slain but Roland and Oliver, Turpin and another. Finally, when the Saracens, warned of the return of Charlemagne, had retreated, Roland alone survived on the field of battle. With a last effort he blew his horn once more, and heard before he died the sound of Charlemagne's battlecry of "Montjoie." Charlemagne pursued the enemy, and destroyed their army. The raising of a second army by Baltiug, the emir of Babylon, and its defeat by the emperor, who slays Balitug in single combat, is obviously an interpolation in the original narrative. The troubadour then relates the return of the Franks, the burial of the heroes, the marriage of Roland and Giselbert at Aix, his interview with an army of the Saracens, his victory over them, the death of Alde, Roland's betrothed and Oliver's sister, when she heard the news of Roland's death. The trial of Ganelon is one of the most curious parts of the story, providing, as it does, a full account of the Frankish criminal procedure.

Relations between the Earlier Forms of the Legend.—The Pseudo-Turpin represents a different recension of the story, and is throughout clerical in tone. It was the troubadour of the Chanson de Roland who developed the characters into epic types; he invented the heroic friendship of Roland and Oliver, the motives of Ganelon's treachery, and many other details. The famous fight between Roland and the giant Ferragus appears in the Pseudo-Turpin (chapter xviii.), but not in the poem. The Chanson de Roland presupposes the existence of a whole cycle of epic poetry, probably in episodic form; it contains allusions to many events outside the narrative, some of which can be explained from other existing chansons, while others refer to narratives which are lost. In lines 500-603 of the poem the Rock gives a list of the countries he has conquered for Charles, from Constantinople and Hungary on the east to Scotland on the west. Of most of these exploits no trace remains in extant poems, but his capture of Bordeaux, of Nobles, of Carcassonne, occur in various compilations. Roland was variously represented by the romancers as the son of Charlemagne's sister Giles or Berte and the knight Milton d'Angles. The romantic episode of the reconciliation of the pair with Charlemagne through Roland's childish prattle (Berte et Milton) is probably foreign to the original legend. In the Scandinavian versions Roland is the son of Charlemagne and his sister, a recital probably borrowed from mythology. His enfants, or youthful exploits, were, according to Aspremont, performed in Italy against the giant Eamounet, but in Giraud de Viane his first taste of battle is under the walls of Vienne, where Oliver, at first his adversary, becomes his brother-in-arms.

Other Versions.—Most closely allied to the Oxford Roland are (a) a version in Italianized French preserved in a 13th or 14th century MS, in the library of St. Mark, Venice (MS. Fr. iv c); (b) the Dutch Liet (ed. W. Grimm, Göttlingen, 1838) of the Swabian priest Konrad (fl. 1130), who gave, however, a pious tone to the whole; (c) the 8th branch of the Karlomagnus-saga (ed. C. Unger, Christiania, 1892) and version of the Friesland sáda.

In the 12th century the Chanson de Roland was modernized by replacing the assonance by rhyme, and by amplifications and additions. Several MSS. of this rhymed recension, sometimes known as Roncevaux, are preserved. In the prose compilations of Galien and in David Abbott's Conquesies de Charlemagne (1458) the story kept its popularity for many centuries. In England the story was understood in the original French, and the English romances of Charlemagne (g.v.) are mostly derived from late and inferior sources. In Spain the legend underwent a curious transformation. Spanish patriotism created a Spanish ally of Marsile, Bernard del Castello, and the story was transferred to Spain. Thus the story of the Roland legend had its greatest fortune: Charlemagne and Roland appear in the Paraíso (canto xviii.) of Dante; the statues of Roland and Oliver appear on the doorway of the cathedral of Verona; and the French chansons de geste regularly appeared in a corrupt Italian form. The French tradition of the Roland legend is enriched by the numerous editions of revisions, and, as the Spagna, forming the 8th book of the great compilation of Carolingian romance, the Reali di Francia, kept its popularity down to the Renaissance. The story of Roland (Orlando) in a greatly modified form is the subject of the poems of Luigi Pulci (Morgante Maggiore, 1481), of Matteo Boiardo (Orlando innamorato, 1456), of Ariosto (Orlando furioso, 1516), and of Francesco Berni (Orlando, 1541).

Rolandseck, a village of Germany, in the Prussian Rhine province, delightfully situated on the left bank of the Rhine, 5 m. above Bonn, with a station on the railway Cologne-Coblentz. The place consists almost entirely of villas and is a favourite summer resort. Crowning the vine-clad hill behind it lie the ruins of the castle, a picturesque ivy-covered arch, whence a fine view is obtained of the Siebengelirge and the Rhine valley as far as Bonn. Immediately below Rolandseck in mid-river is the island of Nonnenwerth, on which is a nursing school under the conduct of Franciscan nuns, established in 1850. The convent which formerly stood here was founded in 1222 and secularized in 1802. Tradition assigns the foundation of the castle of Rolandseck to Charlemagne's paladin, Roland. It was certainly built at a very early date, as it was restored by Frederick, archbishop of Cologne, in 1120, and it was a fortress until the end of the 15th century.

Roll, Alfred Philippe (1856— ), French painter, was born in Paris on the 1st of March 1846. Pupil of Gérôme and Bonnat at the École des Beaux Arts, he made his début at the Salon in 1870 with "Environments of Baccarat" and "Evening," and attracted the widest attention in 1875 by his colossal painting of "The Flood at Toulouse" (now at the Haye Museum). All his early work is imbued with the spirit of Raphael and the optimism under the influence of Géricault, whilst his colour tended to Bolognese heaviness with a strong leaning towards dark shadows in the flesh painting, in which he closely followed Courbet. In 1877 he showed at the Salon the "Fête de Silenus" (now at the Ghent Museum), a painting of such vivid colour and exuberant life that it recalls the work of Jordaan. About this time he began to devote himself to the realistic rendering of modern life, especially among the working classes, and together with romantic subjects he abandoned his earlier heavy colouring, and devoted himself to the study of free light. His "Miners' Strike" of 1880 (now at the Valenciennes Museum) placed him in the front rank of modern French painters, and from that date his career was one of continuous and brilliant success. He became "official painter" to the
ROLL—ROLLE DE HAMPOLE

French government, and was entrusted with numerous commissions for the decoration of public buildings and for commissions of pictures, like the "President Carnot at Versailles at the Centenary of the États Généraux" (now at Versailles Palace), and "The Tsar and President Faure laying the Foundation Stone of the Alexandre III. Bridge." For the Hôtel de Ville he executed "The Pleasures of Life" and "The Rosetine of Youth." Besides the pictures already mentioned, a vast number of his works are to be found in the public galleries of France. The museum of the Hôtel de Ville in Paris owns his "National Fête at Paris in 1880"; the Cognac Museum, "Labour, Works at Suresnes"; the Luxembourg, his "War" and "Manda Lametrie, farm-hand." At Avignon Museum is the "Don Juan and Haldée"; at Laval Museum, "Hallt!"; at Fontainebleau Palace, "In Normandy"; at Pau Museum, "Rouhey, cementer"; and at the Museum of Geneva, "Marianne Offrey, creampie de vert." In portraiture he is known by his "Yves Guyot," "Coquelin cadet," "Jules Simon," &c., but, his greatest success was the group of "Fritz Thaulow and his Wife." In 1905 he replaced Carolus-Duran as president of the Société Centenaire des Beaux-Arts, of which he was one of the founders.

ROLL (O. Fr. rolle, roule, mod. rôle, Lat. rotula, dim. of rotis, wheel), something rolled or wound up in a cylindrical form on an axis, or something which "rolls," that is, moves or is moved along a service by a turning motion. Primarily the word is used of a piece of writing material, such as parchment or paper, rolled up for the purpose of convenient storage, handling, &c. This is the meaning of the Med. Lat. rotula, defined by Du Cange as "Scheda, charta in speciem rotulae seu rotae convoluta." It was thus the convenient name for any document kept in this form as an official record, and hence for any register, record, catalogue or official list. "The Rolls" was the name of the building where the records of the Chancery Court were kept, the keeper of which was the Master (q.v.) of the Rolls, now the title of the third member of the English Supreme Court of Judicature. Other familiar examples of the use of the word in this sense are the list of those admitted as qualified solicitors, whereby the phrase "to strike off the rolls," of removal by the court of a solicitor for offences or delinquencies. There are numerous applications of the word to other objects packed in a cylindrical form, such as tobacco, cloth, &c., and particularly to a small loaf of bread rolled over before baking, the crust being thin and crisp and the crumb spongy.

In architecture a "roll" or "scroll" moulding is a moulding resembling a section of a roll or scroll of parchment with the end overlapping; a "roll and fillet" moulding is a section of a cylindrical moulding with a square fillet running along the centre of the face (see LABEL). For the sense of an object that rolls, the word "roller" is more general, but "roll" is frequent in technical usage for revolving cylinders, especially when working in fixed bearings. For the rolling of steel see ROLLING MILL.

ROLLAND, JOHN (fl. 1560), Scottish poet, appears to have been a priest of the diocese of Glasgow, and to have been known in Dulkeith in 1555. He is the author of two poems, the Court of Venus and the translation of the Seven Sages. The former, which was printed by John Ros in 1575, may have been written before 1560. The latter was translated from a Scots prose version at the suggestion of an aunt ("one proper wenche"), who had found his treatment of the courtly allegory involved and uninteresting.

The Court of Venus was edited by Walter Gregor for the S.T.S. in 1881. See W. A. Craigie's long list of corrections of that edition in the Modern Language Quarterly (March 1898). The Seven Sages was printed in 1578, and frequently during the earlier decades of the 17th century in London by the chapmen of the British Museum (1837). Sibbald, in his Chronicle of Scottish Poetry (iii. 287), hinted that Rolland may be the author of the Three Priests of Plebis. There is not a scrap of evidence in support of this assertion. There are many strong reasons against the ascription.

ROLLE DE HAMPOLE, RICHARD (d. 1349), English hermit and author, was born near the end of the 13th century, at Thornton (now Thornton Dale), near Pickering, Yorkshire. His father, William Rolle, was perhaps a dependant of the Neville family. Richard was sent to Oxford at the expense of Thomas de Neville, afterwards archdeacon of Durham. At Oxford he gave himself to the study of religion rather than to the subtleties of scholastic philosophy, for which he professed a strong distaste. At the age of nineteen he returned to his father's house, and, making a rough attempt at a hermit's dress out of two kirtles of his sister's and a hood belonging to his father, he ran away to follow the religious vocation. At Dalton, near Rotherham, he was recognized by John de Dalton, who had been at Oxford with him. After satisfying himself of Rollle's sanctity, Dalton's father provided him with food and shelter and a hermit's dress. Rolle then entered on the contemplative life, passing through the preliminary stages of purification and illumination, which lasted for nearly three years, and then entering the stage of sight, the full revelation of the divine vision. He is very exact in his dates, and attains, he says, the highest stage of his ecstasy four years and three months after the beginning of his conversion. Richard belonged to no order, but was a hermit of the mediaeval type, and wandered from place to place, resting where he found friends to provide for his wants. He seems to have desired to form a rule of hermits, but met with much opposition. The pious compilers of his "office" evidently thought it necessary to defend him against the charge of mere vagrancy. He nowhere says himself that his preaching made many converts, but his example was followed by many recluses in the north of England. After some years of wandering he gave up his more energetic propaganda, contenting himself with advising those who sought him out. He began also to write the songs and treatises by which he was to exert his widest influence. He settled in Richmondshire, twelve miles from the recluse Margaret Kirkby, whom he had cured of a violent seisure. To her some of his works are dedicated. Finally he removed to Hampole, near Doncaster, invited by an inmate of the Cistercian nunnery of St Mary. There he died on the 29th of September 1349. Many miracles were wrought at his shrine, and, in view of an expected canonization, an effort was made during his lifetime giving an account of his life and the legends connected with it.

Richard Rolle had a great influence on his own and the next generation. In his exaltation of the spiritual side of religion over its forms, his enthusiastic celebration of the love of Christ, and his assertion of the individualistic principle, he represented the best side of the influences that led to the Lollard movement. He was himself a faithful son of the church, and the political activity of the Lollards was quite foreign to his teaching. The popularity of his devotional writings is attested by the numerous existing editions and by the many close imitations of them.

A very full list of his Latin and English works is given (pp. 36-43) in Dr Carl Horstmann's edition (1895-96) of his works in the Library of Early English Writers. Some of his works exist in both English and Latin, and it is often not easy to say which is the original version. The most considerable of them are the Prick of Conscience and his Commentary on the Psalms.

The Prick of Conscience is a long religious poem, in rhyming couplets, dealing with the beginning of man's life, the instability of the world, why death is to be dreaded, of doomsday, of the pains of hell, and the joys of heaven, the two latter subjects being treated with a certain amount of optimism. He calls upon the reader to think and believe, but southern transcripts are also found, and the poem exists in a Latin version (Stimulus conscientiae). The sources of this work included the De Contemptu Mundi and the miseriae humanae conditions of Bishop Pelham. Richard Rolle also showed a knowledge of Bartholomew Glanville, Thomas Aquinas and Honorius of Autun. His English devotional commentary on the Psalms follows very closely his Latin Expositio Psalmitae, which he partly based on Peter Lombard's Commentary on the Psalms, and which appeared in three MSS. in the British Museum (Cotton Vesp. D. vii., Egerton 614, and Harl. 1770). Dr R. F. Littlechild in his edition (1875) of J. M. Neale's Commentary on the Psalms called it a "terse mystical paraphrase, which often comes very short in beauty and depth of Didymus the Carthusian himself."

There is no complete and accessible edition of his works. The best collection is by J. H. Horstmann, Yorkshire Writers; Richard Rolle of Hampole; An English Father of the Church and his Followers.
ROLLER—ROLLIN

(2 vols., 1895–96), in the "Library of Early English Writers." This includes many English prose treatises by Rolle, some beautiful examples of his lyric poems, and other treatises in prose and verse from northern Mers., some of which are attributed to Rolle, and others to his father. In 1506, the latter, one of the most famous of his Latin works, was translated (1433–35) by Richard Mynyn (ed. R. Harvey, Early English Text Soc., 1890). The Prickes of Conscience was edited (1665) by Richard Morris for the Philological Society. His Commentary on the Psalms was edited by the Rev. H. R. Bramley (Oxford, 1884). Ten prose treatises by Richard Rolle from the Thornton MS. (c. 1440, Lincoln Cathedral Library) were edited by Canon George Perry for the Early English Text Soc., (1863). Two letters of his Latin works are described Paris (1510), Antwerp (1533), Cologne (1535–36), Paris (1618); and in vol. xxvi. of the "Bibliotheca Patrum Maxima" (Lyons, 1677). The office, which forms the chief authority for Rolle's life, is from the Surtees Soc., 1882, and in Canon Perry's edition referred to above.

Middendorff (Magdeburg, 1888), with a list of MSS., sources, &c.; J. Zupitza in Englische Studien (Heilbronn, vols. vii. and xii.); A. Hahn, Quellenuntersuchungen zu Richard Rolle's Englischen Schriften (Halle, 1900); and for his proscy, C. Saintsbury, Hist. of English Prose, vol. i.

ROLLER, a very beautiful bird, so called from its way of occasionally rolling or turning over in its flight,1 somewhat after the fashion of a tumbler-pigeon. It is the Coracias garrulus of ornithology, and is widely though not very numerous spread over Europe and Western Asia in summer, breeding so far to the northward as the middle of Sweden, but retiring to winter in Africa. It occurs almost every year in some part or other of the British Islands, from Cornwall to the Shetlands, while it has visited Ireland several times, and is even recorded from St Kilda. But it is only as a wanderer that it comes, since there is no evidence of its having ever attempted to breed in Great Britain; and indeed its conspicuous appearance—for it is nearly as big as a day and very brightly coloured—would forbid its being ever allowed to escape a gun. Except the back, scapulars and tertials, which are bright reddish-brown, the plumage of both sexes is almost entirely blue, of various shades, from pale blue to dark ultramarine, tinted in different shades of green. The bird seems to be purely insectivorous. The genus Coracias, for a long while placed by systematists among the crows, has really no affinity whatever to them, and is now properly considered to belong to the heterogenous group of birds now associated as Coraciiformes, in which it forms the type of the family Coraciidae; and its alliance to the bee-eaters (Meropidae) and king-fishers (Alcedinidae) (q.v.) is very evident. Some eight other species of the genus have been recognized, one of which, C. boisaeophalus or C. abyssinicus, is said to have occurred in Scotland. India has two species, C. indicus and C. affinis, of which hundreds upon thousands used to be annually destroyed to supply the demand for gaudy feathers to bedizen ladies' dresses. One species, C. temmincki, seems to be peculiar to Celebes and the neighbouring islands, but otherwise the rest are natives of the Ethiopian or Indian regions. Allied to Coracias is the genus Euryzostus with some half-dozen species, of similar distribution, but one of them, E. pacificus, has a wider range, for it inhabits Australia and reaches Tasmania.

Madagascar has four or five very remarkable forms which have often been called Coracias by naturalists, the most important of which, according to A. Milne-Edwards, no doubt should exist on that point. Yet if any may be admitted it is in regard to one of them, Leptosomus discolor, which, on account of its zygodyactylyous feet, some authorities place among the Cuculidae, while others have considered it the type of a distinct family Leptosomatidae. The genera Braschiolophus and Atelornis present fewer structural characters to point to its being a Coracias, or perhaps may be rightly placed with them; but the species of the latter have long tarsi, and are believed to be terrestrial habit, which rollers generally certainly are not. These very curious and in some respects very interesting forms, which are peculiar to Madagascar, are admirably described and illustrated by a series of twenty plates in the great work of A. Grandidier and A. Milne-Edwards on that island (Oiseaux, pp. 223–239), while the whole family Coraciidae is the subject of a monograph by H. E. Dresser, as a companion volume to his monograph on the Meropidae. (A. N.)

ROLLER. For agricultural purposes the roller formerly consisted of a solid cylinder of timber or stone attached to a frame and shafts, but to facilitate turning two or more iron cylinders revolving on an axle are now generally used. The earliest form has a smooth surface. The drum of the roller should be as great as possible—30 in. being a good size—because the larger this is the more easily it is pulled (within certain limits), while rollers of small diameter are heavier of draught and do their work less efficiently. The implement is used in spring and summer as an aid in pulverizing and cleaning the soil, by bruising clods and heaps of tangled roots and earth which the cultivator or other implement has brought to the surface; in smoothing the surface for the reception of small seeds or the better operation of the mower or reaper; in consolidating, soil that is too loose in texture and pressing it down about the roots of young plants. In the case of young plants the roots are close to the surface, which must therefore be kept moist. This end is attained by the compression by the roller of the top-soil of which the capillarity, i.e. the power of drawing water from the sub-soil is thereby increased. On the other hand, when it is desired to conserve the soil-moisture, the roller may be followed by the harrow, which, by pulverizing the surface-soil, breaks the capillarity. Of the variations on the common smooth roller, the clod-crusher and the Cambridge roller are most generally used. The former combines weight with breaking power. The best-known form was patented about 1841 by Crosskill, and consists of a number of disks with serrated edges threaded loosely on an axle round which they revolve. The Cambridge roller carries on its axle a number of closely packed wheels, the rims of which narrow down to a wedge shape. The tubular roller, instead of drums, has tubes arranged longitudinally, producing a corrugated surface which is reproduced in the condition of the soil after it has been rolled.

ROLLER-SKATING, a pastime which, by the use of small wheels instead of a blade on the skate, has provided some of the pleasures of skating on ice without having ice as the surface (see SKATING). Wheeled skates were used on the roads of Holland as far back as the 13th century, but it was the invention of the four-wheeled skate, working on rubbersprings, by J. L. Plimp-ton of New York, in 1863, that made the amusement popular. Still greater advance was made by the Raymond skate with ball and cone bearings. The wheels or rollers were first of turned boxwood, but the fault of being too light were surmounted by making them of a hard composition or of steel. The floor of the rink on which the skating takes place is either of asphalt or of wood. The latter is that always used in newly made rinks. The best floors are of long narrow strips of maple. Figure-skating on roller-skates is in some respects easier to learn than on ice-skates, the four points of contact given by the wheels rendering easier the holding of an edge; but some figures, such as loops, are more difficult.

ROLLIN, CHARLES (1661–1741), French historian and educationist, was born at Paris on the 30th of January 1661. He was the son of a cutler, and at the age of twenty-two was made a master in the Collège du Plessis. In 1694 he was rector of the university of Paris, rendering great service among other things by revising the study of Greek. He held that post for two years instead of one, and in 1699 was appointed principal of the Collège de Beauvais. Rollin held Jansenist...
principles, and even went so far as to defend the miracles supposed to be worked at the tomb of François de Paris, commonly known as Deacon Paris. Unfortunately his religious opinions deprived him of his appointments and disqualified him for the rectorship, to which in 1710 he had been re-elected. It is said that the same reason prevented his election to the French Academy, though he was a member of the Academy of Inscriptions. Shortly before his death (14th December 1741) he protested publicly against the acceptance of the bull Unigenitus.

Rollin's literary work dates chiefly from the later years of his life, when he had been forbidden to teach. His once famous Ancient History (Paris, 1730-38), and the less generally read Roman History, which followed it, were avowed compilations, uncritical and somewhat inaccurate. But they instructed and interested generation after generation almost to the present day. A more original and really important work was his Traité des études (Paris, 1726-31). It contains a summary of what was even then a reformed and innovating system of education, including a more frequent and extensive use of the vulgar tongue, and discarded the medieval traditions that had lingered in France.

ROLLINAT, MAURICE (1853-1903), French poet, was born at Châteauroux in 1853. His father represented Indre in the National Assembly of 1848, and was a friend of George Sand, whose influence is very marked in young Rollinat's first volume, Dans les braves (1877). The volume, however, attracted little attention, and it was with his second publication, very different in manner, that he made his reputation. In Les Nérasses, with the sub-title Les Âmes,Les Luxures,Les Refuges,Les Spectres,Les Ténèbres,he showed himself as a disciple of Charles Baudelaire. He constantly returns in these poems to the physical horrors of death, and is obsessed by unpleasant images. Les outre in sentiment are L'Abîme (1886), La Nature, and a book of children's verse, Le Livre de la Nature (1893). He was musician as well as poet, and set many of his songs to music. He lost his reason in consequence of his wife's death from hydrophobia, and died on the 26th of October 1903.

ROLLING-MILL, a term which includes several types of machines used for producing the sectional forms (fig. 1) in which wrought iron and steel are required for the use of boiler-makers, platers and bridge-builders, and for constructing work generally. The production of wrought iron has been a diminishing industry for many years, while that of steel increases. Though the plant employed for both is alike in essential principles of design, the growth in the use of steel has revolutionized the practice, chiefly on account of the more massive dimensions in which steel sections are rolled. Iron sections are relatively small, and many are produced by piling, i.e. by building up with small portions of malleable puddled metal. There is no limit in reason to the dimensions in which steel sections can be rolled, and they are never piled, however large, but always rolled from solid cast ingots.

When steel ingots are rolled into sectional forms the reduction in transverse dimensions is very great. The work begins at nearly a white heat, and continues until a low red is reached. Obviously the stresses to which the material is subjected are very severe. For this reason the process of reduction has to be effected very gradually, and especially so in those cases where reduction is being done in two directions at right angles with each other, as in channel sections (fig. 6) and joist or beam sections (figs. 7 and 8).

It might be thought, since steel is always cast previously to rolling, that it might be cast at once into the sectional forms required. But sound results could not be obtained in this way, because the gases occluded in the metal form blow-holes which are sources of weakness. The material itself, even in the solid portions, is not homogeneous. By removing the head of the ingot where the blow-holes chiefly congregate and rolling the remainder at a white or red heat, the metal is improved by consolidation, and by the work done upon it. To this practice there is no exception.

Rolling-mills are known as “two-high,” or “three-high,” according as two or three rolls are mounted one over the other.

pass. An alternative is the three-high mill, in which three rolls are used. Here the plate is run through

the lower rolls and back through the upper ones, so that there is no reversal

direction of the mill as a whole, but the lower and upper rolls draw

the plates in opposite directions (see also IRON AND STEEL, § 129).

Plate-Mills.—In Great Britain plate-mills are generally two-high reversing mills, in America three-high mills. Another difference is that in British practice two stands of rolls are used, in America one only. In the two-stand design there are two sets of rolls coupled endwise, one set being grain-rolls for roughing, and the other chilled rolls for finishing. Sets of live rollers conduct the plates to and from the separate rolls. The plate-mills proper are those which roll from \( \frac{1}{4} \) in. to about 2 in. thick. Armour plate-mills are a special design for massive plates and sheet-mills for thin plates or sheets having a less thickness than \( \frac{1}{4} \) in. Armour plate-mills are of two-high reversing type usually, with forged steel rolls. They are of immense proportions, the rollers ranging from 10 to 14 ft. in length, by from 3 to 4 ft. in diameter. In sheet-mills, on the other hand, the rolls seldom exceed 30 in. in diameter, and they are chilled. The size of sheet-mills has within the last few years been considerably increased (since the introduction of steel sheets), and all new mills are made from 28 to 30 in. diameter. The mills are of the two-high type and are almost the only instance of the retention in present practice of the non-reversing mill. It is found more convenient in this case than the reversing or the three-high mills, because two men roll two pieces at once, one handing over a sheet just rolled to his fellow just as the latter has entered a sheet between the rolls on his side. Strip-mills are a smaller but similar type, used for rolling the thin narrow strips required for the hoops of barrels, ties for cotton bales, &c. The details of these mills cannot be discussed here, nor the numerous arguments in favour of the two systems. English practice retains the two-high reversing mill for all heavy work, the exceptions being those just noted. American practice retains the three-high mill.

Grooved Rolls.—In the mills designed for rolling various sectional forms the same distinction between two-high and three-high remains, but new problems arise. By "sectional forms" is meant all those which are not plates and sheets, such as bars of round and square section, angles, channels, rails and allied sections (fig. 1), for the production of which grooved rolls are required. The production of these grooves are such that reduction is effected very gradually. When metal is squeezed or hammered, one effect is to spread it laterally, so that a metal cannot be appreciably squeezed in on itself. But the lateral extension is very much less than

A, First roughing rolls. B, Second ditto. C, Guide rolls for ovals or diamonds. D, Ditto for rounds or squares. E, Driving pinions. Engine, 30 in. x 22 in. cylinder, direct-coupled to rolls. Runs from 100 to 180 revolutions per minute to suit work. The shears are used for cutting the smaller sections, the hot saw for cutting the merchant iron.

The guide rolls D are used for small sections, and the second set B for merchant iron (larger sections).
the longitudinal. The most marked effect of reduction in thickness is extension in length. But as there is some lateral extension, three courses are open; one is to gauge the exact amount of width required for extension; another is to turn a bar over at intervals in order to exercise pressure on the portions extended laterally and obliterate them (open passes); and a third is to allow the extensions to take the form of fins to be cut off subsequently (closed passes). The first is generally impracticable. The second can be illustrated by diagrams representing roll sections.

The work of reduction is generally divided between three sets of rolls. The first are the cogging-, or blooming-rolls, as they are termed in America, in which ingots are reduced to blooms with dimensions suitable for rolling the various sections. In these an ingot of say 14 in. square may be reduced to a bloom of 6 in. square. The grooves form rectangular sections (box passes). The top roll being raised, the ingot is passed through the largest groove; then the roll is lowered and it is passed through a second time. Then it is turned round and passed through 90° and recogged. Afterwards the same processes are gone through till the last groove is reached.

There is a great difference between, say, a plate and a rail, but the cogging-rolls have to be so designed as to produce blooms for varied forms. There are three principal forms of these grooves, provision is made in 'slabbing' rolls for roughing out, first in a box pass, and then in a broad flat groove, alternating with the square groove for correction of the edges. Gothic passes and diamond passes produce blooms which are subsequently used for various shapes having little resemblance to each other. These shapes are simple, and little difficulty arises in the work of drawing down. The rolls make 40 to 50 revolutions per minute; the difference in the area of the cross-section (draught) between adjacent grooves is from 20 to 25%.

The formative rolls for finished sections are of two classes: roughing and finishing. The roughing-rolls approximate much more closely to the finished sections than the cogging-rolls, but the aim is to make them do duty for a wide range of sections, in order to change them as seldom as possible. Thus the gothic pass (fig. 4) will serve alike for rolling square or round bars. Finishing rolls must be changed for every different section, except when slight differences in thicknesses only are made in the webbed portion of a rolled section. With the exception of rounds, sections are usually roughed and finished in closed passes—that is, the bar is wholly enclosed by the rolls. The groove in the lower roll is flanked by collars slightly deeper than the enclosed bar. These enter into grooves turned on the upper roll, and between them the bar is confined (fig. 5). It passes through a succession of these grooves, reduced in this way and offer no difficulty. The most unfavourable section is the joist or girder, the channels, tees and rails follow, and after these the various angles. In rolling a channel or a girder section (figs. 6, 7, 8), a square bloom is taken, and passed in succession through closed passes. The first produce shallow grooves in the opposite faces, gradually deepening until the inside of the flanges assume a definite slope. The angle of slope becomes gradually lessened, and the thicknesses of web and flanges, and also the radius at the corners, are reduced. At the same time the width over the flanges is being gradually increased. While this is going on, the fibres of the flanges are being strained, because the rolls run at a higher speed at their peripheries than next the body. The metal is being violently thrust and drawn in different ways, so that while economy has to be studied by reducing the number of passes as much as possible, undue stress must be avoided by making the reductions as easy as is practicable. These things cannot be put into a formula, but the roll-turners work by experience and empirical rules gathered by long practice. In order to avoid these deep groovings, and also severe lateral thrusts on the rolls, angle sections are always rolled with the slope of the flanges approximately equalized; so too are rods (fig. 1, No. 32). The reduction is then effected with the minimum of stress to the metal. Variations are readily made in the thicknesses of rolled sections without changing the rolls, by simply varying the distance between their centres. This is effected by the adjustment of the top roll (fig. 5). Differences in thickness are made in 1/16 of an inch, up to a maximum of about 1/8 in. Another detail of design in closed passes is so to shape the rolls as to make any pass obliterate the roll produced in the previous groove. Sometimes sections are turned over to effect this, but often the bodies of the rolls are turned of suitable diameters to produce the result. Guards are required to prevent the bars from becoming wrapped round the rolls ("collaring"). With the same object the upper roll is always made larger in diameter than the lower. Its speed is therefore slightly greater than that of the lower one. This stretches the plate or bar very slightly on the upper side, and so imparts a downward movement to it towards the floor, which is what is required. The difference in diameters varies with each class of iron.

Besides the standard types of mills noticed, the two-high and three-high, there are special mills. The merchant mill simply denotes either one of the above types used for the production of flat bars. The continuous mills are special designs for rolling small rods to be drawn into wire. In these there are several pairs of rolls placed in series, so that the billet is rolled from one stand to others in succession without re-heating. There are a number of different designs, one of which is the Belgian looping mill, so called because the rod is bent backward and forward in the form of the letter S in its passage through adjacent sets of rolls. In another design a flying shear is employed, which automatically cuts off billets from the bar while the latter is travelling at the rate of 6 or 8 ft. per second.

ROLLOCK, ROBERT (c. 1555-1590), the first principal of the university of Edinburgh, son of David Rollock of Powis, near Stirling, was born about 1555. He received his early education at the school of Stirling from Thomas Buchanan, a nephew of George Buchanan, and, after graduating at St Andrews, became a regent there in 1580. In 1583 he was
appointed by the Edinburgh town council sole regent of the "town's college" ("Academia Jacobii Sexti," afterwards the university of Edinburgh), and three years later he received from the same source the title of "principal, or first master," and was engaged in lecturing on philosophy. When the staff of the young college was increased by the appointment of additional regents, he assumed with consent of the presbytery the office of professor of theology. From 1587 he also preached regularly in the East Kirk every Sunday at 7 a.m., and in 1596 he accepted one of the eight ministerial charges of the city. He took a prominent part in the somewhat troubled church politics of the day, and distinguished himself by gentleness and tact, as well as ability. He was appointed on several occasions to committees of presbytery and assembly on pressing ecclesiastical business. He was elected moderator of the General Assembly held at Dundee in May 1597. In 1598 he was translated to the parish church of the Upper Tolbooth, Edinburgh, and immediately thereafter to that of the Grey Friars (then known as the Magdalen Church). He died at Edinburgh on the 8th of February 1600.

Rollock wrote Commentaries on the Epistles to the Ephesians (1658), Thessalonians (1658) and Hebrews (1665), the book of Daniel (1651), the Gospel of St John (1599) and some of the Psalms (1598); an analysis of the Epistle to the Romans (1594), and Galatians (1602); also Questions and Answers on the Covenant of Grace (1598); and a Treatise on Effectual Preaching (1598). His death eleven Sermons (Certaine Sermons upon Several Places of the Epistles of Paul, 1599) were published from notes taken by his students. His Select Works were edited by W. Gunn for the Wodrow Soc., Edinburgh, 1843-49.

A Life by George Robertson and Henry Charteris was reprinted by the Bannatyne Club in 1826. See also the introduction to the Select Works, and Sir Alexander Grant's History of the University of Edinburgh.

ROMA, a town of Waldegrave county, Queensland, Australia, 318 m. by rail W.N.W. of Brisbane. It is the centre of a rich pastoral and wheat-growing district, in which oranges and vines are largely grown and much wine is produced. The town was incorporated in 1867. Flour-milling is its chief industry. Pop. (1901) of town, 2371; of the district, 7140.

ROMAN, capital of the department of Roman, Rumania, on the main line from Cernowitz in Bukovina to Galatz, and on the left bank of the river Moldova, 24 m. W. of its junction with the Siret. Pop. (1900) 14,019, including 6699 Jews. The river is here spanned by a fine bridge of iron. Roman has been the seat of a bishop since 401. Its senatorial dates from 1402. There are several ancient churches, including a cathedral, built in 1541. Roman has a transit trade in the products of northern Moldavia. A large annual fair is held in August.

ROMAN ARMY. In the long life of the ancient Roman army, the most effective and long-lived military institution known to history, we may distinguish four principal stages. (1) In the earliest age of Rome the army was a national or citizen levy such as we find in the beginnings of all states. (2) This grew into the Republican army, which gradually subdued Italy and the Mediterranean world. A citizen army of infantry, varying in size with the needs of each year, it eventually developed into a mercenary force with long service and professional organization. This became (3) the Imperial army of defence, which developed from a strictly citizen army into one which represented the provinces as well as Italy, and was a garrison rather than a field army. Lastly, (4) the assaults of the Barbarian horsemen compelled both the creation of a field force distinct from the frontier garrisons and the inclusion of a large mounted element, which soon counted for much more than the infantry. The Roman army had been one of foot soldiers; in its latest phase it was marked by that predominance of the horseman which characterized the earlier centuries of the middle ages.

So far as we can follow this long development in its details, it has been throughout continuous. So unbroken, indeed, is the growth that many of the military technical terms survived in use from epoch to epoch, unchanged in form though deeply modified in meaning, and ordinary readers often miss the diversity which underlies this unchanged-seeming system. The term legion, for example, occurs in all the four stages above outlined. But in each its significance varies. Throughout, it denoted citizen-soldiers: throughout, it denoted also a force which was chiefly, if not wholly, heavy infantry. But the setting of these two constant features varies from age to age.

In the first period legio was the "levy," the whole host summoned to take the field. In the second period it was not the whole levy, but one of the principal units into which developing organization had divided that levy; the "legion" was now a body of some 5000 men—the number of "legions" varied with the circumstances, and the army included other troops besides citizens, though they were for the most part unimportant. In the third or Imperial age there were many legions (indeed, a fixed number) quartered in fixed fortresses; there were also other troops, numerous and important, if not so formidable as the legionaries. Finally, the legions became smaller units, and the other troops of the army, notably the cavalry, became the real fighting-line of Rome (see Legio).

First Stage.—The history of the earliest Roman army is, as one might expect, both ill-recorded and contaminated with much legend and legal fiction. We read of a primitive force of 300 riders and 3000 foot soldiers, in which the horseman counted for almost everything. But the numbers are clearly artificial and invented, while the pre-eminence accorded to the cavalry has no sequel in later Roman history. We reach firmer ground with the organization ascribed to Servius Tullius. In this system the host included all citizens from 17 to 60 years of age, those under 47 for service in the field, those over 46 for garrison duty in Rome. The soldiers were grouped at first by their wealth—that is, their ability to provide their own horses, armour, &c.—into cavalry (18 "centuries"?), heavy infantry, a remainder which it would be polite to call light infantry, and some artificers. The heavy infantry counted for most. Aman, with long, low, cloaks, ran with the braccae of hastati, principes and triarii (the origins and real senses of these names are lost), they formed a phalanx, and charged in a mass, while the cavalry protected the wings. The men were enrolled for a year—that is, for the summer campaign; in the autumn, like all primitive armies, they went home. It has been conjectured that about the time of the fall of the kings the normal Roman army comprised some 8500 infantry under 47 years of age, 5000 seniors, 1000 riders and 500 fabri, &c. The evidence for the calculation is unfortunately inadequate, but the result is not altogether improbable, and it may help the reader to realize what "may have been." It must be added that this Servian system is closely connected with the political organization (see Rome, History).

Second Stage.—From this Servian army a series of changes which we cannot trace in detail produced the Republican army. Our ancient authorities ascribe the chief reforms to the half-legendary Camillus (q.v.), who introduced the beginnings of pay and long service, improved the armour and weapons, abolished the phalanx and substituted for it an open order based on small subdivisions (maniples), each containing two centuries. Whatever the truth about Camillus, some such reforms must at some time have been carried through, to convert the Servian system into the army which was engaged for nearly three centuries (from 350 B.C.) in conquering Italy and the world. This army broke in succession the stout native soldiers of Italy and the mountaineers of Spain and overthrew the trained Macedonian phalanx. Once only did it fail—against Hannibal (see Punic Wars). But even Hannibal could not defeat them from entrenchments, and not even his victories could permanently break its moral. Much of its strength lay in the fact that, with many of the barbarian soldiers of Crassus terrible—the excellent character of the common soldiers, the rigid discipline, the high training. Credit, too, must be given to the genius of the Scipios and to the more commonplace capacities of many fairly able generals. But the organism
itself deserves attention, and, as it chances, we know much about it, mainly from Polybius. Its elements were three:—

(A) The principal unit was the legion, generally a division of 4500 men—5000 heavy infantry, 1000 lighter-armed (velites), 300 horse—though sometimes including as many as 6000 men. The heavy infantry were the backbone of the legion. They were levied from the whole body of Roman citizens who had some private means and who had not already served 16 campaigns, and in effect formed the main force of the army. The velites, who divided into 1200 Hastati, 1200 Principes and 600 Triarii, all had a large shield, metal helmet, leather cuirass, short Spanish thrusting and cutting sword, and in addition the hastati and principes each carried two short throwing spears (pila), while the triarii had three. The spears (see Arms and Armour). They were drawn up in three lines: (1) hastati, (2) principes, (3) triarii; the first two were divided into ten maniples each of 120 men, when the legion only counted 420, the second into 10 maniples of half the strength. According to the ordinary interpretation of our ancient authorities, the maniples were arranged in a chess-board fashion (quinquerma), the idea being that the front row of maniples could retire through the intervals in the second row without disorganizing, and the second row could similarly advance. Recent military writers, however, doubt whether this arrangement can be considered workable, and it is possible that our authorities mean by the word that has been already mentioned, any case the procedure in fighting seems to have been simple: the front line discharged a volley of pila and rushed in with the short sword—a sequence much like the volley and bayonet charge of the 18th century—and if at this point he did not divide his forces, the second line, which included the third line of triarii, armed with spear instead of pilum, was a reserve. The velites, armed with javelins, were either broken up among the heavy-armed centuries or used as skirmishers or as aids to the cavalry. The 300 cavalry, however, were usually supported by at least 120 auxiliary horsemen, and the natural result if, as we have reason to think, the horses were small and stirrups were not used. The officers of the legion consisted of: (a) Six tribunes, in part elected by the comitia, in part appointed by the consuls, and holding command in rotation. They were either veteran officers, sometimes even ex-magistrates, or young noblemen beginning their career. (b) Sixty centurions, each commanding one century, or, rather, a pair commanding each maniple. They were chosen by the tribunes from among the veteran soldiers serving at the time and were arranged in a complicated hierarchy, by means of which a centurion might move upwards till he became primus pilus, senior centurion of the first maniple of triarii, the chief officer in the legion. (c) There were standard-bearers and other under-officers, to whom reference must be made to specialist publications.

(B) Besides the legions, composed of citizens, the Roman army included contingents from the Italian allies (socii). Subjects of Roman citizenship, or Romanized alien, or resident in Italy, were represented by these allies. We find as many socii as legionaries, but we are ignorant of details. The men were armed and drilled like the legionaries, but they served not in legions but in cohorts, smaller units of 400–500 men, and their conventional positions seem to have been on the wings of the legions. They were principally infantry, but included also a fairly large proportion of cavalry. Despite their numbers, they do not appear to have ranked with the heavy legionary infantry, and the same period records more as detachments from the allied army than as infantry of the line.

(C) Besides legionsaries and socii, the Roman army included non-Italian troops of special kinds, Balearic slingers, Numidian horsemen, or sometimes auxiliary Greek contingents, etc. As an example (217 B.C.), the Roman army included 600 Cretan archers. The numbers of these auxilia varied; probably they were not numerous till the latest days of the Republic.

Charles W. Eliot, in "Organic Changes in the State of Armies in the Second Stage."—According to the general practice, each of the two consuls, if he took the field alone, commanded an army of two legions with appropriate socii. If the two consuls combined their forces, commanding the joint force in concert. (As we see in later times, the total would be reckoned by us as two legions, that is 4800; but the name of "allies" is misleading in implying that the auxilia were the equals of the legionaries.) The total number of men in the field could be increased; we even hear of 23 legions serving at one time in the Second Punic War.

Just before this war, in 225 B.C., the total strength of Rome was reckoned at three-quarters of a million, of which about 65,000 were in the field and 55,000 were in a reserve at Rome; of the total, 325,000 were Roman citizens and 443,000 (apparently a rough estimate) were auxilia and allies. These numbers show how the chances of success were simple. In the centre stood the legionary infantry: on each side of that was the allied infantry: on the wings the cavalry. But sometimes the legions were held in reserve and the brunt (and honour) of the fight was left to the allies. Sometimes, when the auxilia were not enough, they were divided into two parts and others lay in reserve. Frequently the attack was begun by one wing, as by Caesar at Pharsalus. At Ilipa in Spain Scipio put his Spanish auxiliaries in the centre, his Roman troops on the wings, and his cavalry almost off the field and with both wings. The chief command of the army fell (as stated above) to the consul, if present, or, if two consuls acted together, to them in turn. In default of consuls, a pro-consul, praetor, or prætextator, in charge of a province, would command.

Development from the Second Stage to the Third.—Towards the end of the Republic many changes began to work themselves out in the Roman army. If Camillus began the system of pay and long service, it was effectually developed by long foreign wars in Spain and in the East. Moreover, the growth of Rome as a wealthy state tended to wreck the old theory that every citizen was a soldier, and favoured a division of labour between (e.g.) the merchant and the military, while the increasing complexity of war required a longer training and a more professional soldier. In consequence, the old restriction of legionary service to men with some sort of private property was abolished by Marius about 104 B.C. and the legionaries now became wholly proletariate and professionals. By a second change, also connected with the name of Marius, the legion was reorganized as a body of 5000 men in 6 centuries, divided into 10 cohorts instead of (as hitherto) into 30 maniples; the unit of tactical action thus became a body of 600 instead of 120. This was probably an adaptation within the legion of the system of cohorts already in use for the contingents of the socii. Soon after, the extension of the Roman franchise to all Italians converted allies and subjects into citizens, and the socii into legionaries. A fourth change abolished the legionary cavalry and greatly increased the auxilia (C above). And, finally, the appearance of great military leaders in place of civilian statesmen, and of pretenders to a throne in place of patriots, familiarized the world with the notion of large standing armies commanded by permanent chiefs, and at the same time destroyed discipline and military loyalty.

Third Stage.—The Imperial Army of Defence.—The evils of the Civil Wars (49–31 B.C.) furnished the first emperor, Augustus, with both the opportunity and the necessity for reforming the army. Disorganization had reigned for twenty years. It was needful to restore loyalty and system alike. Augustus did this, as he did all his work, by adapting the past: yet there is some truth in the view of his latest historian, von Dossenewski, that his army reforms were his greatest and most original work. The main line of his work is simple. The Imperial army was composed of two forces, regulars and auxiliaries, the two being about equal in numbers if unequal in importance. The first grade were the legionaries, recruited from Roman citizens, whether resident in Italy or in the provinces. The second grade was formed by the auxilia, recruited from the subjects (not the citizens) of the Empire in the provinces, organized in cohorts and alae and corresponding somewhat to both the socii and the auxilia of the Republic. There were also in Rome special "household" troops (see Praetorians); and a large body of vigiles who were both fire brigade and police.

(A) The legion of the Empire was what Marius had left it—6000 heavy infantry divided into 10 cohorts: Augustus added 5000 light infantry and 1000 husars. The legions were thus doubled, or at least increased in size. The supreme command was no longer in the hands of the six tribunes. According to a practice which had sprung up in the latest Republic it was in the hands of a legatus legioni, deputy of the general (now of the emperor, commander-in-chief of the whole army) and a man usually of senatorial rank and position. The six tribunes assisted him, in theory: in practice they were now little more than young men of good birth learning their business or wasting their
time. The real officers of the legion were the 60 centurions, men who (at least in the early Empire) generally served up from the ranks, and who knew their work. The senior centurion, primus pilus, was an especially important officer, and on retirement frequently became prefectus castrorum, "camp adjutant," or deputy to the legate, or even, in the later 1st century BCE, legate of a whole province. Below the centurions were under-officers, standard-bearers, optio, clerks and the like. The men themselves were recruited from the body of Roman citizens (though we may believe that the 1st century legions were not all made up of "true" citizens). The legions that supplied most of the men for the legion (if any) stationed in it, and so many sons of soldiers born during service (castrenses) flocked to the army that a military caste almost grew up. The term of service was, in full, twenty years, at least in theory, but recruiting was voluntary and many who had been short discharged were often willing to receive discharge the ex-legionary received a bounty or land: many coloniae (municipalities) were established in the provinces by certain emperors for the special purpose of taking discharged veterans—often called "coloniae militariae," and in due Roman Republican age. On the whole, the legionary was still the typical "Roman" soldier. If he was no longer Italian, he was generally of citizen birth and always of citizen rank, and his connection with the Empire and the government was that he bore a title and number (e.g. II. Augusta, III. Gallica). The customs of using such titles and numbers can be detected sporadically in the latter Republic, and many titles and numbers then borne by legions passed into law. That with the passage of years, and his own gradual mastery of the world, he found himself with three armies, his own and those of Lepidus and Antony; from the three he chose certain legions to form his new standing army, and he left them with the number and titles which they already bore. It is probable that he did retire a number of them so as to provide an army, although that concession resulted in three legions numbered III., and two numbered IV., V., VI. and X. respectively. Similar titles and numbers were given to legions raised afterwards either to fill a gap caused by disaster or to increase the army. Here, as elsewhere in the Roman and above all in the Augustan system, precedent defied logic. (B) Besides the legions Augustus ended the era of large field armies; he could, indeed, leave no such weapons for future pretenders to the throne. By keeping the Empire within set frontiers, he developed the counter tendency. That policy exactly suited the military position in his time. The early Roman Empire had not to face—as Britain or France or Germany might have to face to-day—the danger of a war with an equal enemy, needing the mobilization of all its national forces. From Augustus till a.d. 250 Rome had no conterminous foe from whom to fear invasion. Parthia, her one and dangerous equal, was far away in the East and little able to strike home. Elsewhere, her frontiers bordered more or less wild barbarians, who might often harass, but could not do serious harm. To meet this there was need, not of a strong army concentrated in one or two cantonments, but of many small garrisons scattered along each frontier, with a few stronger fortresses to act as military centres adjacent to these garrisons. Accordingly, a system grew up under Augustus and his immediate successors whereby the whole army was distributed along the frontiers or in specially disorderly districts (such as N.W. Spain) in permanent garrisons. On the actual frontiers and on the chief roads leading to them were numerous cohorts and alae of auxiliaries, garrisoning each its own castellum of 3-7 acres in extent. Close behind the frontiers, or even on them, were the twenty-five legions, each (with a few exceptions of early date) holding its own fortress (castra stativa or haberna) of 50-60 acres. Details varied at different times. Sometimes, where no Rhine or Danube helped, and where outside enemies were many, the frontier was further fortified by a continuous wall of wooden palisades (as in part of Germany, see Limes) or of earth or stone (as in Britain, see article BRITAIN, ROMAN), or the boundary might be guarded by a road patrolled from forts planted along it (as in part of Roman Africa). The result was a long frontier guard covering Britain, and Europe from the German Ocean to the Black Sea, and the upper Euphrates valley, and the edge of the Sahara south of Tunis and Algeria and Morocco, while the wide Empire behind it was little troubled by the presence of soldiers. The following table shows the disposition of the legions about a.d. 120 and for many decades subsequently. It would be impossible, even if space allowed, to add the auxiliaries, since the details of their distribution are too little known. But it may be in general assumed that the total number of auxiliaries in any province was little less, and probably rather greater, than the number of legionaries, and the sizes of the various provincial armies can thus be calculated roughly. Thus Britain was held probably by 35,000-40,000 men. Each provincial army was commanded either by the governor of the province (or in a few exceptional cases) by the senior leitus of the legions stationed there:—

Composition of Armies and Division of Troops in the Third Stage.—If the system of legions and auxilia in the early Empire was novel, the use made of them was no less so. The latest Republic offers to the student the spectacle of large field armies, and though it also reveals a counter tendency to assign special legions to special provinces, that tendency is very feeble.
The total of legionaries may be put at about 180,000 men, the auxiliaries at about 200,000. If we exclude the “household” troops at Rome, the police fleets on the Mediterranean, and the local militia in some districts, we may put the regular army of the Empire at about 400,000 men. This army, as will be plain, was framed on much the same ideas as the British army of the 19th century. It was meant not to fight against a first-class foreign power, but to keep the peace and guard the frontiers of dominions threatened by scattered barbarian raids and risings. Field army there was none, nor any need. If special danger threatened or some special area was to be conquered—such as southern Britain (a.d. 43) or a little land across the upper Rhine (a.d. 74)—detachments (peregrinarii) were sent by legions and sometimes also by auxiliaries in adjacent provinces, and a field force was formed sufficient for the moment and the work.

Change from the Third Period to the Fourth.—Two principal causes brought gradual change to the Augustan army. In the first place, the pax Romana brought such prosperity to many districts that they ceased to provide sufficient recruits. The Romans, like the British in India, had more and more to look to uncivilized regions and even beyond their borders. Hence comes, in the 2nd century and after, a new class of numeri or cunei or vexillationes who used (like the earlier auxiliaries) their national arms and tactics and imported into the army a more and more non-Roman element. This tendency became very marked in the 3rd century and bore serious fruit at its close. And, secondly, the old days of mere frontier defence were over. The barbarians began to beat on the walls of the Empire as early as a.d. 160: about a.d. 230 they here and there got through, and they came henceforward in ever-growing numbers. Moreover, they came on horseback, bringing new tactics for the Roman infantry to face, and they came in huge masses. We may doubt whether the Roman system could have permanently stayed this astonishing torrent. But the Empire did what it could. It enlisted barbarians to fight barbarians, and added freely—to freely, perhaps, if there was any choice—to the non-Roman elements of the army. It increased its cavalry and began to form a distinct field force.

Fourth Period.—The results are seen in the reforms of Dio- cletian and Constantine the Great (a.d. 284–circa 320). New frontier guards, styled limitanei or riparienses, were established, and the old army was reorganized in field forces which accompanied or might accompany the emperors in war (comitatenses, palatini). The importance of the legions dwindled; the chief soldiers were the mercenaries, mostly Germans, enlisted from among the barbarians. New titles now appear, and it becomes plain even to the casual reader that in many points the new order is not the old. The details of the system are as complicated as all the administrative machinery of that age. Here it is enough to point out that the significance of such officers and titles as the dux and the comes (duke, count) lies ahead in the history of the middle ages, and not in the past, the history of the Roman military system.

War Office, General Staff.—Under the Republic we do not find, and indeed should not expect to find, any central body which was especially entrusted with the development of the army system or military finance or military policy in wars. Even under the Empire, however, there was no such organization. The emperor, as commander-in-chief, and his more or less unofficial advisers doubtless decided questions of policy. But the army was so much a group of provincial armies that much was left to the chief officers in each province. Here, as elsewhere in the Empire, we trace a love if not for Home Rule at least for Devolution. There was, however, a central finance office in Rome for the special purpose of meeting the bounties (or equivalent) due to discharged soldiers. This was established by Augustus in a.d. 6 with the title aerarium militare, and had, for receipts, the yield of two taxes, a 5% legacy duty and a 1% on sales (or perhaps only on auction sales). The legacy duty did not touch legacies to near relations or legacies of small amount.

ROMAN ART. (1) Introductory: History of Recent Research.
—The scientific study of ancient Roman art dates from a comparatively recent period. The great artists of the Renaissance, headed by Raphael and Michelangelo, showed no lack of appreciation for such models as the bas-reliefs of Trajan’s Column; and it is sufficient to name Mantegna’s “Triumph of Caesar.” In order to recall the influence exerted by Roman historical sculpture upon their choice and treatment of monumental subjects; but their eyes were fixed on the Greek ideal, however imperfectly represented by monuments then accessible, and the supremacy of this standard became established beyond challenge. In the 18th century Winckelmann, the founder of the science of classical archaeology, directed the gaze of students and critics towards the glories of classical Greek art, which he divined behind the copies which filled the palaces and museums of modern Rome; and the rediscovery of the extant remains of that art, which began early in the 19th century and still continues, has naturally absorbed the attention of the great majority of classical archaeologists. Nevertheless, towards the close of the 19th century, when the main lines of Greece’s artistic development had been firmly traced and interest was aroused in its later offshoots, critics were led to examine more closely the products of the Roman period. As early as 1874 Philippo had published a study of Roman triumphal reliefs; but his intention was to show that they were derived from the paintings exhibited on the occasion of a triumph—a theory which can no longer be maintained—and not to determine their place in the history of art. In 1893, however, Alois Riegl published a series of essays on the history of ornament under the title of Stilfragen, in one of which he expressed the opinion that “there was in the antique art of the Roman Empire a development along the ascending line and not merely a decadence, as is universally believed.” This thesis was taken up two years later by Franz Wickhoff in a preface contributed to the reproduction in facsimile of the illustrated MS. of Genesis in the imperial library at Vienna. Wickhoff contended that, whilst the art of the Augustan period was the culmination of that which had flourished under the Hellenistic monarchies, it was succeeded by an outburst of genuinely Roman artistic efflorescence, which reached the height of its development in the art of the Flavian period, and gave birth in the 2nd century a.d. to the monuments of the “continuous” style of representation exemplified by the imperial columns. Wickhoff’s work has become familiar to English readers through Mrs Strong’s

1 The elephant book of Winckelmann’s Geschichte der Kunst, which deals with art under the Romans, contains notable proofs of the author’s sureness of vision; for example, he divined the true date and affinities of the reliefs in the Villa Borghese, afterwards wrongly attributed to the time of Claudius (see below).

excellent translation, with copious illustrations, which appeared in 1900; in the following year Riegl published the first (which, despite his untimely death, remains the only) volume of his Late Roman Industrial Art in Austria and Hungary, in the opening chapters of which he endeavour to show that the later transformations of Roman art in the 2nd and succeeding centuries after Christ continue to mark a definite advance. On the other hand, the originality of Roman art under the Empire was called in question by Josef Strzygowski, whose first important work on the subject, Orient oder Rom, appeared in 1901. Strzygowski holds that even in the imperial period, Rome was receptive rather than creative; that what is termed “Roman imperial art” is in reality the latest phase of Hellenistic art, whose chief centres are to be sought in Asia Minor, Syria and Egypt; and that this late Hellenistic art was itself gradually transformed by the invading spirit of the East into that Byzantine art which is half Greek and half Oriental, but wholly un-Roman. The problem thus stated will presently be discussed; in the meantime it is to be noted that the principal monuments which fall within our province have been at length rendered accessible to students by a series of adequate reproductions. In sculpture, the reliefs of Trajan’s Column have been published by Cichorius, and those of the column of Marcus Aurelius by Petersen and others; in metalwork, the treasure of Bosco Reale has been reproduced in the Monuments Pioł, and that of Hildesheim has been published by the authorities of the Berlin Museum; a series of reproductions, including all the important examples of Roman painting, is issued by the firm of Bruckmann under the supervision of Paul Herrmann; and the ancient paintings preserved in the Vatican library, which include some of the most famous examples of the art, were published and described by Dr Nogara in 1907. The discussion of the date to be assigned to the Trophy of Trajan at Adam-Kliis in the Dobrudja, initiated by Adolf Furtwängler, has led to a closer study of the relations of the Etruscan art of the 3rd century B.C. to the foundation of the Ara Pacis Augustae at Rome, together with additional remains of its sculptured decoration, has given an impulsion to the study of Roman historical monuments. In this field important contributions to knowledge have been made by members of the British school at Rome, which will be noticed below. Finally, the history of Roman sculpture has for the first time been systematically and comprehensively treated by Mrs Strong in a handbook whose copious and well-chosen illustrations add greatly to its value. Thus the necessary equipment has been furnished for students of the problem presented by Roman art.

2 National Roman Art; Landmarks of its History.—It is impossible to speak of a specifically Roman national art until we approach the latest period of Republican history. The germs of artistic endowment which existed in the Roman character were not developed until her political institutions were formed and her supremacy in the Mediterranean established. Up to that time such works of art as were produced in, or imported into, Rome were without exception Greek or Etruscan. Both in Etruria and in Latium Greek artists were commissioned to decorate the temples in which wood and terra-cotta took the place of the marble which Greece alone could afford to use. In 406 B.C., according to tradition, two Greek artists, Damphilos and Gorgasos, decorated the temple of Ceres, Liber and Libera with paintings and sculpture; when the temple was restored by Augustus their terra-cotta reliefs were carefully removed and framed.1 But most of the early sculpture preserved in Rome doubtless belonged to the “Tuscan” school, whose works Pliny2 quotes as evidence that there was an art of statuary native to Italy. It is true that Etruscan art was dependent for its motives and technique on Greek models; but this was partly — notably in the reclining figures which adorn Etruscan sarcophagi—we can trace the uncompromising realism and close attention to detail which are native to Italian soil; the fragments of temple-sculptures which have been preserved are of less value, since, if not the work of Greeks, they are entirely Greek in conception. Roman portraiture undoubtedly continues the Etruscan tradition. It was a common custom in Etruria to decorate the urn containing the ashes of the dead with a lid in the form of the human head (such urns are called canopi), and the same desire to record the features of the departed produced the waxen masks, or imagines, which were preserved in the houses of the Roman aristocracy. In architecture, too, Roman builders learnt much from their Etruscan neighbours, from whom they borrowed the characteristic form of their temples, and perhaps also the prominent use of the arch and vault. But the stream of Etruscan influence was met by a counter-current from the south, where the Greek colonies in Campania provided a natural channel by which Hellenic ideas reached the Latin race; and Roman architects soon abandoned the purely Etruscan type of temple for one which closely followed western Greek models. The conquests of the later Republic, however, brought them into more direct contact with the art of Greece proper. Beginning from 212 B.C., when Marcellus despoiled Syracuse of its principal statues, every victorious general adorned his triumph with masterpieces of Greek art, whether of sculpture or of painting, and, when Philhellenism became the ruling fashion at Rome, wealthy connoisseurs formed private collections drawn from the Greek provinces—Greek craftsmen, moreover, were employed in the decoration of the palaces of the Roman nobles and capitalists, which scarcely differed from those of the great Hellenistic cities. Except in portraiture, there was nothing characteristically Roman in the art which flourished in Rome in the time of Caesar and Cicero. But the remains of an altar, preserved partly at Munich and partly in the Louvre (Plate II. fig. 10), which is believed with good reason to have been set up by Cn. Domitius Ahenobarbus shortly before 30 B.C., furnish an exactly example of the historical, or, to speak more exactly, commemorative art, to whose development the Romans gave so powerful an impulse. On the one face of the altar we find a Greek subject—the marriage of Poseidon and Amphitrite,—on the other a Roman sacrifice, the suovetaurilia, with other scenes from the life of the army. Augustus enlisted art, as he did literature, in the service of the new order. The remarkable technical dexterity which characterizes all forms of art in this period—silver plate and stucco decoration, as well as sculpture in the round or in relief—is purely Greek; but the form is filled with a new content. For Augustus determined to enlist art as well as literature in the service of the new régime, and this purpose was served not only by public monuments, such as the Ara Pacis Augustae (Plate II. figs. 11-13), but by the masterpieces of the silversmith’s and gem-engraver’s art (Plate VII. figs. 32-37). In the art, as in the literature of the Augustan age, classicism was the dominant note, and the naturalism so common to the Italian temperament was repressed, though never extinguished. The result of this was that under the Julio-Claudian dynasty academic tradition filled the place of inspiration, and Roman art failed to discover its vocation. A change came under the Flavian emperors. The painters who decorated with fairy landscapes the walls of Roman palaces, unhampered by the conventions of official art, introduced into Rome a summary method of working, which has much in common with that of the modern impressionist school; and the sculptors of the Flavian period laid to heart the lesson taught by their successful “illusionism” (to borrow Wickhoff’s term). We shall see that this is true of all forms of sculpture—historical sculpture, portraiture and decorative ornament; and we are entitled to rank this Flavian art as the specific creation of imperial Rome, whatever may have been the precise nationality of the individual workers who adorned the new capital of the world. Nor shall we be altogether wrong in saying that this phase was of short duration; and the Roman spirit, which in harmony with that of Greece had produced such brilliant results, triumphed under Trajan and found its characteristic expression in the “epic in stone” with which his column is adorned. Wickhoff claims the “continuous"
style in which the artist recounts the Dacian campaigns of Trajan as a creation of the Roman genius. We shall see that the term is not altogether a happy one; but there is good reason (as will be shown below) for the belief that the designer of the column, however profoundly influenced in his selection of motives and in his composition of individual scenes by Greek tradition, nevertheless worked out his main principles for himself. The realism of the Roman is shown in the minute rendering of details, which makes the reliefs a priceless source of information as to military antiquities. Historical art achieved no less a triumph in the great frieze from Trajan’s Forum (Plate II. fig. 16), and in the panels of the arch at Benevento. Imposing as these works are, they suffer from the defects incidental to an art which endeavours to express too much. Overcharged with detail, and packed with meanings which reveal themselves only to patient study, they lack the spacious and reposeful character of Greek art; while, if we regard only their decorative function, we must admit that the excess of ornamental surface mars the effect of the buildings which they adorn. Along the path thus marked out, Roman art continued to progress; it is true that under the influence of Hadrian there was a brief renaisance of classicism which gave birth to the idealized type of Antonius, and to certain eclectic works which belong to Greek rather than to Roman art; the historic reliefs which survive from the Antonine period, and more especially the sarcophagi, which reproduce scenes of Greek mythology with a close adherence to the letter but a fresh artistic spirit, show that the new leaven was at work. The main fact underlying the changes of the time was the loss of the true principles of plastic art, which even in Hellenistic times had become obscured by the introduction of pictorial methods into relief-sculpture. Colour, rather than form, now took the highest place in the gamut of artistic values. Painting, indeed, so far as our scanty knowledge goes, was not practised with conspicuous success; but the art of mosaic was carried to an extraordinary degree of technical perfection; and in strictly plastic art the choice of material was often determined by qualities of colour and transparency. For example, porphyry, basalt and alabaster of various hues were used by the sculptor in preference to white marble; and new conventions, such as the plastic rendering of the iris and pupil of the eye, were dictated by the ever-growing need for contrasts of light and shadow. This great revolution in taste has been traced, and doubtless with justice, to the permeation of the Graeco-Roman world by the influence of the Hellenistic art of the East. The Hellenistic school has always preferred colour to form, and richness of ornament to significance of subject; and in art, as in religion, the West was now content to borrow. Roman official art, however, continued to produce the historical monuments which the achievements of the time demanded; but the principles of figure-composition were less fully grasped. The reliefs of the Aurelian Column form a less intelligible series than those of the Column of Trajan; and the panels of the Arch of Septimius Severus, with their bird’s-eye perspective, have not inaptly been compared to Flemish tapestries. The extravagance and pomp of the dynasties founded by Septimius Severus filled Rome with such works as the art of the time could produce; and the busts of Caracalla show that in portraiture Roman craftsmen retained their cunning. Even during the anarchy which followed masterpieces such as the portrait of Philip the Arab were produced; and during the reign of Gallienus (A.D. 253–268), which saw the dismemberment of the Empire, there was a noteworthy outburst of artistic activity, whose products are seen in the naturalistic portraits of the emperor and the court. But by the close of the 3rd century a further transformation had taken place, and coincided with the political revolution by which the absolute monarch of Diocletian succeeded to the principate of Augustus. The portraits of Constantine and his house can no longer be termed naturalistic; they are monumental, both in scale and in conception, and, above all, their rigid “frontality” carries us back at a bound to the primitive art of the East. The classical standard set by the Greek genius had ceased to govern art, although the fund of types which Hellenism had created still furnished subjects to the artist, or was made the vehicle by which the new ideas derived from Christianity were expressed. The Roman spirit was still strong enough to maintain that interest in the human form and the representation of dramatic events which was lacking in the Oriental; but in the monuments of the Constantinian period, such as the narrow friezes of the Arch of Constantine, we can see nothing but the work of artists who had lost touch with true plastic principles, in spite of the ingenious arguments adduced by Riegl. If we are to seek for signs of progress, it must be rather in the domain of architecture, which had never ceased to make advances in dealing with the spatial and constructive problems presented by the great building works of the Empire; it was now called upon to face a fresh task in providing Christians with a fit place for public worship.

In the solution of this problem the architects of the 4th century showed a wonderful fertility of resource; but to describe their achievements would be to pass the confines of Roman art in the proper sense of the word.

ART (1902) Architecture.—This branch of the subject may be studied in the article Architecture, and illustrations will be found in other articles (Capital, Column; Orders; Triumphal Arch; &c.). Architecture, regarded as a fine art, had been brought by the Greeks to the highest perfection of which it was capable under the limitations which they imposed upon themselves. The Greek temple appeals to the aesthetic sense by the simplicity and harmony of its proportions as well as by the rational correspondence between function and decoration in its several members. On these lines there was no room for progress. It is true that the Etruscans modified the type of the Greek temple and profoundly influenced Roman construction in this respect. The Etruscan temple was not approached on all sides by a low flight of steps, but raised on a high platform (podium) with a staircase in the front; it was broad in proportion to its depth, indeed, in many cases, square; and the temple itself (cella) was faced by a deep portico, which often occupied half the platform. Moreover, as the use of marble for building was unknown in early Italy, wood was employed in construction and terra-cotta in decoration, and this change of material led to a wider spacing of the columns than was possible in Greece. But these alterations in the system of proportions were disadvantageous to aesthetic effect; and the Romans—though they soon ceased (under the influence of the western Greeks) to build temples of purely “Tuscan” type—preserved certain of their features, such as the high platform and deep portico (see Architecture, fig. 26). Nor can we regard as felicitous the design of certain Roman temples, such as that of Concord overlooking the Forum, and the supposed temple of Augustus (see Rome), which have a broad front (approached in the temple of Concord by a central portico) and narrow sides. The great temples of the Empire were (in general) inspired by Greek models, and need not therefore concern us; but we may notice Hadrian’s peculiar design for the double temple of Venus and Rome, with twin cellae placed back to back. To the orders (see Order) of Greek architecture the Etruscans added the “Tuscan,” a simplified Doric, of which an early example has been found at Pompeii, enclosed within the wall of the Casa del Fauno. This column, which can scarcely be later than the 6th century B.C., has a smooth shaft with pronounced entasis, a heavy capital with a scotia between abacus and column, and a plain circular base. To the Romans we owe the “Composite” order, so called because it contains features distinctive of the Corinthian and Ionic orders (see Orders, fig. 14). It is really a variety of the Corinthian, with Ionic volutes inserted in the capital; the earliest known example of its use is seen in the Arch of Titus. The Romans, moreover, made frequent use of the figured capital, which, as

1 It is very remarkable that the coin-portraits of the Gallic usurper Postumus (A.D. 258–268) are executed in precisely the same style; the coins were struck either at Trier or at Cologne.

the remains of Pompeii show, was an invention of the later Hellenistic age. Reduced copies of statues are found in the decoration of such capitals in the baths of Caracalla; the capitals with Victories and trophies in S. Lorenzo Fuori also belonged to a building of pagan times.

But the specific achievement of the Roman architect was the artistic application of a new set of principles—which those are expressed in the arch, the vault and the dome. The rectilinear buildings of the Greeks, with their direct vertical supports, gave place to vaulted structures in which lateral thrust was called into play. The aesthetic effect of the curves thus brought into prominence was well understood by the Romans; and they were the inventors of the decorative combination of the Greek orders with the arcade. More than this, the erection of vaults and domes of wide span, rendered possible by the use of concrete, gave to the Roman architect the opportunity of dealing artistically with internal spaces. A simple yet grandiose example of this may be found in the Pantheon of Hadrian. Circular buildings were a common feature in Italian architecture, the temple of Vesta, which doubtless represented the primitive hut or dwelling of the king, always had this form, and the theme was repeated with many variations, from the well-known circular temple in the Forum Boarium to the fantastic structure with broken outlines at Baalbek. But in the Pantheon the artist lays stress, not on the exterior, which possesses no special effect, but on the interior, whose proportions are carefully determined and give a most impressive result. The same may be said of the great halls of the Imperial Thermae, and as time went on more elaborate architectural schemes were devised to meet the requirements of the Christian Church.

(b) Sculpture.—It was pointed out above that in the late Republican period specifically Roman art was practically confined to portraiture. Of this we have many fine examples, such as the so-called Domitius Ahenobarbus of the Braccio Nuovo (Plate II. fig. 9), and there is a series of busts which possess a special interest in that some of them have been claimed as portraits of Scipio Africanus. The example in the Museo Capitolino (Plate I. fig. 2), with a modern inscription, though executed in the 2nd century A.D., is clearly copied from a famous Roman original. The baldness of the head has been thought to be derived from the technique of the waxen imagines, in which the hair was painted; the presence of a scar above the temple, which has given rise to various theories, merely betokens the unsparing realism of the Republican artist. In monumental sculpture our earliest datable example is the altar of Domitius Ahenobarbus, already referred to (Plate II. fig. 10). The ceremonial scene of the sventasuriti fills the centre of the composition; to the left we see the dismissal of veterans for whom diplomas are being prepared; to the right the troops on active service, both horse and foot, are represented. The work was inspired by statuary and other types of earlier date, which are grouped in a somewhat loose composition. Augustan art is adequately represented by the Prima Porta statue of the emperor, discovered in 1863 in the Villa of Livia and now in the Braccio Nuovo (Plate III. fig. 17). The attitude of the figure is that of an emperor addressing his army; but there is a characteristic blending of the real with the ideal, for the emperor is not only bareheaded but barefoot, and beside him is a tiny cupid riding on a dolphin, which indicates the descent of the Julian house from Venus. We note, too, how the Roman artist—or the Greek artist interpreting the wishes of the Roman—is scarcely more concerned for the total effect of his work than for the significant details of the decoration. The chasings of the corselet display, as a central subject, the restoration by the Parthian in 20 B.C. of the standards taken from Crassus at Carrhae (53 B.C.). Not content with this, the artist has added a group of personifications indicating sunrise—Sol, Caelus, Aurora and the goddess of the morning—hw as well as Apollo, Diana, Mars and the earth goddess, and two figures symbolic of the western provinces, Gaul and Spain. It is also to be noted that the statue shows abundant traces of its original polychrome tints—brown, yellow, blue, red and pink. It must have been executed later—probably not much later—than 13 B.C., when Augustus returned from the West, and therefore belongs to the same period as the Ara Pacis Augustae, dedicated January 30, 9 B.C. This altar stood in a walled enclosure with two entrances, measuring 11½ by 10½ metres. The walls, with their plinth, were about 6 metres in height, and were decorated internally with a frieze of garlands and bucrania, and externally with two bands of relief, the lower consisting of conventional scrolls of acanthus varied with other floral motives, and teeming with bird and insect life, the upper showing processions (Plate II. fig. 11) passing from east to west. The most interesting of these is that on the south wall, which included Augustus himself, the flamines and the imperial family.² On the western face, towards which the processions are directed, we find a scene of sacrifice, with a landscape background, in which the ideal figures of senate and people appear. To the east front (apparently) belongs the beautiful group of the earth goddess (Tellus) and the spirits of air and water (Plate II. fig. 13). It is impossible to deny the incongruity of this composition with the realistic procession which adjoins it, and we can only suppose that the artist borrowed the group from some Hellenistic precursor and used it in that blend of the real and ideal which, as we saw, was the keynote of the new imperial art.

The lack of public monuments which can be assigned to the Julio-Claudian period is only in part supplied by those of private significance; the most important of these are the sepulchral cippi and other altars, decorated sometimes with figure-subjects, but largely with plant and animal forms rendered with the utmost naturalism. The altar with plane-leaves in the Museo delle Terme (fig. 38), though perhaps not later than Augustus, is typical of the spirit in which vegetable forms were treated under the first dynasty. We may take a female portrait discovered in a 1st-century house on the right bank of the Tiber (Plate I. fig. 3) as an example of the portraiture of this period, which shows great technical merit but a touch of conventionality.

The sculpture of the Flavian period finds its best-known example in the reliefs of the Arch of Titus. This has but a single archway; the piers had no sculptured decoration, and the narrow frieze which surmounts the architrave is perfor-
though we cannot subscribe to his view that the artist calculated the effect of natural illumination upon the relief, it remains true that they are eminently pictorial compositions in respect of their depth of focus, yet without sacrifice of plastic effect (Plate II. fig. 14). So far as bas-relief is concerned, the problem of superimposing form in open space is here solved. Equally admirable in technique, though of less historical importance, are the circular medallions (touzis) which now adorn the Arch of Constantine, but originally belonged (as the present writer has shown) to a monument of the Flavian period, perhaps the "temple of the Flavian house" erected by Domitian. The one shown (Plate III. fig. 18) is remarkable in that the head of the emperor has been replaced by a portrait, not of Constantine, but (in all probability) of Claudius Gothicus (A.D. 268–70), who was the first to divert these sculptures from their original destination.

Flavian portraits, of which two are here figured,—a bust of Vespasian in the Museo delle Terme (Plate I. fig. 4) and a bust, now in the Lateran, found in the tomb of the Haterii, which, as is shown by the snake, represents a physician (Plate I. fig. 5)—must rank as the masterpieces of Roman art. Their extraordinarily lifelike character is due to the fact that the artist, without accumulating unnecessary detail, has contrived to catch the characteristic expression of his subject, and to render it with the utmost technical virtuosity. These portraits, unlike the portraits of the Roman emperors, who always substituted the individual to the type, and therefore gave a less complete impression of reality than the Roman artists.

The same tendency has been noted in ornamental work which may be dated to the Flavian period. Wickhoff selected a pilaster from the monument of the Haterii (Plate II. fig. 15) upon which a column entwined with roses is carved. The flowers are not in fact represented with precise fidelity to nature, but the illusion of reality is no less great than in more accurately worked examples.

Roman sculpture soon passed the zenith of its achievement. We are not able to assign any historical monuments to the earlier years of Trajan's reign, but the portraits of the emperor betray a certain hardness of touch which makes them less interesting than those of the Flavian period. To the latter part of the reign belong a number of monuments which represent Trajanic art at its best. First and foremost come the reliefs, colossal in scale, which appear to have decorated the walls of Trajan's Forum. Four slabs were removed by Constantine's order and used for the central dome of the Lateran, and the two sides of the attic of his Arch. The first of these (Plate II. fig. 16) shows the victorious charge of the Roman cavalry, with the emperor at its head, against their Dacian enemies. Other fragments of this frieze are extant in the Louvre, and a much-restored relief, walled up in the garden of the Villa Medici, shows a Dacian on horseback swimming the Danube with Trajan's Bridge in the background. The composition of the battle-scene is very fine, and the heads of the Dacians are full of character; but, although details of armour, &c., are carefully and accurately reproduced, we see clear signs of technical decadence, both in the fact that the human eye is in many cases represented as though in full face on heads which are shown in profile, and also in the naïve attempt to render several files of troops in perspective by means of superposed rows of heads. The reliefs of the spiral column in the Basilica Ulpia tell the same tale. The designer borrowed certain motifs from Hellenistic art; e.g. we find the suicide of the Dacian king Decibalus represented in precisely the same way as that of a Gallic chief on the well-known sarcophagus in the Capitoline Museum representing a battle between Greeks and Gauls; again, the symmetry of the scene in which the fall of Sarmizegetusa (the Dacian capital) is depicted recalls that of Greek monuments—particularly the painting of the fall of Troy by Polygnotus, described by Pausanias at Delphi. But the loving care with which the arms and accoutrements of the Roman troops—both regular and irregular—are rendered betrays the nationality of the artist; and his technical deficiencies, especially in the matter of perspective, point in the same direction. It seems probable, moreover, that the artistic conception of a column ornamented with a band of relief was new, and that the designer had to find his own solution for the problem. We find, in fact, that he tells his story in more than one way: (a) Considerable portions of the narrative, e.g. Trajan's march in the opening campaign, consist in a series of isolated and successive scenes; the divisions are usually marked by some conventional means, such as the insertion of a tree, or a change of direction in the action. (b) At other times the scenes unfold themselves against a continuous background in which the artist intermixes those which succeed them; to this form of narrative the term "continuous style," brought into use by Wickhoff, more properly applies. (c) The direct progress of the narrative is sometimes broken by passages which can only be called "panoramic"; the great composition showing the siege and fall of Sarmizegetusa falls under this head, and the "continuous" narration of Trajan's journey at the outset of the second war is followed by an extensive panorama illustrating the operations in Moesia in a.D. 105.

The reliefs (as already indicated) tell the story of both of Trajan's wars with the Dacians, a formal division between the two narratives being made by a figure of Victory setting up a trophy; and the design of the second series shows a decided advance in artistic and dramatic effect on that of the first. Clearly the artist learned the laws of composition applicable to his problem in the course of his work.

Before leaving the Trajanic period a word must be said as to the arch erected at Benevento (see Triumphal Arch, fig. 2), from which point a new road—the Via Trajana—ran to Brindisi. The arch bears the date A.D. 114, but the prominence given to Hadrian has led to the supposition that the reliefs were executed after his accession. We have already noted that the use of relief as ornament is here carried to excess in the artist's desire to present a summary of Trajan's achievements at home and abroad. The arrangement of the panels is calculated and significant. On the side which faces the town of Benevento the subjects have reference to Trajan's work in Rome. On the attic we see, to the left, a group of gods with the Capitoline triad—Jupiter, Juno and Minerva—in the foreground; to the right, Trajan welcomed at the entrance to the Capitol by the goddess Roma, the penates and the consuls. He is accompanied by Hadrian, who is designated by the gesture of Roma as the emperor's successor. The two lowest panels likewise form a single picture. To the right Trajan appears at the entrance of the Forum, where he is welcomed by the praefectus urb; to the left, with the Curia as background, we see the representatives of senate, knights and people. The central panels symbolize the military and civil aspects of Trajan's government—victories to left, merchants to right, are the recipients of imperial favour. On the other hand the subject see Mr. Crew's paper in Journal of Hellenic Studies, xx. (1900) pp. 31 ff. A list of examples is given by Mr. Wace in Papers of the British School at Rome, vol. iii., pp. 290 ff.

2 Mr. Wace has recently identified the reliefs which show an emperor sacrificing before the temple of Jupiter Capitolinus as a part of the frieze (Papers of the British School at Rome, iv. pp. 229 ff.).

3 These features make it clear that the reliefs in the Villa Borghese, formerly supposed to belong to an arch of Claudius, are Trajanic; see Papers of the British School at Rome, iii. pp. 215 ff. (Stuart Jones).

4 The significance of these reliefs was first demonstrated by Domaszewski (Jahreshefte des österreichischen archäologischen Institutes, ii. 1899, pp. 175 ff.); a full account will be found in Mrs Strong's Roman Sculpture, ch. 9.
face of the arch we have a series of panels relating to Trajan’s work in the provinces. On the attic the gods of the Daunian province appear, at the left, the invasion of Mesopotamia on the right; the lowest panels represent negotiations with Germans (left) and Parthians (right); in the centre (as on the other face) we have a military scene (recruiting in the provinces) to left, balancing the foundation of colonies and growth of the 
proles Romana on the right. As the above description will show, this arch is, in respect of its significance, the most important monument of Roman historical art. Technically, the reliefs fall somewhat short of the best work of the Flavian period—the long panels of the archway, which represent a 
sacrifice offered by Trajan and his benefactions to the municipia of Italy, have not the 
serve of those from the Arch of Titus, but are at least as fine as the works executed for Trajan’s Forum.

With the accession of Hadrian—the “Greekling,” as he was called by his contemporaries—a short-lived renaissance of classicism set in. The eclectic modifications of Greek statutory types which it called forth do not fall within our province; but it should be noticed that in portraiture the most important work of this period was the idealized type of Antinous, here represented by a famous example (Plate I. fig. 6) in the Louvre, which invests the favourite of Hadrian with a divinity expressed in the terms of Hellenic art as well as a pathos which belongs to his own time. The historical monuments of this and the following reign are few in number, and lack the pregnency of meaning and vigour of execution which distinguish those of the Trajanic period; mention may be made of three reliefs in the Palazzo dei Conservatori, one of which represents the apotheosis of an empress, and of the panels in the Palazzo Rondinini shown by the analogy of a medallion of Antoninus Pius to belong to his time. This is also the place to take note of the ideal figures symbolical of the subject peoples of the Empire. Under Trajan Roman sculptors had produced the fine statues of Daian captives which now adorn the Arch of Constantine; to the Hadrianic period belong the idealized figures of provinces, classical in pose and motive, several of which are in the Palazzo dei Conservatori. We pass on to the period of Marcus Aurelius and Commodus, in which Roman art underwent a further transformation. The earliest monument of the time which calls for our attention is the base of the column (now destroyed) erected in honour of Antoninus Pius. Two of its faces are here shown (Plate IV. figs. 21 and 22), and the contrast is remarkable between the classicistic representation of the apotheosis of Antoninus and Faustina, witnessed by the ideal figures of Rome and the Campus Martius (holding an obelisk), and the realistic treatment of the décor, a ceremony performed by detachments of the praetorian guard on horse and foot. We note the endeavour of the Roman sculptor to express more than his medium will allow, and his inadequate grasp of the laws of proportion and perspective. Discarding the classical standard and dependence on his figures as in a child’s toys, and, when confronted with the problem of the background, waves it aside and reduces the indication of the place of action to a few projecting ledges on which his puppets are supported. The reliefs of the Column of Marcus Aurelius suffer by comparison with those of Trajan’s Column. The story which the designer had to tell was doubtless less definite in outline; we cannot trace, as in the former instance, the march of events towards a dramatic climax, and there is some reason to think that, although the two bands of relief, separated (as on Trajan’s Column) by a figure of Victory, correspond generally with the “Germanic” and “Sarmatic” wars of Marcus down to A.D. 178, the narrative is not strictly chronological; thus the fall of rain ascribed by Christian tradition to the prayers of the “Thundering ” Legion

3 It is in the portraits of the Hadrianic period that we first meet with the plastic rendering (in marble) of the iris and pupil of the eye: on the significance of this convention see above.

On these see Lucas’s article in Jahrb. des k. deutschen arch. Instituts (1900), pp. 1 ff., and Mrs Strong, Roman Sculpture, pp. 243 ff.

(Plate IV. fig. 24) is represented at a very early stage, whereas our historians place it towards the close of the war. The figures are smaller and at the same time more crowded than those upon Trajan’s Column, and the landscape is less intelligently rendered. The type of the rain-god, which is without doubt the creation of the Roman sculptor, is boldly conceived but scarcely artistic. Still the reliefs show that the designers of the time were making vigorous efforts to think for themselves, and for this reason possess a higher value than the more conventional panels now distributed between the attic of the Arch of Constantine and the Palazzo dei Conservatori, which seem to have decorated a triumphal arch set up in or after A.D. 176.4 The portraiture of the time also shows the invasion of new principles. Even before the reign of Marcus we find a tendency to emphasize the contrast between hair and flesh, the face often showing signs of high polish. In the latter half of the 2nd century the contrast is heightened by a new method of treating the hair, which is rendered as a mass of curls deeply undercut and honeycombed with drill-holes; a fine example is the Commodus of the Palazzo dei Conservatori. The aim of the sculptor is to obtain an ornamental effect by the violent contrast of light and dark—an adaptation for the purposes of plastic art of the chiaroscuro which more properly belongs to painting. This tendency may be seen at work in all branches of sculpture. The sarcophagi of the Antonine and later periods, with their crowded compositions and deep shadows, have the same pictorial effect; and in pure ornament the vivid illusionism of Flavian art disappears, and, though plant-forms are lavishly used—from the time of Trajan onwards we note a growing distaste for pure outlines, which are hidden beneath all-pervading acanthus foliage—

the interest of the sculptor comes to lie more and more in intricacy of pattern, produced by the complementary effect of lights and shadows. An instance of this may be found in a pilaster now in the Lateran Museum (fig. 39), which Wickhoff justly contrasts with the rose-pillar from the monument of the Haterii. It is all-important to remember that (as Strzygowski has pointed out) it is not true shadow which is contrasted with the high lights in later Roman ornament; if so, the plastic effect of the free members would be heightened, whereas the reverse is actually the case for even the figures on sarcophagi, worked in the round though they be, do not stand out from the background—which indeed is practically abolished—but seem rather to form elements in a pattern. The reason is that pure darkness is set off against the high lights, and the whole surface being thus broken up, there remains no impression of depth.

Under Septimius Severus and his successors, Roman art drifts steadily in its new direction. The reliefs of his arch at the entrance to the Forum represent the emperor’s campaigns in the East in a compromise between bird’s-eye perspective and the “continuous” style which cannot be called successful;

4 This series of panels is discussed in Papers of the British School at Rome, vol. iii. p. 251 ff.

Jahrbuch der preussischen Kunstsammlungen (1904), p. 271.

Fig. 39.—Pilaster with Oak Leaf Ornament.
a better example of the art of this period is to be seen in the relief (Plate IV. fig. 28) now in the Palazzo Sacchetti, recently published by Mr A. J. B. Wace, which probably represents the presentation of Caracalla to the senate as the destined successor of his father. The squat figures of the senators, their grouping, which, though not lacking in naturalism and a certain effectiveness, is not in its main lines aesthetic, and the lavish use of deeply drilled ornament, are features which leave no doubt as to the period to which this work should be assigned. Rome, however, could still boast a school of portrait-sculptors, whose work was of no ordinary merit. The bronze statue of Septimius Severus, which passed into the Somzée collection, has been pronounced by Furtwängler to be of much earlier date, except for the head of the emperor, and we cannot therefore feel confidence in using it as a measure of the artistic achievements of Severus's reign; but the busts of Caracalla, which represent the tyrant in his later years, are masterly both in conception and in execution.

In the second quarter of the 3rd century A.D., when the Empire was torn by internal strife, threatened in its very existence by the inroads of barbarism, and hastening towards economic ruin, art could no longer flourish, and monuments of sculpture become 'scarce, if we except portraits and sarcophagi. By the latter half of the 3rd century, however, a new energy was recovering the art; the treatment of the hair and beard, which seem to have been closely clipped, and are indicated by a multitude of fine chisel strokes on a roughened surface. But, rough as these technical methods may seem, the artists of the time used them with wonderful effect, and the portraits of the emperor Philip (A.D. 244–49) in the Braccio Nuovo, and an unknown Roman in the Capitoline Museum (Plate I. fig. 7), are hardly to be surpassed in their delineation of craft and cruelty. Amongst the sarcophagi of the 3rd century we select, in preference to those adorned with scenes of Greek mythology, the fine example in the Musco delle Terme (formerly in the Ludovisi collection) decorated with a multitude of Romans and Orientals (Plate IV. fig. 23); the principal figure—whose portrait is also to be seen in the Capitoline Museum—has been identified by Mr A. H. S. Yeames as C. Furius Sabinus Aquila Timethesius, the minister and father-in-law of Gordian III. (d. A.D. 244).

Even after the middle of the century, when the Empire was for a time dismembered, portrait-sculpture put forth fresh evidences of life and vigour. Gallienus, who had himself a dilettante and dilettante-like tendencies, was himself represented by a series of portraits that fixed his personal image, as those of where he called into being a naturalistic school of sculptors, who marked back to the models of the later Antonine period, so that it is not always easy to distinguish the busts of his time from those of a much earlier date. The Louvre bust of the emperor (Plate I. fig. 8) will serve as a type of these works. But this singular renaissance was as short-lived as the ecletic revival of classicism under Hadrian. It is remarkable that the portrait of Gallienus is the last which can be identified by truly individual traits. The period of storm and stress which followed his death has left little or no monumental material for the historian of sculpture; and when the curtain again rises on the art of the new monarchy founded by Diocletian and perfected by Constantine, we seem to move in a new world. The East has triumphed over the West. Just as in Egyptian and, speaking generally, in all oriental art, before the revelation of true plastic principles, which we owe to the Greek genius, the law of "frontality" was universally operative, i.e., the pose of sculptured figures was rigidly symmetrical and without lateral curvature, so the portraits of Constantine and his successors are discerned at a glance by their stiff pose and fixed and stony stare. The fact is that the secret of organic structure has been lost; the bust (or statue) is no longer a true portrait, a block of marble made to pulsate with the life of the subject represented, but a monument. It was thus that the absolute monarchs of the Empire, before whom their subjects prostrated themselves in mute adoration, preferred to be portrayed; and we cannot help recalling Ammianus's description of the entry of Constantius II. into Rome (A.D. 355).

The emperor rode in a golden chariot, turning his head neither to the right nor to the left, but gazing impressively before him "tanquam pigmentum hominis." The description fits such a portrait as that of an unknown personage of the 4th century in the Capitoline Museum (Plate I. fig. 9), which has found a panegyrist in Rieg]. It remains to note that the narrow bands of relief on the Arch of Constantine, some of which probably date from the reign of Diocletian,² partake of the same monumental character as the single statues of the time. Where the nature of the subject permits, as in the case of the reliefs here represented (Plate III. fig. 19), the frontality of the central figure, and the strict symmetry of the grouping, which imparts an almost geometrical regularity to the main lines of the composition, are calculated for architectonic rather than for plastic effect. The breath of organic life has ceased to inspire the marble.

We have confined ourselves in the above section to tracing the course of development in what we may call official Roman sculpture, represented in the main, as is natural, by the monuments of the capital. The products of local schools cannot here be treated in detail. The difficult problems which these present are little illustrated by the case of Trajan's "邵nopfory" at Adam-Kilasi in the Dobruja. Although the very name of the monument might seem to furnish sufficient evidence of its date, the late Professor Furtwängler stoutly maintained that Trajan did but restore a monument dating from 29 B.C. He called attention to the uniformity in style of the grave-monuments of soldiers from north Italy, serving in the legions of the Rhine and Danube; these date from the early imperial period, and represent (according to Furtwängler) a traditional "legionary style." It may be admitted that they are eminently Italian in their hard realistic character; but the tradition was not extinct in the Trajanic period, so that the analogy between these monuments and its rudely carved figures is inconclusive, and the ornament of the trophy, which is far from being homogeneous, contains, as Studniczka⁴ has observed, oriental elements which could not possibly be found in sculpture of the 1st century B.C. Local tradition may also be traced, e.g., in southern France, where the Hellenic influence which penetrated by way of Massilia was still strongly felt under the Gallo-Roman dynasty, as the sculptures of the tomb of the ill at St Rémy and the triumphal arch at Orange and Carpentras suffice to prove. Gallo-Roman art, on the other hand, has a physiognomy of its own, whose outlines have been traced by M. Salomon Reinach (Antiquités nationales; bronze figures de la Gaule romaine, Introduction). In the Rhineland we find, at a later period, a singular school of realistic sculptors at work; the museum at Trier contains a number of their grave-monuments decorated with scenes of daily life.⁵ Nor must we omit to mention the Palmyrene sculptors of the 3rd century A.D., whose portrait-statues give us the clue to the origin of the "frontal" style of the Constantinian period.

(c) Painting and Mosaic.—The arts whose proper medium is colour enjoyed a popularity with the ancients and with the Romans, no less than with the Greeks, at least as great as that of sculpture; we need go no further for evidence of this than the statement of Pliny⁶ that Julius Caesar paid eighty talents (£20,000) for the "Ajax and Medea" of Timonachus of Byzantium, which he placed in his newly built forum, but which are in a difficult position when we try A. Attaina, Marc. xvi. 10. 10.

to estimate the artistic value of the masterpieces of ancient painting, since time has destroyed the originals, and it is but rarely that we can even recover the outlines of a famous composition from decorative reproductions. For the history of Greek painting we have in Pliny’s *Natural History* a fairly full literary record; but this fails us when we come to Roman frescoes, previous works, worthy to be ranked with the monuments of Roman art.

Painting in Italy was throughout its early history dependent on Greek models, and reflected the phases through which the art passed in Greece. Thus the frescoes which adorn the walls of Etruscan chamber-tombs show an unmistakable analogy with Attic vase-paintings. The neutral background, the use of conventional flesh-tones, and the predominant interest shown by the artists in line as opposed to colour, clearly point to the source of their inspiration; and the fine sarcophagus at Florence depicting a combat between Greeks and Amazons, in which we first trace the use of naturalistic flesh-tints, though it bears an Etruscan inscription, can hardly have been the handwork of native artists.

Roman tradition tells of early wall-paintings at Ardea and Latium, which existed before the foundation of Rome; and the Etruscan frescoes mentioned above may serve to give some impression. We also hear of Fabius Pictor, who earned his cognomen by decorating the temple of Salus on the Quirinal (392 b.c.); and a few more names are preserved by Pliny on account of the trivial anecdotes which attached to them. The chief works of specifically Roman painting in Republican times (other than the frescoes which adorned the walls of temples) were those exhibited by successful generals on the occasion of a triumph; thus we hear that in 263 b.c. M. Valerius Messalla was the first to display in the Curia Hostilia such a battle-piece, representing his victory over Hiero II. of Syracuse and the Carthaginians. We may perhaps form some idea of these paintings from the fragment of a fresco discovered in a sepulchral vault on the Esquiline in 1889, which appears to date from the 3rd century b.c. This painting represents scenes from a war between the Romans and an enemy who may almost certainly (from their equipment) be identified as Samnites; the names of the commanders are indicated, and amongst them is a Q. Fabius, probably Q. Fabius Maximus Rullianus, who played a part in the third Samnite War. The scenes are superposed in tiers; the background is neutral, the colour-scale simple, and there is but little attempt at perspective; but we note the files of superposed heads in the representation of an army, which are found at a later date in Trajanic sculpture.

We pass from this isolated example of early Roman painting to the decorative frescoes of Rome, Herculaneum and Pompeii, which introduce us to the new world conquered by Hellenistic artists. The scheme of colour is no longer conventional, but natural flesh-tints and local colour are employed; the “artist understands,” as Wickhoff puts it, how to “concentrate the picture in space” instead of isolating the figures on a neutral background; he struggles (not always successfully) with the difficult problems of line and aerial perspective, and contrives in many instances to give an “atmosphere” to his scene; the modelling of his figures is often excellent; finally, he can, when need requires, produce an effective sketch by conventional methods. It must be premised that this style of wall-decora-

the marble decoration of more sumptuous rooms; by introducing columns and other architectural elements he endeavours to give the illusion of outer space, and this is heightened by the landscapes, peopled, it may be, with figures, which form the background. We shall take as an example of such decoration one of the “Odyssey landscapes” discovered on the Esquiline in 1849; these may be amongst the more recent works of this school, but can scarcely, from the character of their surroundings, be later than the reign of Claudius. Amongst the remains of a large private house was a room whose walls were decorated in their upper portion with painted pilasters treated in perspective, through which the spectator appears to look out on a continuous background of land and sea, which is diversified by scenes from the voyage of Odysseus. It is clearly to such works as these that Vitruvius refers in a well-known passage (vii. 5) where, in describing the wall-paintings of his time, he speaks of a class of “*paintings on a large scale which represent images of the gods or unfold mythical tales in due order, as well as the battles of Troy or the wanderings of Odysseus through landscapes*”.

And it is worthy of note that in a chamber discovered in the 18th century below the Flavian state-rooms on the Palatine (see Rome, the survey of these rooms with the poems of Pliny’s). In the fragment preserved of a wall-painting from which we have some idea of the style of the time, through which the spectator appears to look out on a continuous background of land and sea, which is diversified by scenes from the voyage of Odysseus. It is clearly to such works as these that Vitruvius refers in a well-known passage (vii. 5) where, in describing the wall-paintings of his time, he speaks of a class of “*paintings on a large scale which represent images of the gods or unfold mythical tales in due order, as well as the battles of Troy or the wanderings of Odysseus through landscapes*”. And it is worthy of note that in a chamber discovered in the 18th century below the Flavian state-rooms on the Palatine (see Rome, the survey of these rooms with the poems of Pliny’s). In the fragment preserved of a wall-painting from which we have some idea of the style of the time, through which the spectator appears to look out on a continuous background of land and sea, which is diversified by scenes from the voyage of Odysseus. It is clearly to such works as these that Vitruvius refers in a well-known passage (vii. 5) where, in describing the wall-paintings of his time, he speaks of a class of “*paintings on a large scale which represent images of the gods or unfold mythical tales in due order, as well as the battles of Troy or the wanderings of Odysseus through landscapes*”. And it is worthy of note that in a chamber discovered in the 18th century below the Flavian state-rooms on the Palatine (see Rome, the survey of these rooms with the poems of Pliny’s). In the fragment preserved of a wall-painting from which we have some idea of the style of the time, through which the spectator appears to look out on a continuous background of land and sea, which is diversified by scenes from the voyage of Odysseus. It is clearly to such works as these that Vitruvius refers in a well-known passage (vii. 5) where, in describing the wall-paintings of his time, he speaks of a class of “*paintings on a large scale which represent images of the gods or unfold mythical tales in due order, as well as the battles of Troy or the wanderings of Odysseus through landscapes*”.

The use of landscape in decoration is expressly stated by Pliny (H.N. xxxv. 116) to have become fashionable in Rome in the time of Augustus. He attributes this to a painter named Studius, who decorated walls with “villas, harbours, landscape gardens, groves, woods, hills, fishponds, canals, rivers, shores,” and so forth, diversified with figures of “persons on foot or in boats, approaching the villas by land on donkeys or in carriages, as well as fishers and fowlers, hunters and even vintagers.” Vitruvius, too, in the passage above quoted, speaks of “*harbours, capes, shores, springs, streets, temples, groves, mountains, cattle and herdsmen*”; and existing paintings fully confirm the statements of ancient writers. In the Villa of Livia at Prima Porta the walls of a room are painted in imitation of a park; from the Villa of Fannius Synistor at Bosco Reale we have a variety of landscapes and perspectives; and in the house discovered in the gardens of the Villa Farnesina by the Tiber we find a room decorated with black panels, upon which landscapes exactly corresponding to Pliny’s description are sketched in with brush strokes of white paint. While we have no reason to dispute the accuracy of Pliny’s statement, or to refuse credit to the Roman artist for the development of landscape decoration, it is to be noted that the summary methods of impressionist technique which are here employed are probably traceable to Alexandrian influence. Petronius, who puts into the mouth of one of his characters a lament over the decline of art, attributes the decadence of painting to the “audacity of the Egyptians” and their discovery of “a short cut to high art” (*lam magnae artis compendiaris*). This has been thought to mean no more than the process of fresco-painting, which led to the substitution of

4. *Bulletino Comunale* (1889), pl. xi. xii.
of course, the composition is formed by the juxtaposition of sculpturesque types, after a fashion familiar to Roman wall-painters. Mention may here be made of the combination of ornamental work in plaster with painting which is found at Pompeii, in the work of the Flavian period at Rome, and in tombs of the 2nd century A.D. In the Augustan period we find exquisitely modelled relief-work in plaster, used to ornament vaulted surfaces in the “Farnesina” house; it might seem natural to treat of these under the heading of Sculpture, but in point of fact they are translations from painting into stucco. At a later time both painter and modeller worked in conjunction, with admirable effect; the results are best seen in the tombs on the Latin Way.

Little can be said as to Roman portrait-painting. We know that in this branch of art the technique generally used was that called “encaustic.” The colours were mixed with liquefied wax and fixed by heat; whether they were applied in a molten state or not has been disputed, but it seems more likely that the pigments were laid on cold, and a hot instrument used afterwards. Several examples of such wax-paintings have been found in Egypt, where it was the custom during the 2nd and 3rd centuries A.D. to substitute panel portraits for the plastic masks with which mummy-cases were adorned; but these cannot be described as works of high art, though they sometimes have realistic merit. A good example in the Berlin Museum (Antike Denkmäler, ii. pl. 13) is executed in tempera on primed canvas. The medium used in ancient as in medieval tempera painting appears from the statements of ancient writers to have been yolk of egg mixed with fig-sap or natural gums.

To the little we know of purely Roman painting something is added by that which we learn from the remains of the sister art of mosaic, which, being less easily destroyed, have survived in large numbers to the present day. It has been estimated by Gauckler that considerably more than 2000 mosaics with figure-subjects have been discovered; and the number is steadily increasing. For the origin of the art reference may be made to the article Mosaic, where the reader will also find enumeration of the essential differences of principle between the arts of painting and mosaic. It is to the credit of the Roman artists that they were, generally speaking, alive to this distinction of method, and did not seek to produce the impression of painting executed with a liquid medium by the use of solid materials. Indeed, it seems not improbable that in this respect they had a truer conception of the function of mosaic decoration than their Greek forerunners. Amongst the mosaics of Roman date which employ a large number of exceedingly minute cubes in order to produce an illusion akin to that of painting, the most conspicuous examples are the pavement in the Lateran Museum signed by the Greek Heraclitus, which appears to reproduce the “unseen hall” of Sosos of Pergamum (see Mosaic), and the Mosaic of the Doves from Hadrian’s Villa, preserved in the Capitoline Museum, which may be supposed to have been inspired by the “drinking dove” of the same artist. The former of these contains about 120, the latter as many as 160 cubes to the square inch.

At home in the chapter on mosaic (Plate VI. fig. 29) we may see the distinction drawn between opus tessellatum, consisting of cubes regularly disposed in geometrical patterns, and opus vermiculatum, in which a picture is produced by means of cubes irregularly placed. The two methods were commonly used in conjunction by the Romans, who recognized that a pavement should emphasize the form of the room to which it belonged by means of a geometrical border, while figure-subjects should be reserved for the central space. A good example is furnished by a mosaic pavement discovered on the Aventine in 1838, and preserved in the Museo delle Terme (Plate VI. fig. 29). Enclosed within a geometrical framework of guilloches and scroll-work, diversified with still-life subjects and scenic masks which break its monotony, we find a landscape evidently taken from the banks of the Nile, as the hippopotamus and crocodile, as well as the papyrus and lotus, clearly show. These Egyptian scenes are likewise found

1 The Elder Pliny’s Chapters on the History of Art, p. 238.
2 The most striking example is that from the “House of Livia” on the Palatine.
ROMAN ART

at Pompeii, and the celebrated pavement at Palestina, with a bird's-eye view of the Nile and its surroundings, is the finest, as well as the latest, example of the class. The conclusion to be drawn is that the Roman mosaic-workers of the early Empire owed much to Alexandrian models. Their finer works, however, were restricted in size, and formed small pictures isolated in geometrical pavements. Such mosaic-pictures were called *emblemata*, and were often transported from the great centres of production to distant provinces, where pavements were prepared for their reception. The subjects of these *emblemata*, like those of the wall-paintings of Pompeii, were, for the most part, taken from Greek mythology, and it is not easy to determine what degree of originality is to be assigned to Roman artists. We note a certain interest in the great figures of literature and philosophy. A subject of which two somewhat different versions have been preserved, commonly known as "The Academy of Plato," shows us a group of Greek philosophers engaged in discussion. In provincial pavements it is not uncommon to find portraits of poets or philosophers used to fill ornamental schemes of decoration, as in the famous mosaic at Trier signed by Monnus. And it is possible to trace the growth of interest in Roman literature at the expense of that of Greece. Fig. 31 (Plate VI.) shows a mosaic discovered in the *tablinum* of a villa at Susa (Susa) in Tunisia (the ancient *Hadrumetum*). It represents the poet Virgil seated, with a scroll on his knee, upon which is written Aen. i. 8; beside him stand the muses of tragedy and history. In one of the side-wings (alae) of the atrium was a mosaic representing the parting of Aeneas from Dido, and this was no doubt balanced by another scene from the Aeneid. It has also been shown that the mythological scenes depicted by the mosaic-workers of the later imperial period are frequently inspired, not by Greek poetry or even Greek artistic tradition, but by the works of Ovid; and the popularity of the legend of Cupid and Psyche is doubtless to be traced to its literary treatment by Apuleius.

The mosaic shown in fig. 31 is notable for the simplicity of its composition; and it may be laid down as a general rule that the later workers in this field preferred such subjects, consisting of few figures on a neutral background, which lend themselves to broad treatment, and are best suited to the genius of mosaic. The finer pavements discovered in the villas of the landed proprietors of the African provinces, Gaul, and even Britain, are distinguished by the excellent taste with which ornament and subject are adapted to the space at the disposal of the artist. Beside a well-chosen repertory of geometrical patterns, the mosaic-workers make use of vegetable motives taken from the vine, the olive, the acanthus or the ivy, as well as conventional figures, such as the seasons, the winds, the months and allegorical figures of all kinds, forming elements in a scheme of decoration which, though often of great richness, is never lacking in symmetry and sobriety.

It is much to be regretted that the destruction, partial or complete, of the great thermæ and palaces of the early Empire has deprived us of the means of passing judgment on the *opus musivum* proper (see Mosaic), i.e. the decoration of vaults and apses. Some mosaics with *opus musivum* or precious materials. Effective as are the pavements constructed with tesserae of marble or coloured stone, they must have been eclipsed by the brilliant hues of the wall-mosaics. We can form but little idea of these from the decoration of fountains at Pompeii and elsewhere, and must depend chiefly on the compositions which adorn the walls and apses of early Christian basilicas. An attempt has, indeed, been made to prove that one of these—the church of S. Maria Maggiore—is nothing else than a private basilica once belonging to a Roman palace, and that its mosaics date from the period of Septimius Severus; but it is impossible to accept this theory. The earliest monument of the class which we are now considering is the baptistery of S. Costanza at Rome, built by Constantine in the early years of the 4th century A.D. Unfortunately the mosaics of the cupola were destroyed in the 16th century, and we derive our knowledge of them from drawings made by Francesco d'Olanda. The tambour was decorated with a maritime landscape diversified with islands and filled with a crowd of *putti* fishing, and the cupola itself was divided into twelve compartments, containing figure-subjects, by acanthus motives and caryatids. The mosaics of the annular vault which surrounds the baptistery are extant, though much restored, and purely pagan in design, showing that the decorative schemes (Eros and Psyche, vine-patterns, medallions, &c.), commonly found in pavements were also used by the *musivarii*. The mosaic-panels of the nave of S. Maria Maggiore already mentioned are (in the absence of earlier examples) very instructive as to the artistic quality of Roman *opus musivum*. Richter and Taylor's publication of some of the unrestored portions, which unfortunately form but a small fraction of the whole, serve to show that the *musivarii* had an accurate conception of the true function of mosaic destined to be seen at a distance. Their effects are produced by a bold use of simple means; a few large cubes of irregular shape serve to give just the broad impression of a human face or figure which lends the monumental surroundings and subdued light. Very remarkable is the success with which sky and ophthalmic backgrounds are treated. To seek delicate gradations of tint by elaborate means would be waste of labour for the mosaic-worker, but the artists of S. Maria Maggiore are able to produce sky and cloud effects (cf. Plate V. fig. 23) of great beauty, when seen from the floor of the church, with the aid of broad masses of colour. Their gamut of tones is the richest; and it is to be remarked that *no gold* is used except in the restored parts. Doubtless gold was employed in decorative wall-mosaics before the Constantinian period; but the Roman *musivarius* knew the secret of making a true mosaic picture with natural tints alone.

(4) Work in Precious Metals.—In the article *Plate* the history of this branch of art in ancient times is treated, and it is there shown that it continued to be a living art, capable of producing works of the highest merit, in Roman times. The sections of Pliny's *Natural History* (xxiii. 154 sq.) which treat of *caelatura* deal only with the works of Greek artists, and Pliny ends with the statement that, as silver-chasing was in his time a lost art, specimens of embossed plate were valued according to their antiquity; but the extant remains of Roman plate suffice to disprove his statement, and in a previous passage (xxxiii. 139) he names the principal ateliers where such works were produced. The famous treasure of Bosco Reale (see Plate) comprises specimens of silver-work belonging to various dates, many of which bear the inscription "Maxime"; this doubtless gives the name of the owner of the objects, whose skeleton was found near the treasure. But some of them had passed through other hands; for example, four "salt-cellar" probably pre-Roman date are also inscribed with the name of "Pamphilus, the freedman of Caesar." Certain pieces, too, seem older and more worn than others; two ewers, decorated with Victories sacrificing to Athena, are probably of Alexandrian origin; the lotus-flower on their handles most probably points to their Egyptian provenance. On the other hand, the various decorative and characteristic of the late 2nd century A.D., presented,—not merely the elaborate and conventional plants of the Ara Pacis Augustae, teeming with animal life, which adorn two splendid canthari, but also the naturalistic treatment of vegetable forms, of which a cup decorated with sprays of olive furnishes a good example (Plate VII. fig. 32). But the most important pieces in the collection are those which show the silversmith at work on specifically Roman subjects. Amongst the cups with *emblemata* (for the meaning of the term see Plate) were two which originally contained small portrait-busts of the master and mistress of the house to which the collection belonged. One of these became detached, and is now in the British Museum; the other is in the Louvre in its original setting. The lady's coiffure resembles that of the empresses of the later Julia-Claudian period; but this is not
ROMAN ART

conclusive as to date, and the style of the male portrait (which recalls the realistic bronze busts found at Pompeii) points rather to an early Flavian date. Amongst the finest pieces of this collection is a large bowl with an emblema in high relief (Plate VII. fig. 35), which was at first taken to represent the city of Alexandria, on account of the sistrum which appears amongst the attributes of the figure. It seems, however, to be a personification of the province of Africa, which was conventionally represented with a headdress formed by an elephant's scalp, with trunk and tusks. We have in this emblema the earliest example of the ideal types which the Roman artists of the Empire called into being to symbolize the subject-countries; the inexhaustible fertility of the African soil is indicated by the cornucopiae and the fruits carried in the bosom of the figure.

But there is some trace of that overcharging of symbolism to which we drew attention in discussing the Prima Porta statue of Augustus; and, though the bowl was in a very fine state of preservation, there is little doubt that this was due to the care with which it had been kept—it was of course an ornament reserved for the table or sideboard—and that we should date it to the Augustan period. The same is clearly true of the most important pieces comprised in the treasures of the pair of cups reserved to portray the homages of the Magi and former sardonyx collection (Plate VII. figs. 33 and 34). In these we have examples of the crustae, or plaques decorated in repoussé, which were mounted on smooth silver cups. The manufacture of these—or at least the designing thereof—was a special branch of caelatura, and Pliny mentions an artist named Teucer who achieved distinction therein; we may possibly identify him with the gem-engraver whose signature is read on an amethyst at Florence. Upon one of these (Plate VII. fig. 34), we see a seated figure of Augustus, approached by a processionual group on both sides. To the left are three divinities, the foremost of whom presents a statuette of Victory to the emperor; to the right is Mars in full panoply, in whose train follow the conquered provinces, symbolized by female figures, amongst whom we recognize Africa with her elephant headgear (see above). On the other face of the cup we see Augustus again seated, receiving the homage of a group of barbarians ushered into his presence by a Roman commander. The schemes which are here found for the first time, became typical in Roman historical art, and thence passed into the service of Chrétiens to portray the homage of the Magi. The second cup celebrates the glories of Tiberius, whose triumphal procession appears on the one face, and a finely conceived scene of sacrifice on the other. For the occasion various dates have been suggested (13–12 or 8–7 B.C.); but it seems most likely that the return of Tiberius from Dalmatia in A.D. 9 is here commemorated.

The fortunate preservation of the Bosco Reale treasure has enabled us to appraise Roman silverwork at its true value. It also affords some confirmation of the rapid decadence of the art, which Pliny laments. Amongst the cups are two decorated with still-life subjects and signed by an artist who writes a Roman name (Sabinus) in Greek characters, which clearly belong to the last years of Pompeii, and are coarser in execution than the earlier pieces. And the simple emblemat of the classical period, which stand out against the background of the bowl in which they are framed, give place to such a crowded group as we find on a gold patera1 found at Rennes and preserved in the Cabinet des Médailles, where the artist has surrounded the central emblema with a frieze which detracts from its effect. This and still later specimens of Roman silversmiths' work are described in the article PLATE.

5 Gem-Engraving and Minor Arts.—The art of the gem-engraver, like that of the silversmith, was naturally held in high esteem by the wealthy Romans both of the Republic and Empire; and the period of its highest excellence coincides almost precisely with that which gave birth to the masterpieces of Roman silver-chasing. By far the greater part of the ancient gems which exist in modern collections belong to the Roman period; and the great popularity of gem-engraving amongst the Romans is shown by the enormous number of imitative works cast in coloured glass paste, which reproduce the subjects represented in more precious materials. Not only were intagli thus produced to suit the popular demand, but fine cameos were at times cut (not cast) in coloured glass; the most notable example of these is a portrait of Tiberius in turquoise-coloured glass bearing the signature of Herophilus (see below).

In the style of Roman intagli we can trace each of the phases through which Roman plastic art has been shown to pass.2 A black agate in the Hague Museum (Furtwängler, pl. xlvii. 13) supplies a characteristic portrait of the Ciceronian age; the splendid cornelian of the Tyszkievicz collection (Furtwängler, pl. l. 19) with the signature ΠΩΠΙΑ ΑΒΑΒΝ which portrays Augustus in the guise of Poseidon in a chariot drawn by hippocamps, is doubtless (as Furtwängler showed) to be referred to the victory of Actium; the classicism of the earlier Empire is exemplified by a sardonyx in Florence (Furtwängler, pl. lx. 1), likewise erected in honour of the Emperor of the Julio-Claudian line with the attributes of Hera; a sardonyx in the hermitage at St Petersburg (Furtwängler, pl. lviii. 1) is noteworthy because the subject is borrowed from painting and occurs on a Pompeian fresco discovered in 1897; the portraiture of the Flavian epoch is seen at its best in the aquamarine of the Cabinet des Médailles signed by Euhodos, which represents Julia, the daughter of Titus (Furtwängler, pl. xlviii. 8). Amongst later gems one of the finest is the "Hunt of Commodus" in the Cabinet des Médailles (Furtwängler, pl. l. 41), which is engraved in one of the stones most popular with the Roman artists—the "Nicolo," a sardonyx with a bluish-grey upper layer used as background and a dark brown under layer in which the design is cut.

But the masterpieces of Roman gem-cutting are to be found in the great cameos, the finest of which no doubt belonged to the treasures of the imperial house. These were engraved in various materials, including single coloured stones such as amethyst or chalcedony; but the stone most fitted by nature for this branch of art was the sardonyx, by its rich variety of colours, the Interpretation given by the warm and subtle hues of its tones, and the Arabian, with a more subdued scale of colour. As examples of these we shall take the two master-works of the art—the "Grand camée de France" (Plate VII. fig. 37), and the "Gemma Augustea" (Plate VII. fig. 36), preserved in the imperial collection at Vienna. The latter is attributed by Furtwängler to Dioscorides, the artist who, as Pliny tells us, enjoyed the exclusive privilege of portraying the features of Augustus. We possess several gems inscribed with his name, as well as with those of his sons and pupils—Eutyches, Hero- philus (see above) and Hylos; and, though several of these are Renaissance forgeries, enough genuine material exists for an appreciation of his style. The Arabian sardonyx was amongst his favourite stones, and the Vienna cameo at least represents the work of his school. Blending the real with the ideal, the artist has represented in the upper zone Augustus and Rome enthroned. Behind them is a group of divine figures—the inhabited Earth, Time and Tellus, according to the most probable interpretation; to the left we see Tiberius descending from a chariot driven by Victory, before which stands a youth, probably Germanicus. We seem to have here, as in the Bosco Reale cup, a scene from the triumphal

1 Works of pure gold have but rarely survived to modern times; but traces of gilding remain upon many of the specimens of plate described above. In the law-books we have mention of cups adorned with golden crustae.

2 The references given in the text are to Furtwängler's great work, Die antiken Gemenen, in which all ancient gems of any considerable importance are reproduced.

procession of A.D. 12, in the course of which, as Suetonius tells us, Tiberius stepped down from his car and did homage to his stepfather. In the lower zone we find loosely composed groups of captives and Roman soldiers, some of whom are setting up a trophy.

But the supreme triumph of imperial jewelry is attained in the Great Cameo of the Bibliothèque Nationale. This is an Indian sardonyx cut in five layers, the largest extant example of its class. There is a marked advance on the Vienna cameo in composition; the lower zone is reduced to the proportions of an exergue, whilst heaven and earth are kept clearly apart in the main subject, yet at the same time united in a single picture. In the centre are the living members of the Julio-Claudian house—Tiberius and Livia enthroned, together with Germanicus, his mother, and the rising generation—while above them hovers the deified Augustus, together with other deceased members of the family and an ideal figure in Phrygian garb bearing a globe, probably Julius (Ascanius), or even Aeneas himself. The moment depicted is the departure of Germanicus for the East in A.D. 17, and amongst the figures of the central group, we note the muse of history, bearing a scroll upon which to record his deeds and a personification of Armenia.

Engraved gems are not the only examples of Roman work in precious materials. Amongst the most familiar of the first dynasty none is finer or more beautiful than the head of Agrippina the younger (recently acquired by the British Museum) in plasma (root-of-emerald), a material much used by Roman gem-cutters. Vases, again, were carved in precious stones, such as the famous onyx vase at Brunswick (Furtwängler, Die antiken Gemmen, figs. 185-88), adorned with reliefs relating to the mysteries of Eleusis. A smaller, but finer, onyx vase in the Berlin Museum (Furtwängler, op. cit., figs. 183, 184) represents the infancy of a prince of the Julian line—a rock surmounted by a small temple recalls the sculptures of the Ara Pacis, and the work seems to be of Augustan date.

It was mentioned above that coloured glass was used as a substitute for gems, and it is to the school which produced the cameos of the early Empire that we owe the exquisite vases in white and blue glass of which the Portland vase is the most famous example. Pompeii furnishes a second in the amphora, decorated with vintage scenes, in the Naples Museum.

We must also class amongst the fine arts that of the die-sinker. Not only are the imperial portraits found on coins worked on, but also the plates and the works of the sculptor, but in the "medallions" of the 2nd century A.D. we find figures of subjects, often recalling those of contemporary reliefs, treated with the utmost delicacy and finish.

Of the purely industrial arts it is unnecessary to speak at length. The finds made in Gaul, Germany and Britain have enabled archaeologists to trace their history—particularly that of pottery—in some detail; but the chief importance of these discoveries lies in the fact that they prove the gradual diffusion of artistic talent throughout the provinces. In the last century of the republic a flourishing manufacture of red-glazed pottery was established with its chief centre at Arretium (Arequz); the signatures of the vases enable us to distinguish a number of workshops owned by Romans who employed Greek or Oriental workmen. The repertory of decorative types used by these humble artists reflects the cross-currents of classicism and naturalism which were contending in the decadence of Hellenistic art; but, if we cannot set a high substantive value on their works, it is important to note that in the 1st century A.D. the Italian fabrics were gradually driven out of the market by those of Gaul, where the industry took root in the Cevennes and the valleys of the Rhone and the Allier; and before long north-eastern Gaul and the Rhineland became centres of production in the various minor arts, which continued to flourish until the breakdown of the imperial system in the 3rd and 4th centuries A.D.

(6) Summary: the Place of Roman Art in History.—Just as the establishment of the Roman Empire gave a political unity to the ancient world, and the acceptance of Christianity by its rulers assured the triumph of a universal religion, so the growth of a Graeco-Roman nationality, due to the freedom of intercourse between the subjects of the emperors, led to a unity of culture which found expression in the art of the time. Yet no sooner was the fusion of the elements which contributed to the new culture complete than the process of disruption began, which issued in the final separation of the Eastern from the Western Empire. In the first, the oriental factors, which produced a gradual transformation in Graeco-Roman art, definitely triumphed; and the result is seen in Byzantine art. But in the West it was otherwise. The realism native to Italy remained alive in spite of the conventions imposed upon it; the human interest asserted itself against the decorative. The Christian art of the West, therefore, is the true heir of the Roman, and, through the Roman, of the classical tradition. The mosaics of S. Maria Maggiore, already referred to, show how strongly this tradition was at work in the 1st century A.D. The cases where the Christian art of the 1st century A.D. such as the consular diptychs of ivory and the carved doors of S. Sabina at Rome, tell the same tale. As we have seen, Roman art in its specific quality was an historical art; and it was for this reason eminently fitted for the service of an historical religion. The earliest Christian art whose remains are preserved is that of the catacombs; and this is not only devoid of technical merit, but is also dominated by a single idea, which governs the selection of subjects—that of deliverance from the grave and its terrors, whether this be conveyed by scriptural types or by representations of Paradise and its dwellers. Not until the church's triumph was complete could she command the services of the highest art and unfold her sacred story on the walls of her basilicas; but, when the time came, the monumental art created by the demands of imperial pride was ready to minister ad majorem gloriam Dei.

BIBLIOGRAPHY.—F. Wickhoff's Roman Art (1900), translated by Mrs Strong from the author's Wiener Genesis, is well illustrated and indispensable to the student. A. Riegl's Spätromische Kunst (und Orient) (1906), and O. Sybel, Die römischen Grabreliefs (1907), the views of Strzygowski are expressed in a large number of monographs and essays; the most important are Orient oder Rom (1901), Kleinasien, ein Neuland der Kunsthistoriker (1903), Schmitt (Jahrbuch der deutschen Palastina-Verein 1903) Der Bau von Athen und seine Entstehung (1904), and articles in Byzantinische Zeitschrift, Byzantinische Denkmäler, and other periodicals. A summary of the debate raised by these writers will be found in the Quarterly Review, January 1906 (Stuart Jones). The controversy carried on by Furtwängler and Studniczka as to the date of the Trophy of Adam-Klissi is instructive. Furtwängler's articles appeared in the Transactions of the Munich Academy for 1903-4, Studniczka's ("Tragödie Traiani") in Abhandlungen der sächsischen Gesellschaft der Wissenschaften, xxii. (1904).

Of Roman sculpture Mrs Strong's handbook ( Roman Sculpture, 1907), which has a great number of excellent illustrations, gives a general survey. Special branches are treated by E. Courault (Les bas-reliefs romains de la République, 1896), W. Altmann (Die römischen Grabreliefs der Kaiserzeit, 1905), A. J. Wace ("The Evolution of Art in Roman Portraiture," Transactions of the British and American Archaeological Society of Rome, 1906). There has been much recent discussion of historical monuments in Rome in the Papers of the British School at Rome, the Römische Mitteilungen of the German Archaeological Institute, the Jahrbuch of the Austrian Archaeological Institute, and the Neue Jahresberichte des Preussischen Finanzministeriums and the Jahrbücher für Geschichte der Künste (O. Benndorf and others). Das Tropaion von Adamklissi (1895); E. Petersen, Ara Pacis Augustae 1903; further discoveries since this date are discussed by the author in Jahrbücher des österreichischen Archaeologischen Institutes, 1908-9, and in the Journal of Roman Studies (1904). C. Cichorius, Die Reliefs der Trajanssäule (1896-1900), criticized by E. Petersen, Trajans dakische Kriege.

1 The tradition that this was found in the well-known sarcophagus of the early 3rd century now in the Capitoline Museum, formerly supposed to contain the ashes of Severus Alexander, is without foundation.

* For bronze-work see Wilbers in Rheinisches Museum (1907), pp. 33 ff. This principle is consistently applied by von Sybel, Christliche Antike (Marburg, 1907).
ROMAN CATHOLIC CHURCH

(1899-1903); E. Ferrero, L’Arc d’Auguste à Suse (1901); E. Petersen (and others), Die Marcusäule (1896).

For Roman portraits J. Bernoulli’s Römische Iconographie (4 vols., 1882-94) gives abundant material but little aesthetic criticism. Many of the finest portraits are included in Arndt-Brunckmann’s series of Griechische Porträts, and Brunck-Brunckmann’s Denkmaler griechisch-römischer Skulptur contain reproductions of several Roman reliefs. The monuments collected by T. Schreiber under the title of Helenistischen Reliefbäder (1895) are datable.

For Roman painting we have as yet no handbook; W. Helbig’s Untersuchungen über die campaschie Wandmalerei (1873) are still of great value, though the theory advanced is overstated. His Campaschie Wandgemälde (1886) gives a catalogue of Pompeian paintings, and has been supplemented by A. Sogliano’s Le pitture murali Campane (1879). Those since discovered are described in the Notizie degli Scavi. A. Mau’s Geschichte der Wandmalerei is also indispensable. Hermann-Brunckmann, Denkmäler griechisch-römischer Skulptur (1894), gives reproductions partly in colour, of all important specimens of ancient painting. Le Nozze Allobrodine, &c., by B. Nozara (1907), contains both coloured and photographic reproductions of the paintings preserved in the Vatican library. For the Fourth-Roman portraits see G. E. Lessing’s Waldeman’s Antike Porträts (Leipzig, 1893); F. Petrie, Harwara, ch. vi.; and C. Edgar, Catalogue des antiquités du musée du Caire, “Gracco-Egyptian Coffins,” p. xx. The technique of ancient painting has been fully discussed by Helbig’s Compansionen der Wandgemälde should be consulted. P. Guardi’s sketchbook on the painting (La Peinture antique, n.d.) is slight. For the bibliography of mosaics see that article (especially Gauckler in Darmen and Soglio, Dictionnaire des antiquités, s.v. Musium Opus’); for wall paintings, see the monographs of A. Furtwängler’s Die antiken Gemmen (vol. i., 1900) is the standard work. The history of Roman pottery is summarized by H. B. Walters, History of Ancient Pottery, vol. ii. 430 ff.; the most important works are J. Déchelette, Les Vases de la Gaule romaine (1904), and H. Dragendorff’s articles on “Terra sigillata” in the Bonner Jahrbücher.

Sections on Roman art will be found in general handbooks, such as Springer-Michaela, Handbuch der Kunstgeschichte (6th ed., 1902); L. von Sybel, Weltgeschichte der Kunst (2nd ed., 1906); G. Gurli, Geschichte der Kunst, vol. i. (1902). (H. S. J.)

ROMAN CATHOLIC CHURCH, the name generally given to that great branch of the Christian Church which acknowledges the pope, or bishop of Rome, as its head, and holds as an article of faith that communion with and submission to the authority of the see of Rome is essential to effective membership of the Catholic Church as founded by Christ. This belief is based upon the commission given by Christ to Peter as “prince of the apostles,” “Feed my sheep” (John xxi. 15-17); the saying, “Thou art Peter, and upon this rock I will build my church; and the gates of hell shall not prevail against it” (Matt. xvi. 18); and the promise, “I will give unto thee the keys of the kingdom of heaven: and whatsoever thou shalt bind on earth shall be bound in heaven; and whatsoever thou shalt loose on earth shall be loosed in heaven” (Matt. xvi. 18, 19). The authority thus conferred upon St. Peter is held by the Roman Catholics to be permanently vested in the bishop of Rome, as successor to Peter, first bishop of the imperial see. As such, the pope is regarded as “vicar of Christ, head of the bishops, and supreme governor of the whole Catholic Church, of whom the whole world is the territory or diocese.” His peculiar powers as pope he exercises immediately on election. Thus he may grant indulgences, issue censures, give dispensations, canonize saints, institute bishops, create cardinals—in short, perform all the acts of his jurisdiction, even though he be no more a layman; but by custom certain of his more solemn acts are postponed till after the coronation of his pontificate, at which time his pontificate is officially dated. To exercise the actus ordinis of a priest or bishop, however, he must, if not already in orders, be specially ordained and consecrated. Hence his office is a dignity, not of order, but of jurisdiction (see PAPACY and POPE).

The most distinctive characteristic of the Roman Catholic Church, at least as contrasted with the various Protestant communions, is its vigorous insistence on the principle of ecclesiastical authority. Of this authority the pope is regarded as the centre and source, so far as the interpretation of the Divine Will to the world is concerned in matters of faith and morals. His pronouncements are held to be infallible when he defines a doctrine concerning faith or morals ex cathedra to be held by the universal church (see INFALLIBILITY and VATICAN COUNCIL).

The government of the Roman Catholic Church being centralised at Rome, an elaborate organization has been developed there for the administration of its affairs. At the head of this is the college of cardinals, who are the princes and successors of the Church, the counsellors of the pope, and his vicars in the functions of the pontificate. By those of them who are members of the various Congregations and other offices of the Curia the greater part of the government of the Church is directed. (For accounts of the organization of the Roman Curia the reader is referred to the articles CARDINAL and CURIA ROMANA.) The characteristic note of the Roman Curia is its intense conservatism and its slowness to move, whether in approving or condemning new developments of opinion or action. This is explained by the nature of its organization and by the tradition on which it is based. For, just as the Roman Church as a whole preserves in the spiritual sphere the spirit and much of the organization of the Roman Empire, so the administration of the Curia carries on the tradition of Roman government, with its reverence for precedent and its practice of deciding questions, not on their supposed abstract merits, but in accordance with the rules of law as defined in the codes or by previous decisions. Thus the genius of Rome remains, as it always has been, administrative rather than speculative. The great dogmas of the Christian Church were shaped by the interplay of the subtle wits of the theologians of the Oriental Churches. The new dogmas promulgated by the Holy See from time to time have been the outcome of the slow growth of ages, built up from precedent to precedent, and only defined at last when the accumulated weight of evidence in their favour, or the necessity for precise definition to meet the contradictions of heretics, seemed to demand a decision. This temper and the process in which it finds expression are well illustrated in the case of the dogma of the Immaculate Conception (q.v.) and in the authorization given to the cult of the Sacred Heart (q.v.).

This conservative spirit and extreme reverence for authority pervades the whole Roman Catholic Church in exact proportion to the degree of effective control which the see of Rome has succeeded in obtaining over its branches in various countries. To pretend to an independent judgment in questions of faith or morals is for a Roman Catholic to commit treason against his Church; and even in the wide sphere of questions lying beyond the dogmas defined as de fide a too curious discussion is discouraged, if not condemned. As opposed to the critical and analytical tendencies of the modern world, then, the Roman Catholic Church assumes the function of the champion of moral and intellectual discipline. In an attitude defined, in its extreme expression, by Pius IX.’s Syllabus of 1864 (see SYLLABUS), and the famous encyclical Pascendi of Pius X. in 1907, the development of this attitude, known—in so far as it depends on the full pretensions of the Papacy—as Ultramontanism, since the definition of the Roman Catholic Church by the council of Trent in 1564, will be found sketched in the historical section attached to this article. The earlier history, which is that of the Latin Church of the West, will be found in the articles PAPACY, CHURCH HISTORY AND REFORMATION.

Under the supreme authority of the pope the Roman Catholic Church is governed and served by an elaborate hierarchy. This, so far as its potestas ordinis is concerned, is divided into seven orders: the three “major orders” of bishops and priests, deacons, and subdeacons (bishops and priests forming two degrees of the ordo sacerdotium), and the four “minor orders” of acolytes, exorcists, readers, and door-keepers. These various orders do not derive their potestas ordinis from the pope, but from God, in virtue of their direct ministerial succession from the apostles.1 Thus sacraments administered by validly ordained or consecrated priests and bishops are regarded as valid, even when those who administer them are heretics or schismatics.

1 Thus sacraments administered by validly ordained or consecrated priests and bishops are regarded as valid, even when those who administer them are heretics or schismatics.
members of the hierarchy known as prelates (prædati), who possess this power (potestas jurisdictionis in foro externo), whether bishops or by appointment, or from diocesan or curial officials.

These jurisdictions are of very varied character, and in most cases are not peculiar to the Roman Catholic Church. They include those of patriarchs, archbishops, metropolitans, and bishops in the first rank of the hierarchy, with their subordinate officials, such as archdeacons, archpriests, deans and canons, &c., in the lower ranks. All of these will be found described under their proper headings (see also ECCLESIASTICAL JURISDICTION). The basis of the organization of the Church is territorial, the world being mapped out into dioceses or, in countries where the Roman Church is not well developed—e.g. missions in non-Christian lands—into Apostolic Vicariates. The dioceses are grouped in various ways; some are immediately dependent upon the Holy See; some are grouped in ecclesiastical provinces or metropolitanates, which in their turn are sometimes grouped together to form a patriarchate.

According to the official Gerarchia Catholica, published at Rome, there were in 1909 ten patriarchates, with fourteen patriarchal sees (including those of the Oriental rites, i.e. those Eastern communities which, though in communion with Rome, have been allowed to retain their peculiar ritual discipline). Of the four great patriarchates, three are those of Alexandria (see two patriarchates, Latin and Coptic); Antich (with four, Latin, Graeco-Melchite, Maronite and Syriac); Constantinople (Latin and Jerusalem (Latin). The lesser patriarchates are those of Babylon (Chaldaic), Cilicia, and Armenia, restoring the old (Latin, Venice (Latin) and the West Indies (Latin). (See Patriarch.)

The archiepiscopal sees number 204. Of these 21 are immediately subject to the Holy See, while those of the Latin rite having ecclesiastical provinces number 164. There are 19 of the Oriental rite: 3 with ecclesiastical provinces, viz. Armenian, Graeco-Rumanian and Graeco-Ruthenian respectively; the rest are subject to the patriarchates, viz. 2 Armenian, 3 Graeco-Melchite, 3 Syro-Chaldaic, 6 Syro-Malabar, 2 Syrian, 6 Maronite.

Of episcopal sees of the Latin rite 6 are suburbanese sees of the cardinal bishops, 85 are immediately subject to the Holy See, and 662 are suffragan sees in ecclesiastical provinces. Of those of the Oriental rites (Graeco-Ruthenian) is immediately subject to the Holy See; 9 are suffragan sees in ecclesiastical provinces, viz. 3 Graeco-Rumanian and 6 Graeco-Ruthenian; the rest are subject to the patriarchates, viz. 13 Armenian, 2 Coptic, 9 Graeco-Melchite, 5 Syriac, 9 Syro-Chaldaic, 2 Syro-Melchite.

The whole number of these residential sees, including the patriarchates, is 1023. Besides these there are 610 titular sees, formerly called see in portibus infidelium, the archbishops and bishops of which, of course, are residing in the countries to which the see is assigned to bishops appointed to Apostolic Vicariates, Vicariates and Prefectures, or to the office of coadjutor, auxiliary or administrator of a diocese. (See Archishop and Bishop.)

The dioceses are divided into parishes, variously grouped, the most usual organization being that of deaneries. In the parish the authority of the Church is brought into intimate touch with the daily life of the people. The main duties of the parish priest are to offer the sacrifice of the mass (q.v.), to hear confessions, to preach, to baptize and to administer extreme unction to the dying. It is true to say that in the "cure of souls" the confession plays a larger part in the Church than the pulpit (see Confession and Absolution). For the official costume of the various orders of clergy see the article Vesture.

The Roman Catholic Church is further divided into regular and secular. The regular clergy are those attached to religious orders and to certain congregations (see Monasticism). Of these the former are outside the normal organization of the Church, being exempt from the ordinary jurisdiction of the diocesan bishops, while the more recently formed congregations are either wholly or largely subject to episcopal authority. By far the most powerful of the religious orders are the Jesuits (q.v.). The secular clergy, on the other hand, are bound by no vows beyond those proper to their orders. Both regular and secular clergy (those at least in major orders) are under the obligation of celibacy, which, by cutting them off from the most intimate common interests of the people, has proved a most powerful disciplinary force in the hands of the popes (see Celibacy). The more complete isolation of the regular clergy, however, together with their direct relation to the Holy See, has made them, not only the more effective instruments of papal authority, but more obvious to the peoples and governments of countries where they have gained any considerable power. Their privileged position, moreover, leads everywhere to a certain amount of friction between them and the secular clergy.

In doctrine the Roman Catholic Church is divided from the orthodox communions of the East mainly by the claims of the papacy, which the Orientals reject, and the question of the "Procession of the Holy Ghost" (see Church History). From the Protestant communities which were the outcome of the Reformation the divergence is more profound, though the central dogmas of the faith are common to Roman Catholics and orthodox Protestants. The difference lies essentially in the belief held as to the means by which the truths defined in these dogmas are to be made effective for the salvation of the world. It was defined in the canons of the council of Trent, as promulgated by Pope Pius IV. in 1564, in which the main theses of the Reformers as to the character of the Church, the sufficiency of Holy Scriptures, the nature of the sacraments, and the like were finally condemned (see Trent, Council of).

The Roman Catholic Church is by far the most widespread, numerous and powerful of all the Christian communions. It is the dominant Church in the majority of European states, in South and Central America and in Mexico; it is the largest single religious body in the United States of America, while in certain Protestant countries, e.g. Prussia and the United Kingdom, it has great religious and political influence. Any statistics of its membership, however, must necessarily be misleading. Those published are generally based on the principle of deducting the Protestant from the general population of "Catholic" countries and ascribing the rest to the Roman Church. This may be possible in Germany and other countries where there is a religious census; but it is, at best, a rough-and-ready method where, as in Italy or France, besides the class of "political" or "non-practising" Catholics, large numbers of the people are more or less actively hostile to Christianity itself. (For Roman Catholic missionary work see Missions.)

The Unit or United Oriental Churches.—The overwhelming majority of the adherents of the Roman Catholic Church throughout the world belong to the Latin rite, i.e. follow the usages and traditions of the Western Church. Ever since the schism of East and West, however, it has been an ambition of the papacy to submit the Oriental Churches to its jurisdiction, and successive popes have from time to time succeeded in detaching portions of those Churches and bringing them into the obedience of the Holy See. This has only been possible owing to the temper of the Oriental mind which, while clinging tenaciously to its rites, values dogma only in so far as it is expressed in rites. The popes, then, or at least the more politic of them, have been content to lay down as the condition of reunion no more than the acceptance of the distinctive dogmas of the Roman Catholic Church, especially the supremacy and infallibility of the pope; the ritus of the Unit Oriental Churches—liturgies and liturgical languages, ecclesiastical law and discipline, marriage of priests, beards and costume, the monastic system of the Latin Church and of the Basil—have been content for the most part to leave untouched. The attempts of Pius IX. who in 1862 established the Congregatio de propaganda fide pro negotiis ritus orientalis, to interfere in a Romanising sense with the rites of the Armenians and Chaldaeans (by the bull Reserius of 1867 and Cum Ecclesiasitica of 1869) led to a schism; and Leo XIII., who more than all his predecessors interested himself in the question of reunion, reverted to and developed the wiser

1. The Latin word ritus covers not only the ordinary meaning of the modern English word “rite,” i.e. “a formal procedure or act in a religious or other solemn function,” but also “custom or practice of a formal kind,” but the sense in which it is now obsolete in England—except in the religious connotation here used—of “the general or usual custom, habit or practice of a country, people, class of persons, &c.” (New English Dict. s.v.). For the liturgies of the Latin and Oriental Churches see LITURGY.
principle of not aiming at any assimilation of rites, but only at "the full and perfect union of faith" (Encyclical Praeclarissimi). June 8, 1894. This principle had even been carried to the point of recognizing several bishoprics, growing over the adherents of various rite in the same sees; thus there are three uniat patriarchs of Antioch (Greco-Melchite, Maronite and Syriam).

Exact statistics of the membership of the Churches of the Oriental rite are almost impossible to obtain; the numbers of their adherents, moreover, are apt to vary suddenly with the shifting currents of political forces in the East, for political factors have always played a considerable part in these movements towards reunion or the reverse. In 1908 their numbers were estimated at approximately 5,500,000. The Churches of the Oriental rite fall under four main divisions: Greek, Armenian, Syrian, Coptic; and—with the exception of the Armenians—these are again subdivided according to nationality or to peculiarities of cult or language. The Churches may be further grouped according to the character of their constitution, i.e. (1) those having their own rite only in a restricted sense, since they have no hierarchy of their own but are subordinate to Latin bishops, i.e. the Greeks in Italy (Italograeci), the scattered Bulgarian Uniates, the Abyssinians, some of the Armenians and the "Christians of St Thomas"; (2) those having their own bishops and sometimes their own metropolitans, as in Austria-Hungary; (3) the Eastern patriarchates.

Geographically, the Uniat Churches may be grouped as follows:

(A) Europe, where their association with the Roman Church is at once the oldest and the most intimate.

(1) The Italograeci. These are distributed in scattered groups throughout the most of the Latin diocesan bishops, but their priests are ordained by bishops of their own rite specially appointed by the pope.

(2) The Armenian Catholic Church. With the exception of the Armenians, these are all of the Greek rite, but are divided according to nationality and ritual language into the following groups:

(a) Ruthenian Church. This, though still the most important numerically of all the Uniat Churches in Hungary, is just a Uniate Church which proclaimed its union with Rome at the synod of Brest in Lithuania in 1596, a union which, after long and bitter resistance, was admitted by the submission of the dioceses of Lemberg and Uzk in 1700 and 1702. The Church was broken up by the war of 1768, and has been more or less divided since, for those which fell to Russia were, notably under Catherine II. and Nicholas I., forcibly absorbed into the Orthodox Church. The Church, however, still numbers some 3,000,000 adherents in Galicia, and 500,000 in Bukovina. In Galicia, the Uniate Church is justly esteemed for its liturgical and ecclesiastical life, which still preserves a strong Greek influence.

(b) Ruthenian Church, which has its own metropolitan under the Greek-Catholic archbishop of Lemberg, with two suffragans: Prawski, for West Galicia, and Stanislawow for East Galicia. In Hungary there are two bishoprics, Municz and Epereges, under the head of the Patriarchate of Hungary, the archbishop of Gran. The Serbian bishopric of Kruezit in Croatia, under the Latin archbishop of Agram, may also be grouped with the Ruthenian Church, since their rite is identical. Its adherents number from 15,000 to 20,000. The liturgical language of the Uniat Church is a mixture of Olonian and Greek, and, so far as their rite is concerned, they differ from the Orthodox Slav Churches only in using the Slavonic instead of the Cyrillic alphabet. (c) Armenian Church. This number about 1,000,000 adherents and has its own organization under the metropolitan of Foska in the diocese of the Archeparchy of Shdanska, which has in the person of the bishops of Wardle and Szamov-Uvjar. It has its own ritual language since the 17th century.

(c) Armenian Church. This number in Austria-Hungary only 4000 to 5000 members. It has an archbishopric, which, having jurisdiction also over the Uniat Armenian Churches in Russia and Turkey. In Russia the Lithuanian Church (see above) ceased to exist with the liturgical language of the Uniat Church is a mixture of Olonian and Greek, and, so far as their rite is concerned, they differ from the Orthodox Slav Churches only in using the Slavonic instead of the Cyrillic alphabet. (c) Armenian Church. This number about 1,000,000 adherents and has its own organization under the metropolitan of Foska in the diocese of the Archeparchy of Shdanska, which has in the person of the bishops of Wardle and Szamov-Uvjar. It has its own ritual language since the 17th century.

(d) Armenian Church. This number in Austria-Hungary only 4000 to 5000 members. It has an archbishopric, which, having jurisdiction also over the Uniat Armenian Churches in Austria-Hungary.

(3) Uniat Churches in Russia and Turkey in Europe. (a) In Russia the Lithuanian Church (see above) ceased to exist with the liturgical language of the Uniat Church is a mixture of Olonian and Greek, and, so far as their rite is concerned, they differ from the Orthodox Slav Churches only in using the Slavonic instead of the Cyrillic alphabet. (c) Armenian Church. This number about 1,000,000 adherents and has its own organization under the metropolitan of Foska in the diocese of the Archeparchy of Shdanska, which has in the person of the bishops of Wardle and Szamov-Uvjar. It has its own ritual language since the 17th century. (d) Armenian Church. This number in Austria-Hungary only 4000 to 5000 members. It has an archbishopric, which, having jurisdiction also over the Uniat Armenian Churches in Russia and Turkey.

(4) Uniat Churches in Turkey in Europe. (a) In Russia the Lithuanian Church (see above) ceased to exist with the liturgical language of the Uniat Church is a mixture of Olonian and Greek, and, so far as their rite is concerned, they differ from the Orthodox Slav Churches only in using the Slavonic instead of the Cyrillic alphabet. (c) Armenian Church. This number about 1,000,000 adherents and has its own organization under the metropolitan of Foska in the diocese of the Archeparchy of Shdanska, which has in the person of the bishops of Wardle and Szamov-Uvjar. It has its own ritual language since the 17th century. (d) Armenian Church. This number in Austria-Hungary only 4000 to 5000 members. It has an archbishopric, which, having jurisdiction also over the Uniat Armenian Churches in Russia and Turkey.

archate of Cilicia. (b) In European Turkey the Uniat Churches are represented by tiny groups, scattered about the Balkan Peninsula, attached to Latin "missions." The movement in favour of the union of the Bulgarian Church with Rome, which grew up in 1860, was the outcome of the national opposition to the Greeks, and the establishment of the Bulgarian patriarchate in 1872 was a by-product of this movement. There are not more than 10,000 to 15,000 Uniat Bulgarians, who have been ruled since 1883 by three vicars apostolic. The Uniat Armenian and Melchites in Constantinople belong to the Eastern patriarchates.

(B) Asia and Africa.—The Uniat Churches in Asia and Africa occupy a peculiar position in so far as Rome has recognized the traditional rights of the patriarchates (see, e.g., Leo XIII.'s encyclical Praeclarissimi, 1894), and they therefore enjoy almost complete autonomy; thus the patriarchates nominate their own suffragans and have the right to summon synods for specific purposes (see PATRIARCH). Uniat Patriarchates:

(1) The Patriarchatus Italorum Armēnorum. The Armenian patriarch, whose jurisdiction embraces the Catholic Armenians in the Balkan Peninsula, in Russian Armenia and in Asiat Turkey, formerly resided in Lebanon, but has had his seat since 1887 at Constantinople. Under him are 19 dioceses, including a small one in Persia. The number of Catholic Armenians under his jurisdiction is, roughly, 100,000 (see ARME NIAN CHURCH).

(2) The three patriarchates of Antioch. (a) The Melchite (Patriarchatus Anticothos Graeco-Catholicus). The patriarch resides in the monastery of Aint-El-Trez in Lebanon, in connection over all the Uniat Greeks of all Greek nationality in the Turkish Empire, with number about 120,000. Under him are 3 archbishops and 9 bishops (see MELCHITE). (b) The Maronite (Patriarchatus Anticothos Syro-Maranitorum). The patriarch has jurisdiction over about 500,000 people (see MARONITES). (c) The Syrian (Patriarchatus Anticothos Syrum). The patriarch, who resides at Mardin near Diarbekr on the upper Tigre, is obeyed by 300,000 to 400,000 Christians. (c) The Syrian (Patriarchatus Anticothos Syrum). The patriarch, who resides at Mardin near Diarbekr on the upper Tigre, is obeyed by 300,000 to 400,000 Christians.

(3) The Chaldæans (Patriarchatus Chaldeorum Babylonis). This patriarch has jurisdiction over the Uniat Nestorian Church which numbers, roughly, about 50,000 adherents, and is divided, under the patriarchate into 11 dioceses (see NESTORIANS).

(4) The Coptic (Patriarchatus Alexanderinus Coptorum). This patriarchate was restored in 1857 by Pope Leo XIII. The patriarch, who was bom in 1895 by Pope Leo XIII. The patriarchate was restored in 1857 by Pope Leo XIII.

(5) The Uniat Abyssinian Church. This has scarcely any admiration. Such as it is there are under the authority of a vicar apostolic residing at Ker.,

(6) The Christians of St Thomas (Malabar coast). For these Leo XIII. established in 1887 three special vicariates apostolic (Vicarii apostolici Syro-Malabaronum); the vicars apostolic have the right of summoning synods according to the Syrian rite. The number of Christians of St Thomas in the obedience of Rome is said to be about 10,000. W. A. P.

The Church in Europe since the Reformation.

The term "Roman Catholic" is as old as the days of Queen Elizabeth. It is a happily chosen, for catholic means universal, and what is universal cannot be peculiar to Rome. But the term is inoffensive to Roman Catholics, since it advertises their claim that communion with the see of Rome is of the essence of Catholicity, and to Protestants, since it serves to emphasize the fact that the religion of modern Rome differs widely in many important respects from that of the undivided medieval Church. The change has brought both good and evil. Protestant controversialists have some show of reason on their side when they argue that Luther saved the Roman Church by forcing it to put an end to many intolerable abuses. On the other hand, under stress of his revolt the papacy could not but develop in a strongly anti-Protestant direction, laying exaggerated emphasis on every point he challenged. The more fiercely he denounced infallibility, the confessional, the sacramental system, the larger these bulked in the eyes of Rome.

Not that this consequence showed itself at once. The Reformation was well established before it attracted any serious attention in the 16th century. The "Romish Catholique" is as old as the days of Queen Elizabeth. It is a happily chosen, for catholic means universal, and what is universal cannot be peculiar to Rome.

1 This account of the Uniat Churches is largely condensed from the excellent article "Unierte Orientalen," by F. Kattenbusch in Herzog-Hauck Realencyklopädie (3rd ed., Leipzig, 1908), where numerous authorities are given.

2 It was officially adopted in the Relief Act of 1791 in place of the designation "Protesting Catholic Dissenters," to which the vicars apostolic objected.
notice at Rome. The popes of the Renaissance were profoundly uninterested in theology; they were far more at home in an art gallery, or in fighting to recover their influence as temporal Italian princes, gravely shattered during the long residence of the papal court at Avignon in the 14th century. But these secular interests came to an end with the so-called sack of Rome in 1527, when Charles V. turned his arms against Clement VII., and made the pope a prisoner in his own capital. Thenceforward there was no more thought of territorial aggrandisement. The popes, as the phrase went, became Spanish chaplains, with a fixed territory guaranteed to them by Spanish arms; apart from the addition of Ferrara and one or two other petty principalities on the extinction of the reigning house, its boundaries remained unchanged till Napoleonic times. Under Clement’s successor, Paul III., a new state of things began to dawn. Hitherto the way had been blocked by a horde of protonotaries, dafaries and other officials—purveyors of indulgences, dispensations and such-like spiritual favours—to whom reform spelt ruin. Even the Reformation did not move them; if less money came in from Germany, that was all the more reason for leaving things unchanged in France and Spain. But an anti-Papal movement had taken shape in Italy under the names of Morelli, Orsini, Caracciolo, Laynez, and the Englishman Reginald Pole, afterwards archbishop of Canterbury under Mary. All three were disciples of Erasmus, the great apostle of a new, tolerant, scholarly religion very different from the grimy pedantry of the medieval doctors. It was better, he said, to be weak in Duns Scotus, but strong in St. Paul—than to be crammed with all the learning of Durandus, and ignorant of the law of Christ. Men trained in this school were not likely to be tender towards vested interests in darkness, least of all when they stood in the way of a reconciliation with the Protestants: for the cardinals thought that the strength of the Reformation lay much less in the attractiveness of Luther’s doctrines than in his vigorous denunciations of the vices of the clergy. Once root out abuses with a firm hand, and they believed that a few timely concessions on points of doctrine would tempt most Protestants back within the Roman pale. This belief was shared by Charles V. Together they persuaded the unwilling pope to call a general council. It met in December, 1537, at the famous city of Trent, with Pole as one of the three presidents (see Trent, Council of).

As a means of reconciling the council was a signal failure. The Protestants refused to attend an assembly where even the most conciliatory prelate could hardly condescend to meet them on equal terms. Nor was Pole allowed to use the only possible means of overcoming their reluctance. He had wished to begin by reforming abuses before proceeding to sit in judgment on doctrinal errors. But this arrangement was cried down as a revolutionary departure from all established precedent; and he had much ado to secure the compromise that doctrines and practical reforms should be simultaneously discussed. But in the midst of its labours the council was prorogued (March 1547) in consequence of a quarrel between the pope and emperor. In 1551 it met again, only to be again prorogued in 1552. Ten years later it met again for a third and final session, lasting throughout 1562 and 1563. During those ten years great changes had taken place. Charles V. had followed Pole and his peace-loving colleagues to the grave in his place stood his son, Philip II. of Spain, while the intellectual leadership of the council fell to Jaime Laynez, general of the newly founded Society of Jesus. There was no longer any question of reconciliation with the Protestants. North Germany, England, Scandinavia were irretrievably lost to Rome; wars of religion had broken out in France. Clearly the one hope was to enter into a desperate struggle for the possession of such countries as still hung in the balance; and that could best be done by striking at the heart of the Reformation. Protestantism centred—or was by Catholics supposed to centre—in a mysterious “right of private judgment”; the council accordingly retorted by hymning the praises of obedience, of submitting to authority and never thinking for oneself. To waverers it held up an absolutely sure and unformidable Rule of Faith, contrasting impressively with the already multitudinous variations of the Protestant Churches. Moreover, thanks to Laynez, it accomplished this task without running the obvious danger of tying itself hand and foot to the past. When old-fashioned theologians talked about the canons and councils of antiquity, Laynez answered that the Church was not more infallible at one time than another; the Holy Ghost spoke through the decrees of Trent quite as plainly and directly as through the primitive Fathers. Thus the council’s authority became at once peremptory and elastic. But the real gainer was the pope. Hitherto infallibility had been thought of as the supreme weapon of the Church’s armory, destined only for use at some extraordinary crisis; hence it was naturally conceived of as residing only in the extraordinary authority of a general council; stronger and stronger grew the tendency to ascribe infallibility to the pope alone, as being always on the spot.

Doctrine and discipline once settled at Trent, the work of counter-reformation could begin. Rebels were won back by force wherever force could be applied. In Spain the Inquisition soon sniffed out the few Reformers. In Italy, though declared Protestants were few, there was widespread sympathy with some of Luther’s ideas; a committee of cardinals at Rome was accordingly organized into an Inquisition, with branches at the chief Italian towns. For half a century trials were many at Venice and elsewhere, but actual executions were only common at Rome; the most illustrious victim was the philosopher Giordano Bruno, burnt in 1600. In the imperial dominions, however, there could be no recourse to the stake. The peace of Augsburg (1555) forbade the German princes to persecute, though it recognized their right to determine to what religion their subjects should belong, and to banish nonconformists. At first this compromise had worked in favour of the Reformation, but presently the Catholic princes began to turn it against their Protestant neighbours. "The Government of the commonwealth," the Protestants were told, "Governs them wisely, depriving them of church and school, of master and schoolmaster; and by those nameless arts with which the rich used to coerce the poor in the good old days. Fervent preachers came amongst them, widely differing in morality, education, earnestness and eloquence from the parish clergy, whose deficiencies gave such succour to Luther. Most of those who, having no taste for controversy, were repelled by scandals were easily reconciled. Others, who were conscious of disagreement with the theology of the last thousand years, had now to meet disputants of a more serious type than the adversaries of Luther, and to meet them unsupported by experts of their own. Therefore it was by honest conviction, as well as by calculated but not illegal coercion, that the Reformation was driven back.” (Acton, Lectures on Modern History, p. 123.)

This system was not an unmixed success; for its extension to Bohemia early in the 17th century brought about the Thirty Years’ War. But it obliged the authorities to pay anew attention to the training of the clergy. The “seminary system” came into being—that is, the custom of obliterating candidates for ordination to spend several years in a theological college, whence lay influences were carefully excluded. But ecclesiastical learning of a wider type was also promoted. Gregory XIII. (1572-85) and Sixtus V. (1585-90) dreamed of making Rome once more the capital of European culture. Gregory reformed the Calendar, and founded the university that bears his name. Five years of power were enough for Sixtus to reform the central government of the Church and the administration of the Papal States, to set on foot the Vatican press and issue an official edition of the Vulgate. Their efforts bore fruit in many quarters. In Rome arose Cardinal Baronius, first of...
modern Church historians; Spain produced Suarez, most philosophical of divines. A generation later the French Oratory became the home of Malebranche and of Richard Simon, father of Biblical criticism. Mabillon and his Benedictines of Saint-Maur paved the way for the systematic investigation of historical records. The Flemish Jesuit Bolland brought the light of criticism to bear on the legends of the saints (see Bollandists). His French colleague, Petrai, better known under his latinized surname of Petavious, opened still wider floodgates when he taught that theological dogmas, like everything else, have a history. Lastly, the Jansenist “hermitage” at Port Royal contributed the historian Tillemont, whose bigotry Edward Gibbon declares to be overbalanced by his erudition, veracity and scrupulous minuteness. Other such communities and “congregations”—semi-monastic bodies standing in closer touch with the world than did the medieval orders—undertook the diffusion of knowledge. Wherever they went the Jesuits opened grammar-schools, which had the double advantage of being excellent and cheap. An Italian sisterhood, the Ursulines, was founded for the higher instruction of girls; late in the 17th century a French priest started the Christian Brothers, pioneers of elementary education. Other communities again devoted themselves to parochial work. Such were the Oratorians of St Philip Neri, founded to evangelize the middle classes of Rome. Such, again, were the Lazarists of St Vincent de Paul, whose duty was to preach in neglected country districts. But the most interesting of all these new foundations was the Sisters of Charity, also founded by St Vincent de Paul. This admirable body represents a significant departure from medieval ideals. The old-fashioned nun had spent her time behind high walls in prayerful contemplation; the one object of the Sister of Charity was the service of her neighbour.

Not that all medieval ideas were by any means dead; they never burned more brightly than in the Spain of St Teresa (1515-82). Her first idea had been to combat alike the heresies and the worldliness of her time by a return to the austerities of a more heroic age. With this object she founded her order of “Discalced” or barefooted Carmelites; it presently became the refuge of Louise de la Vallière and many another penitent of rank. But mere bodily rigours were not enough for Teresa; she felt the need of raising to a state of complete detachment from all earthly interests and ties. Her whole theology centres in the lines—

"The love of God flows just as much from our weakness as from our strength. Our hands, their strength is such, Bear not the conflict of these rival tides."

How, then, subdue the rivalry? Teresa turned to the mystical writers, and learnt from them how to root out the last relics of self-love from the mind by a long discipline of mystical trance and “contemplation.” These ideas, in a very modified form, were introduced into France by the great devotional writer, St Francis of Sales; in the latter half of the 17th century they were pushed to the extravagant length known as Quietism by Fénelon, and especially by Madame Guyon and Michel de Molinos. Meanwhile, the leading conception from which St Teresa started had developed along characteristically different lines in the mind of her compatriot and contemporary, Ignatius Loyola. He quite agreed that self-will was the enemy; but there was no quicker way of checking it than an interminable course of ecstasies and austerities? The thoughts of the converted soldier flew back to the military virtue of obedience. In the long-run no self-imposed hardships could prove quite as disagreeable as always being under the orders of some one else. Obedience accordingly became the typical virtue of Jesuit’s soul (see Jesuits). The individual Jesuit obeyed his superior, who obeyed the rector, who obeyed the provincial, who obeyed the general, who obeyed the pope, who took his orders straight from God Almighty. Such a theory was of untold practical value to the Church of Rome, more especially during the era of the Reformation. Laynez at the council of Trent has given one signal instance of its working, but its operations were by no means confined to the central field of the dogma. If men were really to be made obedient, it could only be by stopping them from thinking for themselves about the everyday problems of conduct; and the best way to do this was to furnish them beforehand with a ready-made code of answers to such problems, warranted to meet all needs. Hence casuistry and the confessional loomed large on the Jesuit horizon. The casuist’s duty was to apply the general precepts of the Church to particular cases. He explained, for instance, when a man was strictly bound to tell the truth; when he might avail himself of the mild licence of an equivocation; and when the Church placed at his service the greater indulgence of a mental reservation. The confessor brought the casuist’s principles to bear on the conscience of his penitents, and thus saved them from the danger of acting on their own responsibility (see Casuistry).

In its origin this system was a perfectly honest attempt to widen the sphere of obedience by making morality wholly objective and independent of the vagaries of the individual conscience. But what was begun in the interest of obedience was carried on in those of laxity. Experts proverbially differ, and the casuists were no exceptions to the rule. But when great authorities change to various, ill it became an average proportion of them to decide. When in the 17th century, was must have some solid reasons behind it—alia niti probabilitas—and humble lay-folk could act upon it without a twinge of conscience. Thus arose lax casuists of the type of Antonio Escofar (1580-1669), the central figure of Pascal’s Provincial Letters. Their whole business was to hunt through the older authorities in search of “benign” decisions. Their temptation is easy to understand. Half Europe was full of wavers between Protestantism and Catholicism tolerably certain to decide for the Church that offered them the cheapest terms of salvation; and even in wholly Catholic countries, many, especially of the upper class, might easily be scared away from the confessional by severity. Thereby their money and influence would be lost to the Church, and their souls robbed of the priceless benefit of priestly absolution. On the other hand, these “Escobarine morals” by no means passed unchallenged; ever since the foundation of the society the aims and methods of the Jesuits had called forth lively opposition in many parts of Catholic Europe, and not least in Loyola’s native land of Spain. But the most effective protest against the Jesuits began when Michel de Bay, a professor at the Flemish university of Louvain, put forward certain theories on grace and free-will in the latter part of the 16th century. In 1540 a much more elaborate statement of the same ideas appeared in a posthumous treatise on the theology of St Augustine from the pen of Cornelius Jansen, also a Louvain professor (see Jansenism). Into the technical detail of the controversy there is no need to enter. It is enough to say that two rival doctrines of grace and free-will were struggling for mastery in the Roman Church. One theory emphasized the necessity of grace; having been put together by St Thomas Aquinas, it was known as Thomism, and was especially championed by the Dominicans. The other laid the chief stress on free-will; it was known as Molinism from its inventor, the Jesuit Louis de Molina, and was in great favour with the society. The two orders came into violent collision at Rome between 1588 and 1666. But the quarrel, known as the controversy de auxilis gratae, was brought to an end by Pope Paul V., who closed the debates and adjourned its decision sine die.

At first sight this abstract question seemed endlessly remote from the practical policy of Escobar; really there is a close connexion between the two. The whole system of the Jesuits rested on a basis of free-will. Their quarry was the average man; and the best way of impressing the average man is to set before him duties that he feels himself fully capable of performing. Then he will really feel morally responsible if he leaves them undone, hence the necessity of free-will. On
the other hand, as Jansen pointed out, free-will tends to make
the average man's estimate of his own powers into the supreme
criterion of all that is good and right. God must perforce be
satisfied with whatever common sense thinks it fair and
reasonable that He should expect. Jansen accordingly de-
nounced free-will as dishonouring to God, and destructive of
the higher interests of morality. But, if men threw over
common sense, what was to be their guide in life? Jansen
answered with his doctrine of Irresistible Grace. This was
simply a cumbersome way of saying that God awakens in the
righteous heart an intuitive faculty of discerning right from
wrong. "This holy taste or relish," says a follower of Jansen,
"distinguishes between good and evil without being at the
trouble of a train of reasoning; just as the nature and tendency
of a heavy body, let fall from a height, shows the way to the
centre of the earth more exactly in a moment than the ablest
mathematician could determine by his most accurate observa-
tions in a whole day." That being so, the Jansenists obeyed
his Inner Light, and paid little heed to the earth-bound
standards of unregenerate common sense. Nor was he much
more respectful towards the official standards of the Church.
Why should he consult a casuist rather than his Inner Light?
Thus the Jesuits saw themselves menaced by a grave revolt.
What would become of the confessional if penitents were
allowed to act on what they fondly took to be a heaven-sent
inspiration? In a twinkling they would be off to some spiritu-
ial Wonderland, where no confessor could bring them to
book. On the other hand, only preach to them a strong
doctrine of free-will, and all these dangers vanished. They
would feel bound to disregard their sporadic intuitions, and
act only for reasons that would be clearly set out in black and
white. Their past performances could then be checked, and
their future actions forecast by the priest; and there
was small danger of their straying beyond the limits marked
out by authority.
Thus within the spiritual sphere free-will led up to Jesuit
obedience. But in the secular world this paradox failed to
obtain; there free-will was only too ready to come into
conflict with the Church. The 15th and 16th centuries had
seen the final break-up of the medieval system of reverence
for authority and tradition. In art and learning, morals and
government, the old walls came crashing down; in the general
bankruptcy of authority men were forced to depend on them-
seves. And the contemporaries of Machiavelli soon learned
to take the fullest advantage of this liberty to pursue their
own best interests in the way that pleased them best. But
if individuals might be guided by self-interest, why should
that principle be denied to associations of men? On the
ruins of a medieval Christendom, hierarchically
organized under the pope, grew up the "new mon-
archy," or modern state, owning no law but its
own will. Yet the popes laid aside none of their
medieval claims, or even their traditional weapons.
In 1606 Paul V. laid Venice under an interdict, on the
ground that the republic had infringed the immunities of the
clergy; the doge replied by threatening with death any one
who took any notice of the papal thunders. Thenceforward
the thunders continued chiefly on paper. In 1625 Catholic
Europe was scandalized by the De Schismate of the Jesuit
Santarelli, in which he claimed for the pope an absolute
right to interfere in the concerns of secular princes, whenever
he chose to declare that the interests of religion were in any
way concerned. He could dictate their policy at home and
abroad, revise their statute-book, upset the decisions of their
law-courts. If they refused to listen he could punish them in
any manner he thought fit; in the last resort he could
release their subjects from allegiance and head a crusade of
Catholic powers against them. These pretensions roused a
special burst of indignation in France. There, on the divisions
of the wars of religion, had followed an irresistible reaction
towards patriotism and national unity. France had suddenly
grown to her full stature; like the contemporary England
of John Milton, she was become a "noble and puissant nation,
rousing herself like a strong man after sleep." Even the
clergy were swept away by the current, and meant to be
patriots like every one else. "Before my ordination," said
the eminent theologian Edmond Richer, "I was a subject of
the king of France: why should that ceremony make me a
subject of the pope?" Subjection to the pope implied an
Italianization of French religion; and most Frenchmen looked
on the Italians as an inferior race. Why, then, should the
right have a chance to decide ecclesiastical disputes be taken away
from their own highly competent fellow-countrymen, and reserved
for a set of incapable judges in a foreign land? Germany and
Spain might let themselves be bittered and bridled if they
chose, but for centuries France had prided herself that, thanks
to her Gallican liberties, she stood on a different footing towards
Rome.
The Liberties in question were certain ancient rights, whose
origin was lost in the mists of time. One forbade papal bulls
to be published in France without the consent of the
Pope. Another exempted French subjects from
Gallicanism.
the jurisdiction of the Inquisition and other Roman
tribunals—such as the Index of Prohibited Books. In the
17th century such immunities were all the more valuable since
French statesmen found themselves in an awkward position.
The great aim of Henry IV. and Richelieu was to exalt France
at the expense of Vienna and Madrid. But Madrid and Vienna
were the official champions of the papacy; hence to make
war on them was indirectly to make war on the pope. This was
enough to trouble the consciences of many excellent men;
and it became necessary to devise a compromise that should
set their minds at rest, by showing them that they could be
at once good citizens and good Catholics. This compromise
is known as Gallicanism. In the hands of Bossuet and other
eminent divines it was developed along both theological and
political lines. Theological Gallicanism refused to recognize
papal decisions on questions of doctrine, until they had been
ratified by the bishops of France. Political Gallicanism main-
tained that lawful sovereigns held their power directly of God,
and not meditately through the pope. Hence no amount of
misgovernment, or neglect of Catholic interests, could justify
Rome in interfering with them. In other words, Bossuet only
answered Santarelli by setting up the divine right of kings.
However, this dogma by no means scandalized the subjects of
Louis XIV., for the worship of the sovereign was one of their
most cherished instincts. And Louis's ecclesiastical policy
flattered their national pride. He introduced no theological
reforms. All he did was to insist, in matters of administra-
tion, he would be master in his own house. He supported
pope and bishops so long as they took their marching orders
from him. If they refused he was perfectly ready to make war
on the one and send the others to the Bastille. It is eminently
characteristic of his methods that, just at the same time as
he was turning loose dragons on his Protestant subjects after
the revocation of the edict of Nantes (1685), he was employing
other dragons to invade the papal territory at Avignon,
to punish Innocent XI. for having refused institution to some
of his nominees to bishoprics.

The revocation of the edict of Nantes owes quite as much
to the dream of political absolutism, inherited from Richelieu,
as to religious bigotry. In the words of Saint-Simon, the
Huguenots were "a sect that had become a state within the
state, dependent on the king no more than it chose, and ready
with the slightest pretext to embroil the whole country by an
appeal to arms." So long as they were powerful, the crown
did treat with them; but when once their power began to
dwindle, it was certain that the crown would crush them. But
during Louis's latter years, when the War of the Spanish
Succession had brought a rain of disasters thickly upon him,
bigotry got the upper hand. The broken old man became
feverishly anxious to propitiate offended Heaven, and
himself another Blenheim or Malplaquet, by exterminating
the enemies of the Church. And his Jesuit confessors had no doubt

ROMAN CATHOLIC CHURCH
that the first and foremost of those enemies were the Jansenists. Not only did their doctrine of grace defy the favourite Jesuit principle of obedience to authority, but it bade fair to set aside the whole Catholic machinery of infallibility and sacraments. If God spoke directly to the individual conscience, what was the use of intermediaries? Led by his Jesuits, Louis wronged the unwilling Clement XI, the Bull Unigenitus (1713), which was intended to deprive believers in individual inspiration of all possible foothold within the Roman Church. The bull caused a violent uproar. Fénelon, although personally an admirer, admits that public opinion credited it with "condemning St Augustine, St Paul, and even Jesus Christ"; and the few Jansenist bishops appealed and "re-appealed" against it. But the government was inexorable; in 1730 the Unigenitus became part and parcel of the law of the land. Still, to make a law is one thing; to get it administered is quite another. The parlement of Paris was a strongly Gallican body, and had many grievances to avenge on Louis XV. and his ministers. To annoy them, it put every possible difficulty in the way of an execution of the bull. Under the fostering care of the judges, a belief sprung up that to call oneself a "Jansenist," and oppose the Unigenitus, was to show oneself a lover of civil and religious liberty. This feeling was intensified by the conviction that the bull struck against the liberty of the press, and the authority of the Roman Church, as befit the great exponent of authority and the keeper of the consciences of many kings, had always been on the side of political autocracy; and therefore it became increasingly unpopular, when once the tide of French intelligence began to set in the direction of revolutionary reform. Nor were the Jesuits in much better odour among other nations. Their perpetual meddling in politics, and even in speculation and finance, stank in the nostrils of every government in Europe; while their high-handedness and corporate greed in the matter of ecclesiastical privileges and patronage alienated the clergy. Their reform was more than once discussed; and death alone prevented Benedict XIV. (1740-58), the most remarkable of the 18th-century popes, from taking some very stringent measures. A year after Benedict's death the first blow fell. Pombal, the great reforming minister in Portugal, expelled them from that country on a charge of having conspired against the life of the king. Two years later the Paris parlement had its chance. Leibniz, the philosopher-statesman, the Marquis of Huygens, had set up as a West-India merchant on a large scale. His enterprises were unsuccessful; in 1761 he became insolvent, and the Society refused to be responsible for his debts. The French courts made the consequent bankruptcy proceedings the excuse for a general inquiry into the Society's constitution, and ended by declaring its existence illegal in France, on the ground that its members were pledged to absolute obedience to a foreigner in Rome. Louis XV. now proposed that the French Jesuits should be placed under some special organization, less obnoxious to his parlement. The general only made the famous reply: "Sint ut sunt, aut non sint." Thereupon Louis let the judges have their way. In 1762 the Society was suppressed in France; in 1767 it was also declared illegal by Spain, Naples and other Italian powers. Pressure was now put on Clement XIII. to dissolve the Society altogether. He refused; but his successor, Clement XIV., was more pliable, and in 1773 the Jesuits ceased to be.

In France the philosophes and the quarrels over the Unigenitus had whetted the spirit of religion; nor was the Christianity of other countries at a much higher ebb. Spain was utterly dumb; Italian fervour could only boast the foundation of two small orders of popular preachers—the Passionists (1737), and the Redemptorists, instituted in 1732 by St Alfonso Liguori (q.v.), who also won for himself a dubious reputation on the unsavoury field of casuistry. German Catholicism was still in a very raw, unsophisticated state. It is characteristic that, while Paris had its Bossuet*, and Bourdaloues, Vienna was listening to Abraham a Sancta Clara, the punning Capuchin

whom Schiller, regardless of dates, introduces into the opening scene of his Wallenstein. However, from Germany was to come a serious attempt at reform. There the vision of a reunion with the Protestants had haunted many Catholic brains ever since Bossuet and Leibniz had corresponded on the subject. Faithful to the ancient tradition of Contarini and Pole at Trent, these good men persisted in supposing that the Reformation was nothing more than a protest against practical abuses: remove the abuses, and the rest would follow of itself. And, inasmuch as they held that most abuses were due to the slipperiness and procrastinating greed of Roman officials, the first step should be ruthlessly to curtail the power of Rome and extend that of local Churches. Such was the theme of a book, De statu Ecclesiae, ad reuinueos disidentes in religione Christianos compositus, published by one Justinus Febronius in 1763. The author was Johann Nikolaus von Honthheim (q.v.), suffragan in partibus to the elector-archbishop of Treves. Honthheim's theories could not but prove attractive to the local Churches, more especially when they were governed by bishops who were also temporal great lords. The three ecclesiastical electors and the prince-archbishop of Salzburg met in congress at Ems in 1786, and embodied Honthheim's proposals, though in a very modified form, in a document known to the public at once as the constitution of Emser (see FEBRONIUM). Meanwhile, their overlord, the emperor Joseph II. 1786-90, was dealing with the question of a much more radical spirit, and actually abolishing abuses wholesale. The reign of "Brother Sacristan," the nickname given to Joseph by Frederick the Great, was one continual suppression of superfluous abbeys, feast-days, pilgrimages. More dignified was his attempts to broaden the minds of the clergy. Instead of being brought up in diocesan seminaries, centres of provincial narrowness, candidates for ordination were to be collected into a few large colleges set up in university towns. Still, Joseph only touched the surface; his brother, the grand-duke Leopold of Tuscany, aspired to cut deeper, and provoke a religious revival on the lines of Jansenism. His plans, which made a great stir at the time, were outlined at a synod held at Pistoia in 1786 (see PISTOIA, SYNOD OF).

Three years later, however, the world had more important things to think of than Leopold's ecclesiastical reforms. At first the French Revolution was by no means anti-Catholic—though the Constituent Assembly remembers its first work to be the abolition of the Roman Catholic Church; not to be bitterly hostile to Rome—and its great aim was to turn the French Church into a purely national body. Hence it decreed the "civil constitution of the clergy." Bishops and rectors were made elective, with salaries paid by the state; and all priests were required to take an oath of fidelity to the government: those who refused the oath rendered themselves liable to banishment. Three years later the triumph of the Jacobins brought with it the "abolition of Christianity," and a spell of violent persecution, which gradually slackened under the Directory (1795-99). In 1799 Napoleon became First Consul, and at once set himself to deal with the ecclesiastical problem. There must clearly be a Church, and the small success of the Civil Constitution made clear that public opinion would not put up with a Church practically detached from Rome. On the other hand, Napoleon quite agreed with Louis XIV. in wishing to be master in his own house, and to turn the clergy into a supplementary police. Accordingly, in 1801 he negotiated with Pius VII. a Concordat, which remained in force for thirty years. The spirit of the old law was to pay the bishops and parochial clergy; it was to directly to appoint the one, and to have a veto on the appointment of the other. But for the religious orders no provision was made; and Napoleon refused to tolerate the presence of unordained clerics on whom the government had no hold. When his fall brought about the restoration of Louis XVIII. (1815), this restriction was relaxed, and the "congregations" returned in large numbers to France. But the Bourbon government had no intention of encouraging them
too much; it clung as closely as Napoleon himself to the idea of a State Church, taking its orders from the government. In the story of Gallicanism, which had once stood for all that was national and progressive, now came to mean subservience to a feeble autonomy already tottering to its fall. "A free Church in a free State" became the motto of the group of brilliant men, led by Lamennais, Montalembert and Lacordaire, who started up as soon as the July Revolution of 1830 replaced Charles X. by Louis Philippe. They felt that Catholicism was strong enough to stand alone, without artificial support. For the Revolution had not "abolished Christianity," even among the educated classes, quite so thoroughly as it imagined. Many were only kept back from going to church by the fear that their neighbours would think them superstitious or narrow-minded. But in 1802 Chateaubriand had published his epoch-making Génie du Christianisme, in which he declared that of all religions Christianity was "the most poetical, the most human, the most favourable to freedom, art and letters." If that were so, no one need be ashamed to profess it; and the younger generation of Frenchmen began to gravitate back to the Church. Meanwhile, Germany was being profoundly influenced by the great religious revival known as the Romantic Movement, which began with the worship of medieval art and literature, and ended with the worship of medieval religion. And even Italy and Spain presently began to play their part in the Christian reaction. Rosmini in one country, and Balmes in the other, "brought piety to the learned, and learning to the pious."

These writers, however, only touched the few; and the great aim of Lamennais and his friends was to reach the mass of the people. Immediately after the accession of Louis Philippe they started their famous newspaper, L'Avenir, hoping thereby to reconcile the Church with democracy, and make the pope the leader of the party of progress. The enterprise was hazardous, since democracy had hitherto brought nothing but ill to Rome. In 1798 French troops had entered the papal states, proclaimed a republic in Rome, and kept Pius VI. a prisoner till his death (1799). In 1808 Napoleon arrested his successor, Pius VII., threw the papal states into the hands of his kingdom, and dragged Pius about from prison to prison till the eve of his own fall in 1814. When the congress of Vienna gave the pope back his dominions, the one thought of the broken old man was to restore, as far as possible, the ancient order of things. But the traditional methods of Roman administration were deplorably ineffective; on the accession of Gregory XVI. (1831-46), the powers presented a memorandum strongly urging reform. Some reforms of detail were introduced; but Gregory declared that to grant a constitution to the States of the Church would be incompatible with the principle of the papacy. Such a man was hardly likely to listen to the plans of Lamennais. In 1832 the Avenir was suppressed, and the disgusted Lamennais left the Roman Church. Lacordaire and Montalembert, however, continued their democratic campaign, by no means without success; for the revolution of 1848, which drove Louis Philippe from the throne, was far less hostile to Catholicism than that of 1830. Under the short-lived Second Republic (1848-52) the position of the Church grew even stronger, for the introduction of universal suffrage brought to the polls great masses of new voters strongly clerical in sympathies. In 1850 was passed the Loi Fauxoux, which broke down the Napoleonic idea of a state-monopoly of teaching, and allowed the opening of voluntary schools. Of this concession the religious orders took full advantage. Meanwhile in Rome things had gone from bad to worse. Gregory XVI.'s refusal to grant a constitution called forth a series of sporadic outbursts, inspired by Mazzini and the "Young Italian" party, between 1832 and 1838. These were put down by French and Austrian arms, with the result of focusing the hatred of Young Italy on the pope. One last attempt was made to save him. In 1843 the Piedmontese priest Gioberti brought out a remarkable book, in which he urged his countrymen to combine into an Italian federation with the pope at its head. For a moment it seemed as though Gioberti's dream was about to translate itself into reality. In 1846 Gregory died, and was succeeded by Pius IX., one of the youngest of the cardinals, and well known for his popular sympathies. He at once granted an amnesty to political prisoners, of whom the Roman gaols were full; two years later (March 1848) he issued a constitution to the papal states, and seemed about to throw in his lot with the forces making for Italian independence. But the first step thereto was deliverance from the Austrian yoke; and Pius, the Italian prince, was grievously hampered by his position as head of the Church. How could a pope make war on Austria, the one power that had never faltered in its allegiance to the Church? Accordingly Pius soon drew back, and his popularity waned. In the autumn the revolutionary fever, which had swept through all Europe earlier in the year, spread to Rome. The pope's prime minister, Count Rossi, was murdered, and Pius himself, escaping to Gaeta, threw himself under Neapolitan protection. In Rome Mazzini proclaimed a republic. Once more France and Austria were arrayed against each other. In 1859 Pius, soon back to Rome, and ruled there under the shadow of foreign bayonets. The Papal or Second Republic had come to an end in France; in 1852 the prince-pope, Louis Napoleon, was elected emperor. At first he greatly needed the support of the clergy to secure him on his precarious throne. But, as he grew stronger, his desire for their good opinion paled before an overmastering propensity to meddle in the affairs of foreign nations. He allied himself with Victor Emmanuel, and marched into Italy in 1859, with the object of expelling the Austrians from the peninsula. This expedition led directly up to the unification of Italy. Two years later Victor Emmanuel was master of the whole country, except Venice and the "Patrimony of St Peter." This last—about one-third of the papal states—was all that was left to Pius; and even this was only held for him by French troops. When Napoleon withdrew his garrison in 1866, Garibaldi immediately raised a body of volunteers to march on Rome; and Napoleon was obliged to send back his troops. Three years later, in the climax of the Franco-Prussian War (July 1870) led to their recall. In the following September, ten days after the final collapse of Louis Napoleon at Sedan, the troops of Victor Emmanuel entered Rome; and the temporal power of Pius came to an end. Pius might no longer rule over the papal states; but there was consolation in the thought that, within the realm of conscience, his power had increased by leaps and bounds. The whole history of the 19th century is one vast conspiracy to exalt the importance of the papacy. At its opening both the intellectual and administrative guidance of the Church was entirely in French and Italian hands; and the first instincts of those countries is to lean on an all-sufficing government. The French Revolution had supposed itself to be fighting for the "rights of man"; really it was trying to replace an autocratic kingship by an equally autocratic "general will" of the multitude. And it failed because no general will could make its voice heard in the face of particular inclinations. Thankfully did men bow before Napoleon, who undertook to relieve them of the responsibility of having to make up their minds. Nor did the emperor's fall by any means entail the fall of his ideas; Count Joseph de Maistre, the great orator of ultramontanism, did little more than transplant them on to the ecclesiastical domain. Bossuet and the old-fashioned divines had believed in an elaborate system of checks and balances—popes, councils, bishops, temporal sovereigns each limiting and controlling the other—just as Montesquieu and Alexander Hamilton had believed in a careful separation of the executive from the legislative power. Napoleon swept away the checks and balances, and made the will of a single man the one and only sanction of government. In like manner de Maistre proposed to sweep away the ecclesiastical checks and balances, and vest the whole of the Church's authority in
Rome and the "His- 
torical School."
together with a Syllabus of eighty of the most important "errors of our time" (see SYLLABUS). These two documents caused an excitement nowadays hard to understand. Apart from some fulminations against such modern pests as freemasonry, communism, science, and "so-called Bible societies, heretical-societies," the Syllabus says nothing that the papacy had not been saying for hundreds of years. It is its real object is to attack such professedly Catholic governments as have fallen in with modern ideas—as for instance, by allowing freedom of worship to their Protestant subjects, or by refusing to punish brawling in Catholic churches more severely than other breaches of the peace.

In other words, Pius utterly rejected the whole principle of toleration, and declared that the Church would still impose itself by force, whenever it got the chance to do so. However, any hopes he may have had of finding another Philip II. were soon dashed to the ground. Eighteen months after the publication of the Syllabus broke out the Austro-Prussian War (June 1866), when the one faithful ally of Rome was trampled under the feet of the arch-Protestant Hohenzollerns. But the pope's spirit was not broken. If he could not lord it over one sphere, at least he could be master in another. In 1869 he summoned a general council at the Vatican, avowedly for the purpose of getting it to declare his personal infallibility. For although the old rivalry between pope and council had long ago been practically settled in favour of the pope, no council had yet formally acknowledged its defeat. In 1870, many prominent French and German divines still denied papal infallibility altogether; and Louis Napoleon had regularly fallen back on Richardos's old device of stirring up the embers of Gallicanism, whenever the French clergy grew restive about his alliance with Victor Emmanuel. And even the more moderate believers in the pope's infallibility maintained that it was merely negative, a heaven-sent immunity against falling into error. But Pius and his immediate circle argued that this was not enough. The great need of the age was authority; and authority was most likely to strike the imagination of the faithful if it found a vivid concrete embodiment in the person of the pope. He must not simply be immune from error; truth must stream down on his head from heaven, and on his head alone. "We all know only one thing for certain," wrote the great Catholic pamphlet, Louis Veuillot: "that is, that no one knows anything, except the man with whom God is for ever, the man who carries the thoughts of God." But this view was too extreme for the council; the most Pius could hope for was to be declared immune from error, instead of positively inspired. Even this negative infallibility was stoutly contested by the French and German bishops during the eight months that the council lasted (December 1869 to July 1870). But they were richer in talents than numbers: out of six hundred bishops, they only commanded eighty votes. Most left Rome before the final session; only two—one from Naples, one from the United States—continued their protest up to the end. On the 18th of July the pope's decrees were declared "irrefutable of themselves, irrespectively of the consent of the Church," always provided that they dealt with doctrines of faith and morals, and were delivered _ex cathedra—that is, with the intention of binding the consciences of all Catholics. These limitations were the work of the moderate infallibilists, but the real hero of the day was Pius. Theologians might draw their fine-spun distinctions between realms where the pope was actually infallible and realms where he was not; but Pius knew well that loyal Catholic common sense would brush their technicalities aside and hold that on any conceivable question the pope was fifty times more likely to be right than any one else (see VATICAN COUNCIL AND INFAILLIBILITY).

So absolute became the papal sovereignty over conscience that more than one government took alarm. While the council was still sitting the Bavarian minister, Prince Chlodwig zu Hohenlohe-Schillingsfurst, suggested to Bismarck that the Powers would do well to bring its deliberations to an end; and immediately after the publication of its decrees Austria notified the pope that so vast an extension of the Church's claims would necessitate a revision of the concordat. And when the communication of Döllinger and other anti-infallibilist divines (1871) led to the declaration of an indestructible Old Catholic Church (see OLD CATHOLIC, Bavaria), Switzerland and other countries gave it a warm welcome. So also did Berlin. The new German empire, consolidated through wars with Catholic Germany and Catholic France, was of all countries least likely to tolerate Roman attempts to dictate to its subjects. Tension was increased by the fact that the Centre, or Catholic, party in the Reichstag was led by Windhorst, formerly prime minister to the dispossessed king of Hanover, and thus naturally became identified with the opposition of the smaller German states to the supremacy of Prussia. The quarrel began in 1871 when the Prussian government supported some teachers in state-aided Catholic schools whom the bishops wished to dismiss on account of their anti-infallibilist opinions. A year later, under the ministry of Falk, it developed into what the great scientist, Rudolf Virchow, called a _Kulturkampf_, or conflict of civilizations. The famous May laws (1873) were a determined attempt to bring the literary education, appointment and discipline of the clergy under state control, and to regulate the use of such spiritual penalties as deprivation and excommunication. When the bishops refused to obey, Falk fell back on force. The Jesuits were banished from the German Empire, and most of the other orders from Prussia. The archbishops of Gnesen and Cologne and many minor dignitaries were imprisoned (1874); and the so-called "Bread-basket Law" was passed to coerce the parish clergy by suspending the salaries of the disobedient. The result of these severities was exactly the opposite of what Falk intended. He had meant only to top off a few ultramontane extremists; he succeeded in sending Catholics of every shade and colour pell-mell into the arms of Rome. And the effect remained long after the cause had died away. On the death of Pius IX. (February 1878) his successor, Leo XIII., at once showed himself willing to come to terms. Negotiations were long and difficult; for Bismarck would not abolish the May laws outright, and Leo had much ado to hold in check the zeal of the Vatican. But Falk retired in 1879; various mutual concessions were made which led to a gradual abrogation of the May laws. Yet—thanks to its organization, its press, and the elaborate network of alliances spun by Windhorst—the Ultramontane Centre still remains a powerful force in German politics.

This conciliatory policy towards Berlin was the first-fruits of a new régime; Leo XIII. was in every way a complete contrast to Pius IX. Pius had fed on inspirations; Leo was a man of calm, deliberate judgment, little likely to go to the prompting of his _monsignori_. He was a polished scholar of the old-fashioned type; early in his reign he threw open the Vatican Archives to the students of the world. Having spent his youth in the papal diplomatic service—he was nuncio at Brussels from 1843-46—he had a certain knowledge of the workings of parliamentary institutions, while the years immediately before his accession had been spent as archbishop of Perugia, so that he was not closely identified with any of the Vatican parties. The results of a change of master were soon seen. Pius IX. had died at war with almost every country in Europe. He had quarrelled with Austria; Russia was persecuting its Catholic subjects; France was under the spell of Gambetta and his doctrine that clericalism was the enemy; Spain and Belgium followed France; even Switzerland was waging a _Kulturkampf_ on a small scale. In a few years Leo had made peace with Austria, pacified Switzerland and Belgium, opened up negotiations with Russia; while his elevation of Newman to the cardinalate (1879) made a great impression in Great Britain. About 1886 hopes even ran high that he was on the eve of a reconciliation with King Humbert at the Quirinal. These hopes were vain. Leo was absolutely convinced that a territorial sovereignty was required to
ensure the moral independence of the papacy; and he believed
that the new Italian kingdom was a mushroom growth, that
might fall in pieces at any moment. Hence he followed in the
steps of Pius IX. and refused to recognize the existence of the
de facto government in any way whatever; he would not
accept the subsidies it offered him, or allow Catholics to take
any part in political life. During the earlier years of his reign
he undoubtedly had hopes of recovering his lost dominions
with the help of Germany, and Bismarck was not the man to
discourage such expectations. They were suddenly blasted
when Germany, Italy and Austria entered into a Triple
Alliance at the end of 1887. Theretofore Leo turned to France. Already
in 1884 he had warned the French clergy against meddling in
royalist intrigues; in 1892 he issued a much more stringent
exhortation to French Catholics to rally to the Republic.
An idea got abroad that he was looking to the time when the
old dream of Lamennais and Gioberti might become a reality,
and Italy would split up into a number of republics, amongst
which the temporal power of the pope might find a place.
Certainly his public pronouncements took on an increasingly
democratic tone. From the first he had shown great interest
in social questions; and his encyclicals deal much less with
theology than with citizenship, socialism, Christian
Socialism movement. It won up in France and Belgium,
and soon spread to Italy, Germany and Austria. It had
undoubtedly done much to awaken interest in social problems,
and to call forth philanthropic zeal; but the movement soon
travelled far beyond the limits that Leo would have set to it.
In Germany, in particular, it has grown into a political party
connected with the Social Democrats; nor have the democratic
socialists been slow to exploit their Christian allies for their
own ends. And in other countries the attempt to bring
religion into politics has sometimes had the effect of lowering
religion, rather than ennobling politics. In an age of universal
suffrage public men cannot afford to appeal to pure reason,
or even to pure sentiment. Christian socialism becomes a
real force when it translates itself into anti-Semitism; and
anti-Semitism is at its strongest when it is pursuing one par-
ticular Jewish captain in the French artillery. Much on the
same lines stands the Italian Catholic attempt to show that the
Freemasons are the real founders of Italian independence,
and to take the field against them with the help of Don
Taxin (see below). Italy, however, has its roots in the political
colouring, such attempts to meet the devotional tastes of
the masses as the miracles of Lourdes, or the modern French
religious press, lie well within the range of criticism. Nor
have they even had the dubious merit of success. Dying in
1903, Leo XIII. was spared from seeing the failure of his policy
of reconciliation with the French Republic; for the "de-
nunciation of the concordat" (December 1905) and consequent
separation of Church and State took place under his
successor, Pius X.
What results this measure may have on France it must be left to the future to decide. Nor is
it yet possible to forecast the result of the only other sensational event that the reign of Pius X. has yet produced—his
condemnation in 1907 of the complex movement known as
Modernism. This began as an attempt to break loose from the neo-Scholasticism so ardently patronized
both by Pius IX. and Leo XIII., and to supplant the
critical methods of the medieval doctors by those of modern
philosophy; and its leaders have won special distinction in
the fields of Biblical criticism and modern historical
Modernism. This movement broadened into a thoroughgoing revolt against the
modes of thought and methods characteristic of the latter-
day Vatican; its motto is that Catholicism is the strength of
popery, but popery the weakness of Catholicism. By "popery"
must here be understood the belief that spiritual doctrines
always lend themselves to a precise embodiment in black and
white, and can thereafter be dealt with like so many clauses
of an act of parliament. Modernists deny that the spirit of
religion can be thus imprisoned in an unchangeable formula;
they hold that it is always growing, and therefore in continual
need of readjustment and restatement. On the other hand,
they maintain that the present always has its roots in the past,
and that therefore every political upheaval is a work in
progress; they, consider, for instance, that northern Europe
would have done better to listen to Erasmus than to Luther. But progress can
leave little room to individual initiative, if it must always
be orderly and systematic; and the Modernists accordingly
show little sympathy with Protestantism. The core of their
creed is a fervid belief in the infallibility of Catholic instinct,
that only Catholic theology can be induced to leave it to develop
in peace. Hitherto the theologians have shown small dis-
position to hold their hand; and several of the leading
Modernists have been excommunicated (see especially the article
Loisy, A. F.), while the whole movement was condemned in
bitter and scathing language by Pius X.'s encyclical
(Pascendi gregis) against the Modernists. But ideas are difficult to kill,
and it is possible that the Modernist movement may yet prove
to be the opening chapter of a mighty revolution within the
Church of Rome.1

The Church in England.

The origin of the English Roman Catholics as a community
separated from the National Church is generally held to date
from the accession of Queen Elizabeth in 1558. In
the following year was passed an Act of Supremacy, whereby all
public officials, clerical and lay, were required to acknow-
ledge the supremacy of the queen "as well in spiritual things
or causes as temporal." This declaration all the existing
bishops, with two exceptions, refused to make; some fled
the country, some were imprisoned, others simply deprived
and placed under surveillance.2 To the parish clergy the
declaration was not critically tendered; of those deprived
of their livings a large number were allowed to remain on as
clerics in private families. From laymen, unless they
happened to hold some public office, no declaration was
expected; and during the earlier years of Elizabeth's reign
most of them continued to attend at their parish church.
The line of division became much more acute when Pius V.
deposed Elizabeth from her throne (1570); thenceforward
her government looked on every Catholic as a potential rebel.
Already it had passed a severe act against the Catholics in
1522; this was followed by other measures in 1571, 1580,
1584, 1585, 1593. During the forty-five years of Elizabeth's
reign, however, only about 180 persons suffered death—
less than half the number of those whom the Catholic zeal

1 For a criticism of the modern tendencies of the Roman Catholic Church from an outside point of view see ULTRAMONTANISM.
2 From the Roman Catholic point of view the ancient English bishops claimed to be "far the holdest in the world"; the first
such time bishop of St Asaph, at Rome on the 3rd of April 1585. Some six months previously Thomas Watson, formerly bishop
of Lincoln, had died in prison in England.

Not as heretics, by burning, but as traitors, by hanging, drawing and quartering. But, since to say or hear mass was constructive
treason, the distinction was, in many cases, without a difference.
of her sister, Queen Mary, had burnt in one-ninth of the time. Under James I. an attempt was made to distinguish between the loyal and disloyal Catholics, the latter comprising all those who maintained the pope's right to depose sovereigns from their throne. This led to seditious agitation among Catholics themselves. Many foreseeing the deposing power; the majority, acting under imperious orders from Rome, refused to deny it. The government retaliated by adding several new penal laws to the statute-book, though less than thirty Catholics were brought to the scaffold during James's reign. Under Charles I. the position of the Catholics was greatly improved, largely owing to the king's marriage with a French princess. Although not actually repealed, the penal laws were seldom put in force, and mass was openly celebrated in London and elsewhere. On the outbreak of the Civil War the Catholics naturally sided with the king, and a great many fell fighting for the royalist cause; towards the survivors Cromwell was unexpectedly merciful. Very few were put to death, though a number of estates were confiscated. Under Charles II. came a new period of prosperity; two Catholics, Lords Arlington and Clifford, were admitted to the inner circles of the government. Protestant suspicion was excited; in 1673 was passed the Test Act, obliging all office-holders to receive the sacrament in the Established Church, and to declare their disbelief in transubstantiation. Five years later (1678) popular exasperation found a more savage outlet, and greedily swallowed the total clauses of the Act "enough of your popery not." A number of victims were brought to the scaffold, and Catholics were declared incapable of sitting in either house of parliament. James II., however, was utterly indifferent to the feelings of his subjects. He packed the privy council, the army and the universities with Catholics, and tried to legalize the exercise of their religion by an utterly unconstitutional Declaration of Indulgence. Three years were enough to convince the nation that he was "endeavouring to subvert and extinguish the Protestant religion, and the laws and liberties of this kingdom;" and on his deposition in 1688 Roman Catholics, or persons married to Roman Catholics, were declared incapable of succeeding to the throne. A new oath of allegiance was imposed on all holders of civil or military office; they were required to swear that no foreign prelate had, or ought to have, any jurisdiction, whether civil or ecclesiastical, within the realm. Further, a number of statutes were passed with the object of putting every possible obstacle in the way of Catholics educating their children in their own creed, or of inheriting or buying land. That they remained so long "utterly disabled from bearing any part of the civil burthen," was due to the intervention of many of their number in the Jacobite revolts of 1715 and 1745. After Culloden, however, it was seen that all serious danger of a Stuart restoration was passed; and in 1778 Catholics who abjured the Pretender and denied the civil authority of the pope were relieved from their most pressing disabilities. A proposal to extend this measure to Scotland led to violent agitation in that country. Feeling soon spread to England, and culminated in the Gordon riots of 1780. Meanwhile, however, strenuous efforts were being made by the Roman Catholics to obtain relief by establishing a reasonable *modus vivendi* with the government. Within the Catholic body itself there was even at this time a more or less pronounced anti-Roman movement, a reflection of the Gallican and Febronian tendencies on the continent of Europe, and the "Catholic Committee," consisting for the most part of influential laymen, which had been formed to negotiate with the government, was prepared to go a long way in repudiating the extreme claims of the Holy See, some even demanding the creation of a national hierarchy in merely nominal dependence on Rome, and advocating the substitution of English for Latin in the services. This attitude led to a somewhat prolonged conflict between the Commissioners and the vicars apostolic, who for the most part represented the high ultramontane view. The outcome of the Committee's work was the great Protest, signed by 1500 bishops, priests and leading laymen, in which the loyalty of Catholics to the crown and constitution was strenuously affirmed and the ultramontane point of view repudiated in the startling declaration, "We acknowledge no infallibility in the pope." As the result of the negotiations preceding and following this action, the government in 1791 passed a bill relieving from all their more vexatious disabilities those Roman Catholics who rejected the temporal authority of the pope; and during the first quarter of the 19th century a series of attempts was made to abolish Catholic disabilities altogether. To this, however, George III. and his successors were bitterly opposed; only in 1829 did George IV. give way, and allow the passage of the Catholic Relief Act. This virtually removed all restrictions on Catholics, except that it left them incapable of filling the offices of Regent, Lord Chancellor, or Lord Lieutenant of Ireland; and it expressly debarred their priests from sitting in either house of Parliament.

**Ecclesiastical Administration.**—During the reign of Elizabeth this was necessarily in a chaotic state. As the Marian clergy died out, their place was taken by priests trained at theological colleges established for this purpose at Douai, Rome, Valladolid and other places. These were the "seminary priests," objects of great suspicion to the government. About 1850 Jesuit missionaries began to come, and soon became involved in bitter quarrels with the secular missionaries already at work. Mutual jealousies were only increased when the seculars were grouped together under an arch-priest in 1599. Nor were matters much bettered when the papacy took advantage of the presence of a Catholic queen in England, and sent over in 1625 a vicar-apostolic—that is, a prelate in episcopal orders, but without the full authority of a diocesan bishop. He was soon compelled to withdraw, and the direction of affairs fell to an intermittent series of papal envoys accredited to Henrietta Maria or Catherine of Braganza. On the accession of James II. a new vicar-apostolic—John Leyburne, bishop of Adrumetum in partibus—was at once appointed (1683); three years later England was divided into four districts—the London, Midland, Northern and Western—each under a vicar-apostolic. This arrangement was little better than the number of vicariates was increased by the addition of the Welsh, Eastern, Lancashire and Yorkshire districts. In 1830 came the "restoration of the hierarchy" by Pope Pius IX., when England was mapped out into an arch-bishopric of Westminster and twelve suffragan sees, since increased to fifteen (sixteen including the Welsh see of Menevia). This "papal aggression" caused great excitement at the time, and an Ecclesiastical Titles Act was passed in 1851, though never put in force, forbidding Roman Catholic prelates to assume territorial designations.

4 They were described in the first draft of the bill as "Protesting Catholic Dissenters;" but this was changed, in deference to the strenuous remonstrances of the vicars-apostolic, into "Roman Catholics."

4 Cardinal Wiseman (q.v.) was the first archbishop of Westminster. It was on his advice that Pope Gregory XVI. increased the number of English vicariates-apostolic in 1839, and from 1840 onward, as vicar-apostolic first in the Midlands, and London and Southwark, was mainly instrumental in bringing the English Roman Catholic Church into closer touch with "the spirit of Rome." The outward sign of this was the substitution of the Roman rite for the English pre-Reformation use liturgically followed in the services, while English Roman Catholicism became increasingly ultramontane in temper, a tendency much strengthened under Cardinal Manning.

4 The titles of the sees could not by law be the same as those of the Established Church. In several cases, however (e.g. Birmingham, Liverpool, Southwark, &c.), sees have since been created by
Population.—No trustworthy figures are forthcoming as to the numbers of the English Roman Catholics at the different stages of their history. At the accession of Elizabeth they undoubtedly formed a large proportion of the population. During her reign they were increased, and the decrees continued during the 17th century. A return, made with some apparent care soon after the accession of William III., estimates their total number at barely 30,000. During the 18th century they began to increase; a return presented to the House of Lords in 1788 estimates their numbers at nearly 70,000. Joseph Berington, himself a distinguished Catholic priest, considers that this number was above the mark; he reports that his co-religionists were most numerous in Lancashire and London; next came Yorkshire, Northumberland and Staffordshire; and the counties of the southern coast there were scarcely any Catholics at all. Even in Berington’s time, however, there was a certain tendency to increase; and the great number of conversions that followed the Relief Act of 1778 was a stock argument of opponents of the Bill. In 1820, at the Oxford Movement within the Established Church, the number of converts has been much increased; for some time past it has averaged about 8000 souls a year. But a far more potent factor in swelling the numbers of the Catholics has been the emancipation of the Irish, which began early in the 19th century, but was enormously stimulated by the famine of 1846. In 1870 Mr. Ravenstein reckoned the total number of Roman Catholics in England as slightly under 1,000,000; about 750,000 were Irish, and 350,000 English. By 1910 the general total is considered to have risen to about a million and a half.

English Law relating to Roman Catholics.—The history of the old penal laws against Roman Catholics in the United Kingdom has been sketched above and in the article IRELAND, History. The principal English acts directed against “popish recusants” will be found in the list given in the acts repealing them (7 & 8 Vic. c. 102, 1844; & 10 & 11 Vic. c. 59, 1846). The principal Irish act was 1700, c. 3; the principal Irish act, 2 Anne, c. 3. Numerous decisions illustrating the practical operation of the old law in Ireland are collected in G. E. Howard’s Cases on the Popery Laws (1775). The Roman Catholic Emancipation Act 1829 (10 Geo. IV. c. 7), although it gave Roman Catholic citizens in the main complete civil and religious liberty, at the same time left them under various disabilities, trifling in comparison with those under which they laboured before 1829. Nor did the act affect in any way the long series of old statutes directed against the assumption of authority by the Roman Catholic clergy; these are still in force. The law is the Statute of Provisions of 13 Edw. III. All the effect of the Roman Catholic Charities Act 1829 is to place Roman Catholic schools, places of worship and education, and charities, and the property held therewith, under the laws applying to Protestant nonconformists. The Toleration Act of parliament bearing the same titles, so that there are now often two bishops bearing the same style. From the point of view of the Roman Catholics, these are often only a title of courtesy, the Anglican bishop alone having the legal right to bear it.

1 See also Stephen’s History of the Criminal Laws, ii. p. 483; Anstey, The Law affecting Roman Catholics (1842); Lilly and Wallis, Manual of the Law specially affecting Catholics (1863).

1 A recusant signified a person who refused duly to attend his parish church.
compel discovery of a secret trust for superstitious uses. Since 2 & 3 Will. IV. c. 115 gifts for the propagation of the Roman Catholic faith are not void as made to superstitious uses. It should be noticed that the doctrine of superstitious uses is not confined to the Roman Catholic Church, but that it has also existed in the case of gifts made by persons of that religion. The Roman Catholic Charities Act 1860 enables the court to separate a lawful charitable trust from any part of the estate subject to any trust or provision declared to be superstitious. No Roman Catholic may insist in the absence of any written document the usage of twenty years is to be conclusive evidence of the application of charitable trusts.

(5) Patronage.—A Roman Catholic cannot present to a benefice, prebend, or stall, or to a benefice or stall in an university, college, free school, hospital or donative (3 Jac. i. c. 5). Such patronage is by the act vested in the universities, Oxford taking the City of London and twenty-five counties in England and Wales, mostly south of the Trent, Cambridge the remaining twenty-seven. The principle is at present in use in the Church of England, but in the Roman Catholic Church is not enforced, and it is not obligatory. In the absence of any written document the usage of twenty years is to be conclusive evidence of the application of charitable trusts.

The Church in the United States.

The history of Roman Catholicism in the New World begins with the Norse discoveries of Greenland and Vinland the Good. In the former the bishopric of Gardar was established in 1112, and extinguished only in 1492. To the latter (the coast of New England), the Northmen during the same period made "temporary visits for timber and peltries, or missionary voyages to evangelize for a season the natives." Beyond these facts, the Norse sagas and chronicles contribute little that is certain (cf. The Norse Hierarchy in the United States, "Amer. Cath. Quart. Review", April 1896). Although a bishop was appointed by the pope for the vaguely defined territory of Florida as early as 1528, the oldest Catholic community in what is now the United States dates from 1565, when the Spanish colony of St Augustine was founded. Hence the aboriginal tribes of the South were evangelized. In 1582 the missions of New Mexico were undertaken, and from 1601 Catholic missionaries were at work along the Pacific coast, especially in California. Early in the 17th century trading posts and mission centres were established on the coast of Maine, and during the same century French priests laboured zealously in northern New York, along the entire coast of the Mississippi from Wisconsin to Louisiana, and around the Great Lakes. Their principal concern was for the savages, over whom they acquired an extraordinary influence. Political jealousies, human avarice and treachery arrested the progress of most of their missions.

The English colony of Maryland, planned by the Catholic George Calvert (1st Lord Baltimore), and founded (1634) by his son the Catholic Cecilius Calvert (2nd Lord Baltimore), and destined (1682) to be purchased or leased to the Roman Catholic Church, by William Penn, first permitted the legal existence of Catholicism in English-speaking communities of the New World. It is from these centres that it spread during the 18th century. In 1784 the Rev. John Carroll was appointed prefect-episcopal for the Catholics of the English colonies hitherto dependent on the vicar-apostolic of London. In 1790 Father Carroll was made bishop of the see of Baltimore, and given charge of all the Catholic interests in the United States. There were then about 24,500 Catholics in the land, of which number 15,800 were in Maryland, and 7000 in Pennsylvania, 200 in Virginia and 1500 in New York. In 1807 they had grown to 150,000 with 86 churches. In the following year Baltimore founded itself the first metropolitan see of the United States, with New York, Philadelphia, Boston and Bardstown as suffragans.

The growth of the Catholic population by decades since 1820 was calculated by a competent historian, the late John Gilmary Shea, as follows:

<table>
<thead>
<tr>
<th>Year</th>
<th>Population</th>
</tr>
</thead>
<tbody>
<tr>
<td>1820</td>
<td>244,500</td>
</tr>
<tr>
<td>1830</td>
<td>320,000</td>
</tr>
<tr>
<td>1840</td>
<td>1,000,000</td>
</tr>
<tr>
<td>1850</td>
<td>1,726,470</td>
</tr>
</tbody>
</table>

The number in 1906 was 12,097,142 (U.S. Census, Special Report, 1910). The main source of this growth has been immigration. Originally the Irish and the Germans furnished the greater quota. Later the French-Canadians, Italians, Poles and Bohemians added notably to the number; an appreciable percentage of Oriental Catholics is also found,—Greeks, Syrians, Armenians, etc. Natural increase, especially among the first Catholic immigrants, and a certain percentage of conversions from Protestantism, are contributory sources. Being under the protection of the constitution, and enjoying the advantages of the common law, Catholicism could not meet with any official opposition; such few outbursts of fanaticism as there have been were only temporary or local, and did not represent the true feelings of the country. As to the future of the Church in the United States, all Catholics feel, with their latest historian, that "the Catholic Church is in accord with Christ's revelation, with American liberty, and is the soul of the American republic." The Church is threatened from the new social dangers that threaten the United States as well as the whole civilization. She has not grown, she cannot grow so weak and old that she may not maintain what she has produced—Christian civilization."

Internally, Catholicism in the United States has been free from any noteworthy schisms or heresies that might impede its development—its doctrinal history offers nothing of importance. The discipline differs little from that of the other churches of Catholicism. The unity of doctrine, liturgy and moral ideals is preserved by an intimate union with the see of Rome. The general canonical legislation of the Church, the legislation by papal rescript and the Congregation of the Propaganda, the decisions of the Apostolic Delegation at Washington, and a certain amount of immemorial custom and practice, form the code that governs its domestic relations. Decennially each bishop of the United States is expected to pay a visit to Rome (Ad Limina Apostolorum), and to make a report of the spiritual condition of religion within his diocese. In addition, a system of provincial, or local unions, among bishops, priests and laity. This each province or body of bishops under a metropolitan holds provincial councils, while at greater intervals a plenary or national council is held. Of these last three have taken place—their decrees, when approved at Rome, are binding on all Catholics in the United States.

In education the Catholic Church endeavours to keep abreast with the best. There are, according to Hoffmann's Directory (Milwaukee, 1907), 4364 parochial schools, in which 1,096,842 children of both sexes receive instruction. The total number of children in Catholic institutions is given as 1,466,175. There are 198 colleges for boys and 678 academies for girls. This system of education is crowned by the Catholic University of America at Washington, established by Leo XIII. and the American hierarchy, and endowed with all the privileges of the old pontifical universities of Europe. In addition to these, there are other schools that rank as universities. The education of the clergy is provided for by 86 seminaries, in which there are 5697 students. The charitable institutions in the Church are very numerous. There are 215 orphan asylums, with 40,658 inmates. The other charitable institutions are 992 in number, and include every form of public and private charity: no diocese is without one or more such establishments. The actual government of the Church in the United States is vested in the United States bishops together with 11,135 diocesan clergymen, under the sole and immediate direction of their bishops, 3958 members of religious orders subject to episcopal supervision—in all 15,093 clergymen. There are 5072 churches, 15,388 religious in and outside of parishes, other charitable institutions, 11,135, to which must be added 3358 chapels. Several hundred weekly publications are printed in English and foreign tongues, to minister to the needs of the Catholic population. There exist also several literary and academic magazines and reviews of a high order of merit.

The principal religious events in the recent history of the Church were the holding of the Third Plenary Council of Baltimore (1884),
the Catholic Congress (1889), the opening of the Catholic University (1889), the Columbian Educational Exhibit at Chicago (1893), the establishment of the Apostolic Delegation at Washington (1893).

The Catholic Church in the United States conducts no foreign missions, but takes care of its own percentage of Indians and Negroes. Of the Indian population of the United States about 48,194 are Catholics, and they are attended by 65 priests, who look after 96 churches or chapel; there are 50 schools conducted by members of 16 sisterhoods, in which 4,430 children are educated. The Catholic negroes are about 138,573 in number. They have 47 churches conducted by 43 white clergy; 114 schools, in which 2,318 children, conducted by 31 sisterhoods, who also conduct 11 charitable institutions. The expenses of these missions are borne by private charity, and by a general annual collection.

* * *

ROMANCE, originally a composition written in "Romance" language: that is to say, in one of the phases on which the Latin tongue entered after or during the dark ages. For some centuries by far the larger number of these compositions were narrative fictions in prose or verse; and since the special "Romance" language of France—the earliest so-called—was the original vehicle of all such fictions, the use of the term for them became more and more accepted in a limited sense. Yet for a long time there was no definite connotation of "fiction" attached to it, but only of narrative story: and the French version of William of Tyre's History of the Crusades, a very serious chronicle written towards the close of the 12th century, bears the name of Roman d'Eracle simply because the name of the emperor Heraclius occurs in the first line. But if the explanation of the name "Romance" is quite simple, certain and authentic, the same is by no means the case with its definition, or even with the origin of the thing to which that name came mostly to be applied. For some centuries an abstraction has been formed from the concrete examples. "Romance," "romanticism," "the romantic character," "the romantic spirits," have been used to express sometimes a quality regarded in itself, but much more frequently a difference from the supposed "classical" character and spirit. The following article will deal chiefly with the matter of Romance, excluding or merely referring to accounts of such individual romances as are mentioned elsewhere. But it will not be possible to conclude without some reference to the vaguer and more contentious signification.

Speculations on the origin of the peculiar kind of story which we recognize rather than define under the name of romance have been numerous and sometimes confident; but a wary and well-informed criticism will be slow to accept most of them. It is certain that many of its characteristics are present in the Odyssey; and it is a most remarkable fact that these characteristics are singled out for reprehension—or at least for comparative disapproval—by the author of the "Treatise on the Sublime.

The absence of central plot, and the prolongation rather than evolution of the story; the intermixture of the supernatural; the presence of adventure arranged rather in the fashion of a panorama than otherwise: all these things are in the Odyssey, and they are all, in varying degrees and measures, characteristic of romance. Nor are they absent from the few specimens of ancient prose fiction which we possess. If the Satyricon was ever more than a mass of fragments, it was certainly a romance, though one much mixed with satire, criticism and other things; and the various Greek survivals from Longus to Eustathius always and rightly receive the name. But two things were still wanting which were to be all-powerful in the romances proper—Chivalry and Religion. They could not yet be included, for chivalry did not exist; and such religion as did exist lent itself but ill to the purpose except by providing myths for ornament and perhaps pattern.

A possible origin of the new romance into which these elements entered (though it was some time before that of chivalry definitely emerged) has been seen by one of the least hazardous of the speculations above referred to in the hagiography or "Saint's Life," which arose at an early though uncertain period, developed itself pretty rapidly, and spreading over all Christendom (in which degrees meant all Europe and parts of Asia) provided materials with their chief supply of what may be elegantly called interesting literature. If the author of "The Sublime" was actually Longinus, the minister of Zenoib, there is no doubt that examples both sacred and profane of the kind of "fiction" ("imitation" or "representation") which he deprecated were mustering and multiplying close to, perhaps in, his own time. The Alexander legend of the pseudo-Callisthenes is supposed to have seen the light in Egypt as early as A.D. 200, and the first Greek version of that "Vision of Saint Paul," which is the ancestor of all the large family of legends of the life after death, is pretty certainly as old as the 4th century and may be as old as the 3rd. The development of the Alexandrian was to some extent checked or confined to narrow channels as long as something like traditional and continuous study of the classics was kept up. But hagiography was entirely free from criticism; its subjects were immensely numerous; and in the very nature of the case it allowed the tendencies and the folklore of three continents and of most of their countries to mingle with it. Especially the comparative sobriety of classical literature became affected by the Eastern appetite for marvel and unhesitating acceptance of it; and the extraordinary beauty of many of the central stories invited and necessitated embroidery, continuation, episode. Later, no doubt, the adult romance directly reacted on the original saint's life, as in the legends of St Mary Magdalene most of all, of St Eustace, and of many others. But there can be very little doubt that if the romance itself did not spring from the saint's life it was fostered thereby.

Proceeding a little further in the cautious quest—not for the definite origins which are usually delusive, but for the tendencies which avail themselves of opportunities and the opportunities which lend themselves to tendencies—we may notice two things very important to the subject. The one is that as Graeco-Roman civilization began to spread North and East it met, to appearance which approaches certainty, matter which lent itself greatly to the "treatise on the Sublime." That such matter was abundant in the literature and folk-lore of the East we know: that it was even more abundant in the literatures and folk-lore of the North, if we cannot strictly be said to know, we may be reasonably sure. On the other hand, as the various barbarian nations (using the word in the wide Greek sense), at least those of the North, became educated to literature, to "grammar," by classical examples, they found not a few passages in these examples which were either almost romances already or which lent themselves, with readiness that was almost insistance, to romantic treatment. Apollonius Rhodius had made almost a complete romance of the story of Jason and Medea. Virgil had imitated him by making almost a complete romance of the story of Aeneas and Dido: and Ovid, who for that very reason was to become the most popular author of the middle ages early and late, had gone some way towards romancing a great body of mythology. We do not know exactly who first applied to the legendary tale of Troy the methods which the
pseudo-Callisthenes and "Julius Valerius" applied to the historical wars of Alexander but there is every reason to believe that it was done fairly early. In short, during the late classical or semi-classical times and the whole of the dark ages, things were making for romance in almost every direction.

It would and did follow from this that the thing evolved itself in so many different places and in so many different forms that only a person of extraordinary temerity would put his finger on any given work and say, "This is the first romance," even putting aside the extreme chronological uncertainty of most of the documents that could be selected for such a position. Except by the most meteoric flights of "higher" criticism we cannot attain to any opinion as to the age and first developed form of such a story as that of Weland and Beadhold (referred to in the Complain of Deor), which has strong romantic possibilities and must be almost of the oldest. The much more complicated Volsung and Nibelung story, though we may explore to some extent the existence backwards of its Norse and German forms, baffles us beyond certain points in each case; yet this, with the exception of the religious element, is romance almost achieved. And the origin of the great type of the romance that is achieved—that has all elements present and brings them to absolute perfection—the Arthurian legend, despite the immense labours that have been spent upon it and the valuable additions to particular knowledge which have resulted from some of them, is, still more than its own Grail, a quest unachieved, probably a thing unachievable. The longest and the widest inquiries, provided only that they be conducted in any spirit save that which determines to attain certainty and therefore concludes that certainty has been attained, will probably acquiesce most resignedly in the dictum that romance "grew"—that its birthplace is as unknown as the grave of its greatest representative figure.

But when it has "grown" to a certain stage we can find it, and in a way localize it, and more definitely still analyse and comprehend its characteristics from their concrete expressions.

Approaching these concrete expressions, then, without at first too hard and fast requirements in regard to the validation of the claims, we find in Europe about the 11th century (the time is designedly left loose) divers classes or rather not a class but a number of literature, nearly all (the exceptions are Scandinavian and Old English) in verse. These are: (i) The saints' lives; (ii) the Norse sagas, roughly so-called; (iii) the French chansons de geste; (iv) the Old English and Old German stories of various kinds; (v) perhaps the beginning of the Arthurian cycle; (vi) various stories more or less based on classical legend or history from the tales of Alexander and of Troy down to things like Apollonius of Tyre, which have no classical authority of either kind, but strongly resemble the Greek romances, and which were, as in the case named, pretty certainly derived from members of the class; (vii) certain fragments of Eastern story making their way first, it may be, through Spain by pilgrimages, latterly by the crusades.

Now, without attempting to fence off too rigidly the classical from the romantic, it may be laid down that these various classes possess that romantic character, to which we are, by a process of netting and tracking, slowly making our way, in rather different degrees, and a short examination of the difference will forward us not a little in the hunt.

With i. (the saints' lives) we have least to do: because by the time that romance in the full sense comes largely and clearly into view, it has for the most part separated itself off—the legend of St Eustace has become the romance of Sir Isumbras, and so forth. But the influence which it may, as has been said, have originally must have been continually re-exerted; the romantic-dynamic suggestion of such stories as those of St Mary of Egypt, of St Margaret and the Dragon, of St Dorothea, and of scores of others, is quite unmistakable. Still, in actual result, it works rather more on drama than on narrative romance, and produces the miracle plays.

In ii. (the sagas), while a large part of their matter and even not a little of their form are strongly romantic, differences of handling and still more of temper have made some divorcement from their inclusion under romance, while their finalouting in their own literatures by versions of the all-conquering French romance itself is an argument on the same side. But the Volsung story, for instance, is full of what may be called "undistilled" romance—the wine is there, but it has to be passed through the still—and even in the most domestic sagas proper this characteristic is largely present.

It is somewhat less so in iii. (the chansons de geste), at least in the apparently older ones, though here again the comparative absence of romantic characteristics has been rather exaggerated, in consequence of the habit of paying disproportionate and even exclusive attention to the Chanson de Roland. There is more, that is, of romance in Aliscans and others of the older class, while Amis and Amiles, which must be of this class in time, is almost a complete romance, blending war, love and religion—salus, venus, virtus—in full degree.

The other four classes, the miscellaneous stories from classical, Eastern and European sources, having less corporate or national character, lend themselves with greater ease to the conditions of romance and later more easily to the characteristics of the classical stories have to drop most of their original character and allow something very different to be superinduced before they become thoroughly romantic. The greatest success of all in this way is the story of Troilus and Cressida. For before its development through the successive hands of Benoît de Sainte-More, Boccaccio (for we may drop Guido of the Columns as a mere middleman between Benoît and Boccaccio) and Chaucer, it has next to no classical authority of any kind except the mere names. In the various Alexandreids the element of the marvellous—the Eastern element, that is to say—similarly overpowers the classical. As for the Eastern stories themselves, they are particularly difficult of certain unravelling. The large moral division—such as Barlaam and Josaphat, the Seven Wise Masters in its various forms, &c., comes short of the strictly romantic. We do not know how much of East and how much of West there is in such things as Flore et Blanchefleur or even in Hous of Bordeaux itself. Contrariwise we ought to know, more certainly than apparently is known yet, what is the romance or narrative of the Arabian Nights, and it is a thing as that story of Zumurrud and Ali Shahr, which may be better known to the reader in the complete translations of the Arabian Nights, though not in the commoner editions, and which is evidently either copied from, or capable of serving as model to, a Western roman d'aventures itself.

We come, however, much closer to the actual norm itself—closer, in fact, than in any other place save one—in the various stories, English, French, and to a less extent German, 1 which gradually received in a loose kind of way the technical French term just used, a term not to be translated without danger. Nearly all these stories were drawn, by the astonishing centripetal tendency which made France the home of all romance between the 11th and the 13th centuries, into French forms; and in most cases no older ones survive. But it is hardly possible to doubt that in such a case, for instance, as Havelok, an original story of English or Scandinavian origin got itself into existence before, and perhaps long before, the French version was transferred to English, and so in other cases. If once more, we look at our existing English Havelok and its sister King Horn, we see that the latter is a more romanized form than the former. Havelok is more like a chanson de geste—the love interest in it is very slight; while in King Horn it is much stronger, and the increased strength is shown by the heroic being in some forms promoted into the title. If these two be studied side by side the process of transforming the mere story into the full romance is to no small extent seen in actual

---

1 Italian romance seems to have modelled itself early on French, and it is doubtful, rich as is the late crop of Spanish romances, whether we have any that deserve the name strictly and are really early.
operation. But neither exhibits in any considerable degree the
character of the marvellous, or the religious element, and
the love interest itself, is even in Horn, simple and not very dramatically
or passionately worked out. In the later roman d'aventures,
of which the 13th century was so prolific (such as, to give one
example out of many, Amadis and Idoine), these elements
appear fully, and so they do in the great Aucineleck collection
in English, which, though dating well within the 14th, evidently
represents the mediation and adaptation of French examples
for many years earlier.

The last of our divisions, however, exhibits the whole body
of romantic elements as nothing else does. It is not our business
to deal with the Arthurian legend generally as regards origin, contents, &c., nor, in the present division of this
actual article, to look at it except for a special purpose and in
connexion with and contradiction to the other groups just
surveyed. Here, however, we at last find all the elements of
romance, thoroughly mixed and thoroughly at home, with the
result not merely that the actual story becomes immensely
popular and widely spread; not only that it receives the
greatest amount of development of any romantic theme; but
in a curious fashion, it attracts to itself great numbers of prac-
tically independent stories—in not a few cases probably quite
independent at first—which seem afraid to present themselves
without some tacking on (it may be of the loosest and most
accidental description) to the great polycentric cycle, the stages
of which gather round Merlin, the Round Table, the Grail and
the Guinevere-Lancelot-Mordred catastrophe. All the elements,
let it be repeated, are here present: war, love and religion;
the characteristic extension of subject in desultory adventure-
chronicles; the typical rather than individual character (though
the strong individuality of some of the unknown or half-known
characters sometimes surmounts this); the admixture of the
marvellous, not merely through mainly as part of the religious
element; the presence of the chivalrous ideal. The strong
dramatic interest of the central story is rather superadded to
than definitely evolved from these elements; but they are
still present, just as, though more powerfully than, in the
predominant of miscellaneous romans d'aventures.

A further step in the logical and historical exploration of
romance may be taken by regarding the character-and-story
classes round which it instinctively groups itself,
and which from the intense community of medieval
literature—the habit of medieval writers not so much
to plagiarize from one another as to take up each after each
the materials and the instruments which were not the property
of any—is here especially observable. Prominent above everything
is the world-old motive of the quest; which, world-old
as it is, here acquires a predominance that it has never held
before or since. The object takes many variations, though not
quite infinitely various, forms, from the rights of the dis-
herited heir and the hand or the favour of the heroine, to
individual things which may themselves vary from the Holy
Grail to so many hairs of a sultan's beard. It may be a
friendly knight who is lost in adventure, or a felon knight who
has been banished for his transgressions and seeks to be
laid; a monster to be exterminated; an injured virgin or lady,
or an infernal potentate, to be succoured or avenged;
an evil custom to be put an end to; or simply some definite
adventure or exploit to be achieved. But quest of some sort
there must almost certainly be if (as in Sir Launfal, for instance)
it is but the recovery of a love forfeited by misbehaviour or
mishap. It is almost a sine qua non—the present writer,
thinking over scores, nay hundreds, of romances, cannot at the
moment remember one where it is wanting in some form or
another.

It will be observed that this at once provides the most
promising opportunity for the desultory concatenation or congregation
of incident and episode which is of the very essence of
romance. Often, nay generally, the conditions,
localities and other circumstances of the quest are half
known, or all but unknown, to the knight, and he is sometimes
intentionally led astray, always liable to be incidentally called off
by interm advent ures. In many (perhaps most) cases the love
interest is directly connected with the quest, though it may be
in the way of hindrance as well as of furtherance or reward.
The war interest always is so connected; and the religious
interest commonly—almost universally in fact—is an in-
separable accident. But everything leads up to, involves,
eventuates in the fighting. The quest, if not always a directly
warlike one, always involves war; and the endless battles
are at all times, since they ceased to be the great attraction,
continued to be the great obloquy of romance. It is possible
no doubt that reports of tournaments and single combats
with lance and sword, mace and battle-axe, may be as tedious
to some people as reports of football matches certainly are to
others. It is certain that the former were as satisfactory
in former times to their own admirers as the latter are now.
In fact the variety of incident is almost as remarkable as the
sameness. And the same may be said, with even greater
confidence, of the adventures between the fights in castle
and church and monastery, in homestead or hermitage.

The skeleton, more than, is more alike than those who have
read large numbers of modern novels critically know to be
the case with them. But the absence, save in rare cases, of
the element of character, and the very small presence of that
of conversation, show up the sameness that exists in the earlier

This same deficiency in individual character-drawing, and
in the conversation which is one of its principal instruments,
brings out in somewhat unfair relief some other
cases of apparent sameness—the "common forms"
of story and of character itself. The disinherited heir,
the unhappy or wronged wife, the wicked stepmother,
the jealous or wrongly suspected lover, are just as universal
in modern fiction as they are in medieval—for the simple
reason that they are common if not universal in nature.
But the skeleton is more obvious because it is less clothed
with flesh and garments over the flesh; the texture of the
canvas shows more because it is less worked upon. Some of
these common forms, however, are more peculiar to medieval
times; and some, though not many, allow excursions into
anomalies which, until recently, were tabooed to the
modern novelist. Among the former the wickedness of the
steward is remarkable, and of course not difficult to account
for. The steward or senechal of romance, with some honour-
able exceptions, is as wicked as the baronet of a novel, but
here the explanation is not metaphysical. He was constantly
left in charge in the absence of his lord and so was exposed
to temptation. The extreme and almost Ephesian consolable-
ness of the romance widow can be equally rationalized—and
in fact is so in the stories themselves—by the danger of the
fief being resumed or usurped in the absence of a male tenant
who can maintain authority and discharge duties. While
such themes as the usually ignorant incest of son with mother
or the more deliberate passion of father for daughter come
mostly from very popular early examples of the legend of
St. Gregory of the Oaks or the story of Apollonius of Tyana.

The last point brings us naturally to another of considerable
importance—the singular purity of the romances as a whole,
if not entirely in atmosphere and situation, yet in language
and in external treatment. It suited the purposes of the Protestant controversialists of the
Renaissance, such as our own Ascham, to throw
discredit upon work so intimately connected with Catholic
ceremony and belief as the Morte d'Arthur; and it is certain
that the knights of romance did not even take the benefit
of that liberal doctrine of the Curse Mundii which regards even
illicit love as not mortal unless it be "with spouse or sib."
But if in the romances such love is portrayed freely, and with
a certain sympathy, it is never spoken of lightly and is always
punished; nor are the pictures of it ever coarsely drawn. In
a very wide reading of romance the present writer does not
remember more than two or three passages of romance proper
(that is to say before the later part of the 15th century) which could be called obscene by any fair judge. And the term would have to be somewhat strained in reference even to these. The contrast with the companion divisions of fabliaux and farces is quite extraordinary; and nearly as sharp as that between Greek tragedy on the one hand and Greek comedy or satiric play on the other. It is brought out for the merely English reader in Chaucer of course, but in him it might have been studied. In the immense corpus of known or unknown French and English writers (the Germans are not quite so particular) it comes out with no possibility of deliberation and with unmistakable force.

The history of the forms in which romance presents itself follows a sufficiently normal and probable course. The oldest are always—save in the single case of part of the Arthurian division, in which we probably possess none of the actually oldest, and in some of the division of Antiquity which had a long line of predecessors in the learned languages—the shortest. They become lengthened in a way continued and exemplified to the present moment by the tendency of writers to add sequels and episodes to their own stories, and made still more natural by the fact that these poems were in all or almost all cases recited. "Go on" is the most natural and not the least common as well as the most complimentary form of "Bravo!" and the reciter never seems to have said "no" to the compliment. In not a few cases—Huon de Bordeaux, Ogier the Dane, Guy of Warwick, are conspicuous examples—we possess the same story in various stages; and can see how poems, perhaps originally like King Horn of not more than a couple of thousand lines or even shorter in the 13th century, grew to thirty, forty, fifty thousand in the 15th. The transference of the story itself from verse to prose is also—save in some particular and still controverted instances—regularly traceable and part of a larger and natural literary movement. While, also naturally enough, the pieces become in time fuller of conversation (though not as yet often of conversation that advances the story or heightens its interest), of descriptive detail, &c. And in some groups (notably that of the remarkable Amadis division) a very great enlargement of the proportion and degradation of the character of the marvellous element appears—the wonders being no longer mystical, and magical only in the lower sense.

And so we come to the particular characteristics of the kind or kinds in individual examples. Of these the English reader cannot have a matchless though late instance in the Morte d'Arthur of Malory, a book which is at once a corpus examples, and a pattern of romance in gross and in detail. The fact that it is not, as has been too often hastily or ignorantly asserted, a mere compilation, but the last of a singular series of rehandlings and redactions—conducted with extraordinary thoroughness for the most part indistinctly traceable instinct of genius—makes it to some extent transcend any single example of older date and more isolated composition. But it displays all the best as well as some of the less good characteristics of most if not all. Of the commonest kind—the almost pure roman d'aventures itself—the Gareth-Beaumains episode (for which we have no direct original, French or English, though Lybynis De Beu Auen, some near to it in different ways) will give a fair example; while its presentation of the later chapters of the Grail story, and the interwoven plot and continuing catastrophe of the love of Lancelot and Guinevere, altogether transcend the usual scope of romance pure and simple, and introduce almost the highest possibilities of the romantic novel. The way in which Malory or his immediate authorities have extruded the tedious wars round the "Rock of the Saxons," have dropped the awkward episode of the false Guinevere, and have restrained the uninteresting exuberance of the continental wars and the preliminary struggles with the minor kings, keeps the reader from contact with the duller sides of romance only. Of the real variety which rewards a persistent reader of the class at large it would be impossible to present even a miniature hand-index here; but something may be done by sample, which will not be mere sample, but an integral part of the exposition. No arbitrary separation need be made between French and English; because of the intimateconnexion between the two. As specially and symptomatically noteworthy the famous pair—perhaps the most famous of all—Guy of Warwick and Bevis of Hampton, should not be taken. For, with the exception of the separation of Guy and Felise in the first, and some things in the character of Josiane in the second, both are somewhat spiritless concoctions of stock matter. Far more striking than anything in either, though not consummately supported by their context, are the bold opening of Blancheflor and l'orgueilleuse d'amour, where the hero begins by kissing a specially proud and prudish lady; and the fine scenes of flight with a supernatural foe at a grave to be found in Amadas et Idoine. Reputation and value coincide more nearly in the charming fairy story of Parthenope de Bleis and the Christian-Saracen love romance of Flora (Florice and other forms) et Blancheceur. Few romances in either language, or in German, exhibit the pure adventure story better than Christien de Troyes's Chevalier au Lyon, especially in its English form of Ywain and Gawain; while the above-mentioned Lybianis Deconus (Le Beau Deconus) makes a good pair with this. For originality of form and phrase as well as of spirit, if not exactly of incident, Gawain and the Green Knight stands alone; but another Gawain story (in French this time), Le Chevalier aux deux épées, though of much less force and fire, exceeds it in length without sameness of adventure. Only the poorest romances—those ridiculed by Chaucer in Sir Thopas—which form a small minority, lack striking individual touches, such as the picture of the tree covered with torches and carrying on its summit a heavenly child, which illuminates the huge expanse of Durnart le Gallots. The various forms of the Seven Wise Masters in different European languages show the attitude of the Western to the Eastern fiction interestingly. The beautiful romance of Emare is about the best of several treatments of one of the exceptional subjects classed above—the unnatural love of father for daughter, while if we turn to German stories we find not merely in the German variants of Arthurian themes, but in others a double portion of the mystical element. French themes are constantly worked up fresh—as indeed they are all over Europe—but the Germans have the advantage of drawing upon not merely Scandinavian traditions like those which they wrought into the Nibelungen Lied and Gudrun, but others of their own. And both in these and in their dealings with French they some-what—the way an amount of story-telling power—have a power of French and English. No handling of the Tristan and Isolde story can compare with Gottfried's; while the famous Der arme Heinrich von Hartmann von Aue (the original of Longfellow's Golden Legend) is one of the greatest triumphs and most charming examples of romance, displaying in almost the highest degree possible for a story of little complexity all the best characteristics of the thing.

What, then, are these characteristics? The account has now been brought to a point where a reasoned résumé of it will give as definite an answer as can be given.

Even yet we may with advantage interpose a consideration of the answer that was given to this question universally (with a few dissentients) from the Renaissance to nearly the end of the 18th century and not infrequently since; it is rare in while it is not impossible that, in the well-attested revolu-
ROMANCE LANGUAGES

the other hand, for the last hundred years and more, there have been some who have seen in romance almost the highest and certainly the most charming form of fictitious creation, the link between poetry and religion, the literary embodiment of men's dreams and desires, the appointed nephele of more sophisticated ages as it was the appointed pastime of the less sophisticated. Between these opposites there is of course room for many middle positions, but few of these will be occupied safely and inexpugnably by those who do not hang their heads on the following conclusions.

Romance, beyond all question, enmeshes and retains for us a vast amount of story-material to which we find little corresponding in ancient literature. It lays the foundation of modern prose fiction in such a fashion that the mere working out and building up of certain features leads to, and in fact involves, the whole structure of the modern novel (p.r.). It antiquates (by a sort of gradual "taking for granted") the classical assumption that love is an inferior motive, and that women, though "they may be good sometimes" are scarcely fit for the position of principal personages. It helps to create a new unity — the unity of interest. It admits of the most extensive variety. It gives a scope to the imagination which exceeds that of any known older literary form. At its best it embodies the new or Christian morality, if not in a Phrasic yet in a Christian fashion, and it establishes a concord between religion and art in more ways than this. Incapable of exact definition, inclining (a danger doubtless as well as an advantage) towards the vague, it is nevertheless comprehensible for all its vagueness, and, informal as it is, possesses its own form of beauty — and that a precious one. These characteristics were, if perceived at all by its enemies in the period above referred to, taken at their worst; they were perceived by its champions at the turn of the tide and perhaps exaggerated. From both attitudes emerged that distinction between the "classical" and the "romantic" which was referred to at the beginning of this article. Neither idea, however, is firmly established and must be remembered that most intentionally crude (for Goethe knew the limitations of his saying), is that "Classicism is health; Romanticism is disease." In a less question-begging proposition of single terms, classicism might be said to be method and romanticism energy. But in fact sharp distinctions of the kind do much more harm than good. It is true that the one tends to order, lucidity, proportion; the other to freedom, to fancy, to caprice. But the attempt to reimpose these qualities as absolutely distinguishing marks and labels on particular works is almost certain to lead to mistake and disaster, and there is more than mere irony in the person who defines romance as "Something which was written between an unknown period of the Dark Ages and the Renaissance, and which has been imitated since the later part of the 18th century." What that something really is is not well to be known except by resting more or less considerable sections of it — by exploring it like one of its innumerable continuations, the writing of a sketch-map of that country has been attempted here.

To illustrate and reinforce the above, see in the first place articles on the different national literatures, especially French and Icelandic; as also the following:

Perceval — Pseudo-Classic Subjects. — Apollonius of Tyre; Longus; Heliodorus; Apuleius; Troy; Thebes; Caesar; Julius; Alexander the Great; Hercules; Jason; Oedipus; Virgil.

Arthurian Romance. — Arthur; Gawain; Perceval; Lancelot; Merlin; Tristan; Round Table; Graal; and the articles on romance writers such as Malory, Wolfram von Eschenbach, Chrétien de Troyes, Gottfried of Strassburg, French Romance — Pseudo-Romagn; Guillaume d'Orange; Doon de Mayence; Ogier the Dane; Roland; Renaut de Montauban (Quatre fils Aymon); Huon of Bordeaux; Girart de Roussillon; Amis et Amiel; Macciare; Partonopeus de Blois; Rutebeuf; Yvain; La Chevalerie; Gahm le Loherain; Raoul de Cambrai; Guillaume de Paleme; Adené le Roi; Benoît de Saint-Mere-loc.; &c.

Anglo-Norman. Anglo-Danian. English Romance. — Bevis of Hampton; Horn; Havelock; Guy of Warwick; Robin Hood; Maid Marian. German. — Nibelungenlied; Ortlin; Dietrich of Bremen; Wolf; Dietrich; Heldenbuch; Waltharius; Gutbrun; Hildebrand; Lay of; Ruddelie.

Northern. — Sigurd; Wayland; Hamlet; Edda.

Spanish. — Amadis de Gaula.

Italo-French — Revillon de la Rose; Griselda and kindred stories; Greviche de Brabant; Gesta Romanorum; Barlaam and Josaphat; Seven Wise Masters; Mældune; Voyage of.

Romanciers. — The first modern composition of importance on romance (putting aside the dealings of Italian critics in the 18th century with the question of romantic a. classical unity) is the very remarkable dialogue De la Lectur des vieux romans written by Gervais de Loges in Paris, 1795, which is a surprising and thoroughgoing defence of its subjects. But for long afterwards there was little save unintelligent and mostly quite ignorant depreciation. The sequence of relatively important serious works almost begins with Lord's Letters on Chivalry and Romance (1762). In succession this was followed by the general subject (which alone can be here regarded) the dissertations of Percy, Warmon and Ritson; Sir Walter Scott, Essay on Romance in the supplement to the Encyclopaedia Britannica (1816—24); Du Cros, Introduction to Romance, to be usefully supplemented and completed by its latest edition, 1888, with very large additions by H. Wolf, Allgemeine Geschicht des Romans (Jena, 1845—52); Ward, Catalogue of Romances in the British Museum (vol. i. 1882, vol. ii. 1893) (the most valuable single contribution to the knowledge of the subject); G. S. Dunsby, The Flourishing of Romance and the Rise of Allegory (Edinburgh, 1867), and its companion volumes in Periods of European Literature, W. P. Ker, The Romanic Period (16th Century) (1899); Gregory Smith, The Transition Period (1900); Hansay, The Later Renaissance (1893); W. P. Ker, Epic and Romance (1897). (G. S.)

ROMANCE LANGUAGES, the name generally adopted for the modern languages descended from the old Roman or Latin tongue, acted upon by inner decay or growth, by dialectic variety, and by outward influence, more or less marked, of all the foreign nations with which it came into contact.

During the middle ages the old Roman Empire or the Latin — speaking world was called Romania, its inhabitants Romanzi, Latin (lae, langa) as opposed to Vulgar Romance, Italian Romanzo, from Romanice logia — to speak Romance, in Old French nominative romans, objective roman() — Modern Roman, "a novel," originally a composition in the vulgar tongue. In English some moderns use Romanic (like Germanic, Teutonic) instead of Romance; some say Neo-Latin, which is frequently used by Romance-speaking scholars. By successive changes Latin, a synthetical language, rich in inflexions, was transformed into several cognate analytical tongues of few inflexions, most of the old forms being replaced by separate words. As the literary language of the ancient language died out, seemingly extinguished by the barbarism of the middle ages, all the forms of the old classical language being confounded in the most hopeless chaos, suddenly new, vigorous and beautiful tongues sprang forth, ruled by the most regular laws, related to, yet different from, Latin. How to this wonderful change brought about? How can chaos produce similarity? The explanation of this mystery has been given by Dizey, the great founder of Romance philology. The Romance languages did not spring from literary classical Latin, but from popular Latin, which, like every living speech, had its own laws, not subject to the changing literary fashions, but only to the slow process of phonetic change and dialectic variety. It is interesting to observe that much that is handed down to us in the oldest Latin literature (notably in the vocabulary) reappears in the most recent phase of Latin — the Romance languages. Thus, a verb nivere, "to snow," is known to Pauccius, but does not again appear until the time of Venantius Fortunatus, and then with a change of conjugation — nivere, while it has now a new term of life in French and Rhaeto-Romans. It is obvious that there was no break of continuity in the vulgar language, for in the later ages a verb had been formed from nivis, nivos, it must have been nivere, or nivere (Fr. neige). Here especially the words of Horace come true:

Multa renascuntur, quae jam cessidero, cadentque
Quae nunc sunt in honore vocabula, si vi etus.
Quem penes arbitrarium est et jus et norma loquendi.
The present article, embracing all the Romance languages, aims at tracing on the one hand their common origin and their common development, on the other hand at pointing out the peculiarities of the individual languages and the possible explanations of the growth of these peculiarities. Their common development is mainly dealt with under Latin language. The relation of the early vulgar Latin to the literary language, the spread of Latin following the spread of Roman rule, the prevalence of Latin over Oscan, Umbrian, Etruscan, and late Iberian and Gallic—all these matters concern rather the history of Latin than of the Romance languages. But we may say broadly that the language spoken throughout the Roman Empire at the time of Augustus was fairly uniform, and that naturally differentiation took place (varying according to regions) which were not, however, strongly marked, and which even tended to be obliterated in later times.

The main causes of these variations were twofold. (1) The process of Romanizing the various districts took place at epoch's far remote one from the other, and between the earliest and the latest settlements there is at any rate too much time (238 Fr. Artibies from Gall. are Tegias, "at the huts") and the grand division Germanic, Gaulish, Latin. (2) We find the dative illui (Ital., Fr. Rum. lui) missing in the Iberian peninsula, we may infer that it was unknown to the Latin introducers, and the dative at any rate only that of Galician type (Sp. cuesta, "cava") and not the more recent casi (Ital. cauza), also demagis or gumia, which we only know from Lucilii, Sp. demas, gomia.

We may be justified in assigning to these historic causes the beginnings of the divergence from the original uniformity. Neither active intercourse, nor the dislocations of tribes and populations brought about by the exigencies of military or colonizing enterprise, ever effected a complete fusion of these divergences. To this we must add (though this is not so often mentioned) the linguistic conditions of the Latin language (Durischmitzssatze). In early Latin d becomes r before labials, as ar or ad occurs in Plautus; avorus, arger from augeare are the ancient forms. Only arbitur has survived as a word of the day. But it has become so closely connected with the word bater, though as was soon discarded. Arger, under the influence of aggerare, aggerates, becomes aeger, and avorus was displaced by adversus. In Abruz. we have arbeneda, "snow," but adverbially arbeneda, "cold." In the Umbrian "at present" is armori instead of admori; armori is found beside Ital. abboccare.

All these forms are only attested in Italy, and they might by reason of their prefix be classed as Umbrian, since in Umbrian ar for ad is even commoner, cfr. the name Abrasale in Molise, which in Latin would be Adabula, save that the limitation to the cases that are in line with the Latin rule prove precisely that this is not a true Umbrian innovation, but of a presentation of ancient and popular forms. Beyond the limits of Italy archer has been preserved, cfr. Sp. arcen, and not only Ital. arcine; further armisaurius, "stallion," in the Latin Salica and in Rum. armesaria; perhaps ab, almeeo, "breakfast," for armueo beside Ital. adumosur.

In the second place we have, especially in Italy, clearly Umbro-Oscoan forms. Contrary to Latin use, these two dialects, the most important of all, have the ablative in bh, dh, as against Latin b, d; and Umbrian, Paelignian, &c., ð, b, from an early ci, cu, as against Latin i, u. Thus crefrat (in the glosses), as against Latin crefrat, is both by right of its vowel and consonants better, and with this we must agree in Itl. bifolo beside Lat. bulbulus; Ital. tafiari, "to feast," beside tabularia; tafono, "horsefly," beside Lat. tabanus; bulbo, beside Lat. bulbus. Further, Néap. Ottupo, October, "moment"; eyes on their bases, as in Sp. manzana, beside Ital. manfana. What has come down to us is manaper, which is not Greek, its ph notwithstanding, but which owing to its f we must take to be Osco-Umbrian; while the corresponding Latin form would be *mandar. The Latin supplies the French, the Osco-Umbrian the Italian form. As to the other instances, Varró points to sella beside villa as rustic, and to this we must add Ital. sigoria, Sardin. isira, Sp. and Port. estia (*stia for stia), "plough tail"; Ital. elce, Sardin. elge, Fr. yeuse, "holy" (*lex for lex), or Ital. pomminc, Fr. ponce, Sp. pomnes, "pumice-stones of the Roman period for ashes of Umbria"

It must not be overlooked that the last word denotes an object found chiefly in Sicily and near Naples, that is, in the ancient seat of the Oscans. It will be clear that we are dealing chiefly with words imported into the Latin language, and that those of our second category spread all over the empire, those of the first were entirely, or almost entirely, limited to Italy.

As a parallel we may cite the vocabulary of North and South Gaul, which yields a number of Gallic elements, and one may attribute its origin in the case of this relatively small conquest to the fact that these elements were more numerous than at a later stage, and there is in fact a definite justification for this inference. The so-called Endlicher glossary of the 5th century is a compilation, by the Gallo-Roman scholar of that time, of all the ancient glossaries that were then still current in the south of France. It in which we have not only dumun, "montem," cambiare, "pro re dare" (Fr. changer); caso, "brendo se blogarit (Fr. quas); nanto "salle"; Savoy. nà, "germe," but also avulu, "pomme," which was lost in later times but is preserved in its derivative amelade, "medlar."

Another Gallic word recorded by ancient tradition—tegia, "hut," still exists to-day with this meaning in the Venetic and Rhaetian branches of the North and South Gaulish populations. It is ever preserved, but was probably ultimately introduced from the time of the contact of Gauls and Roman forces. Many of these elements—e.g. braca, camisia—were widely used at so early a stage as to have penetrates into Rumania (Rum. imbärad, "put in the ground") and the Sardinian island have again scarcely if at all, passed beyond their ancient limits, even the Roman literature has preserved for us. It is true that Martial says—

"Barbara de pictis veti bascauda Britannis Sed me jam mavult dicere Roma sibi,

but only in France has lachne been preserved up to the present, while so far no traces of bascauda have been established for Italy.

Glancing over the Gallic contributions to the Gallo-Romance vocabulary, we see that they belong to a considerable extent to the sphere of agriculture, and that among the elements mentioned it is chiefly vehicles of all kinds which have Gallic names. The record of Roman times supplies us with benna, carbonem, carum, caruco, agrum, postumum, raetnam, sed, but carrum alone gained a firm footing; caruca in the form of charruce, "plough," survives in France and Sardinia, but (Fr. banne, Ital. benne) in its ancient home. Under this heading we may perhaps add tararum, "gimlet," in Isidore, Fr. tarare, Engad. tared, Sp. taladro, Port. trado; cecropium, "eagle," in Aquitaine; caro, "beast," in most of the Gauls. In Sardinia, many caruca, "plough-share," and O. Fr. ruote, Mod. Fr. ran, "furrow," Gallic *rica (cfr. Cym. rhye).

Another group is formed by ceroitce, "beer," from Gall. ceris, "to brazi, Mod. Fr. brai, "malt," brassier, "to brew," Gall. braz; lie, "yeast," Among the names of plants Gallic betula has survived wherever the tree is common. Within narrower boundaries, and in Scotland, carum, from a Gallic carum, which is cognate with O.H.G. harno, Mod. H. Germane, "ermine."

1 Cfr. G. Gröber, Archiv für lat. Lexicographie, i. 35 ff.
In this way we might amplify examples, and it should not escape notice that we have chiefly dealt with substantives, with few adjectives and hardly any verbs.1 In precisely the same way the Spanish vocabulary must have been replenished, and the Spanish form Umbral, etc., should be treated as the result of elimination. The pressure of time and space prevents us from giving the full list of eliminations; but it must be noted that the number of Romance words from the Latin is large, and that the number of Romance words from Greek is still larger. It is not easy to tell how many Romance words are of Greek origin, but it is probable that at least a quarter of the Romance vocabulary is of Greek origin. The Romance language is a mixture of Latin and Greek, and the Romance vocabulary is a mixture of Latin and Greek. The Romance language is a mixture of Latin and Greek, and the Romance vocabulary is a mixture of Latin and Greek.

1. Cf. R. Thurneysen, Keltoromansc (Halle, 1885); W. Meyer-Lübke, Einführung in die romanische Sprachwissenschaft, p. 50 ff.

2. G. I. Ascoli, Roma lettere (1880); Archivio letterario italiano, x. 260; Sprachwissenschaftliche Briefe (1887); C. St. Schuchardt, Zeitschrift für die romanische Philologie, iv. 140 and elsewhere; and Meyer-Lübke, loc. cit. 205 ff.
The vowel-system that developed in a case of time is thus as follows:

- Before 1st conson.: - e, i, o, a, u, o,
- Before 2nd conson.: - e, i, o, a, u.

In the department of flexion we find less radical changes. The genitive was the first case to disappear. In general its functions were usurped by the preposition de. But for the possessive sense, the dative was adopted, e.g. Hic requiscunt membri ad Deos frateres. For inscription from Gaul. The accusative serves for the case after prepositions under all circumstances, and therefore even in places where the older language used the ablative, e.g. magister cum suis discipulos.

In action rather Mod. incipit, should especially two stage Rum. -asti, -arunt, -ar, -amur, -aretur. For third and almost most rapidly, and soon took precedence over the other conjunctions, not only in the cases just mentioned, but in introducing object-, subject- and final-clauses.

It is in the vocabulary that it is most difficult to define the relations of the common and the literary languages. So much of the ancient common language and the modern are in the Literary language.

Among points of syntax we may single out the replacing of infinitival sentences (verbing of verbs, seeing, hearing, wishing) by clauses with ut, quod or quae, whence Ital. che, Fr. que. This passage was used most rapidly, and soon took precedence over the other conjunctions, not only in the cases just mentioned, but in introducing object-, subject- and final-clauses.

In dealing with the division of this common language into a number of groups, individual distinctions are sometimes points of view to be considered. Before we can touch upon these, we must first take a general survey of these languages. There are altogether nine—Rumanian, Dalmatian, Sardinian, Italian, Raeto-Romance, French, Provençal, Spanish and Portuguese. Of these nine languages, Raeto-Romance has persisted in the most perfect state, as the ancients were most pleased with the forms of a vehicle, in Port. "the wing of a parapet," point to a form *alapa, which meant "wing" and which must have belonged to the vulgar Tongue. As it was used in the Sabinian, there are other points which can be considered. But problems are involved which have as yet hardly been taken up.

1 C. F. Gröber, Archiv. f. Ital. Lexigraphie, i. 204 ff.
2 C. M. G. Bartoli, "Das Dalmatische" (1906), (Schriften der Balkan-Kommission der K. Akademie der Wissenschaften, linguistische Abhandlung, Bd. iv. and v.).
in Dalmatian c before e are always preserved as velars, and in south Sardinian and in Rumanian the palatalization is more recent, and secondary. The preservation of the tenues between vowels as breathed fortes is peculiar to Rumanio-Dalmatian, but as north Italian, and it seems that in some Sardinian tongues fortes have been more or less preserved. In Sardinia, preserved the fortes we have every ground for assuming that central and south Sardinia also possessed either fortes or lenes in earlier times. Moreover, south Italy, Sicily and a large part of central Italy as far as the Apennines replace the old lenes with velars, in South Bohemia, and there are in marked contrast to the regions of the Po, to Gallic and the Iberian group. All these phenomena may perhaps be explained in conjunction with two historical events. By the abandonment of the process of lening, the laryngeal rhythm and the loss of fortition in the languages of nearest affinity; and the division of the empire under Diocletian and Constantine necessarily entailed a linguistic division. At that epoch the linguistic conditions were roughly as follows:

The principal changes in the vowel-system, especially the development of qualitative beside quantitative variations, had been accomplished, but there was still a difference between i and e, a and o. The old future had disappeared, and no tendency to produce a substitute had as yet appeared. The Latin diphthongs were still maintained its old usage, probably also the imperfect subjunctive and the future perfect. In declensions the type membra, -a, had begun to spread; but corpus, -ora, was still in existence. Sardinian and Rumanian would have been, perhaps, owing to its isolation, the first to have detached itself from this group. For it was not content with differentiating c and i, but it also retains -s, whereas the East-Rumanian and an Italian group suppressed -s, and in consequence the two groups can be clearly differentiated as two accusative singular. This and the levelling of neuters in -us and masculines in -is made it possible for the types membra and corpora to spread at the expense of the type loci, -i, a possibility of which South Italian and Rumanian made the fullest use.

Given the varied developments carried on their various developments, influenced partly by contiguity of other idiom, partly by causes unknown to us. Among neighboring idiom, Greek had by right of its degree of civilization and its political power been, perhaps, owing to its isolation, the first to have detached itself from this group. For it was not content with differentiating c and i, but it also retains -s, whereas the East-Rumanian and a Italian group suppressed -s, and in consequence the two groups can be clearly differentiated as two accusative singular. This and the levelling of neuters in -us and masculines in -is made it possible for the types membra and corpora to spread at the expense of the type loci, -i, a possibility of which South Italian and Rumanian made the fullest use.

In its consonants, and, as far as one can judge, in its morphology, Dalmatian has preserved the stamp of antiquity. But in its vocal-system there are marked changes, especially in the substitution of diphthongs for close vowels, e.g. changing a to e, u through the a stage to o, i to e, o to i. These changes are also in Istrian and Abruzzian, so that we must presuppose some sort of influence.

It may be that Sardinian too another language which developed in the last glacial time, and was affected from Rome and influence from the African empire of Genseric, king of the Vandals. Therefore the sympathies of Sardinia were alienated from Italy, and turned on the one hand towards Africa (and unfortunately we have no information about the language of the barbarian tribe that lived towards the Iberian peninsula. These conditions lasted for a while, but later we find Genoa and Pisa fighting at intervals for supremacy in Sardinia, their organization being in many points identical with that of the island. On the whole, this new combination has not been so favorable to the continuation of the primitive Italian speech, as well as the velarization of c before e, i, remained unchanged, neither did they get as far as to adopt the future-forms current on the mainland; on the contrary, the use of the future-forms is still more or less independent of the present system of words. The formation of future-forms is also in Sardinia fairly well conserved, and still dominant. The future-forms of Sardinia seems to be an independent formation of future-forms, and the future-forms for to be present are not to be found in the languages of the Iberian peninsula.

The Iberian group was marked primarily by a striking simplicity in its flexions. The three-case system was given up at an early stage, and the two-case system was generally used. Moreover, Owing to the preservation of -s the type membra was doomed to perish, and thus we find, from the beginning of our record and therefore presumably soon after the great cleavage took place, the two-system in its fullest development. As e.g.: membra, e, o, -s; plur. -es, -os, -as. The loss of the dative may have some connexion with the fact that the form illus for the 3rd personal pronoun had not yet established itself; and the desire for uniformity may have ousted the nominative of -es stems. There are some exception for to the connexion.

The vocabulary is characterized by certain archaisms, and still more by the fact that a series of common ideas are rendered by terms of Latin origin. E.g.: to be called, tuono, querer (querere) instead of velle; loquer (loque) instead of manere; cantar (cantari) instead of manere; lacer (lacer) instead of lacer; hablar (hablar) instead of parler; to speak 1; inlegar (inlegare), to arrive 2; dejar 3 instead of dobor; seco instead of secus. In most cases there are no alternations of tenses. The present middle form shows the sleeping of the present tense, and is the only way of expressing the present tense.

We have seen that the new combinations have not been so favorable to the continuation of the primitive Italian speech, as well as the velarization of c before e, i, remained unchanged, neither did they get as far as to adopt the future-forms current on the mainland; on the contrary, the use of the future-forms is still more or less independent of the present system of words. The formation of future-forms is also in Sardinia fairly well conserved, and still dominant.

1 See Thielmann, in Archiv f. lat. Lexikogr. ii. 48 seq.
Romance Languages

The Raetic dialects, in their prehistoric phase, are less clear than others. Their contact, at an age nearing the Carolingian, with the French of the south-east in Valais seems to have caused a similar process of growth, especially as they change e and o into the digraphs eu, ou, leaving at the same time the consonants more intact. At an early stage the inroads of the migrating nations cut off Raetia from the Po valley, and the pressure of the German tribes severed its union with the Romance-speaking nations that had continued their development along its own course. This language also preserved at first the three cases, the type membra, the latter being developed later freely in use as a collective plural. But its further development was checked by the Lombards and Visigoths.

But the most difficult problems are those that arise in Italy. Though one may say generally that the dialects of the Po, and those of Liguria, belong to the types of north and western Romance, that is to say that the breathed plosives between vowels were reduced, yet they approach the typically Italian ones in their loss of -s. This means that when the whole Italian peninsula was separated from Gaul as well as from Iberia (after the close of the 5th century) and became again one homogeneous whole, the Romance ideas of their way into the north of Italy only slowly, so that s has remained in the west, i.e. in Piedmont, in mono-syllabic words to this day, e.g. as, "thou hast," ses, "thou art;" the same rule prevailed in older times in the east, in Venice, and there the reduced form of the plural was kept in forms ending in -es, the e.g. venis-tu, "comest thou?" and the old form maintained itself in Milanese in the single form sìtu, "art thou?"

To the loss of s we trace the extinction of declensions, but as its action began perhaps a little before the formation of the Romance language, the form may survive in a similar influence has changed c, pl, and fl an f (chiamare, pianta, fiamma). For it is precisely this point that differentiates both the Raetic dialects and Provençal from the Italian dialects, and the change certainly took place only after the latter had cut off their last remaining bond. The other element may not be overlooked which we have touched more than once in the above sketch, for it bears directly on the Romance vocabulary as to deserve the tribute of a general survey: this is the German.

When mercenaries of Germanic origin pervaded the Roman armies, Germanic words found their way first into the language as borrowed words, or names of animals which the Romans learned to know in the German-speaking north, e.g. gans, "goose" (in Pliny), O. Fr. ganto, Prov. gantia; or taxo, "badger," O. Fr. tassone, Fr. tasson, Sp. tejon. But the impression made was not pronounced until the age of the Germanic invasions, and then was most evident in the vocabulary. As late as the 1st century, when we have two invasions to consider—with the Goths, and by the Lombards. But the destruction of the rule of the Lombards by Charlemagne, and the introduction of Frankish elements conformed to the Latin sound standard, "used by Procopius, which still continues in the form of O. Fr. ban, Ital. bandiera, Sp. bandera, &c. Brit. "bride," "daughter-in-law," which occurs frequently in inscriptions, may possibly be of Frankish origin, and thus it is possible that the Romance vocabulary has been strongly influenced by the north, especially in Tuscany.

The rich and development of the Romance languages in its larger outline, appeal to the imagination as a historical phenomenon closely bound up with the fate of nations. One element must not be overlooked which we have touched more than once in the above sketch, for it bears directly on the Romance vocabulary as to deserve the tribute of a general survey: this is the German.

When mercenaries of Germanic origin pervaded the Roman armies, Germanic words found their way first into the language as borrowed words, or names of animals which the Romans learned to know in the German-speaking north, e.g. gans, "goose" (in Pliny), O. Fr. ganto, Prov. gantia; or taxo, "badger," O. Fr. tassone, Fr. tasson, Sp. tejon. But the impression made was not pronounced until the age of the Germanic invasions, and then was most evident in the vocabulary. As late as the 1st century, when we have two invasions to consider—with the Goths, and by the Lombards. But the destruction of the rule of the Lombards by Charlemagne, and the introduction of Frankish elements conformed to the Latin sound standard, "used by Procopius, which still continues in the form of O. Fr. ban, Ital. bandiera, Sp. bandera, &c. Brit. "bride," "daughter-in-law," which occurs frequently in inscriptions, may possibly be of Frankish origin, and thus it is possible that the Romance vocabulary has been strongly influenced by the north, especially in Tuscany.
510 ROMAN DE LA ROSE—ROMAN EMPIRE, LATER

of Gothic is the change of ơ to ı, so that it has names ending in -mir. Of these we find no trace whatever in Italian, on the contrary we find Gundimar, Iñidmar, &c. Then we have abbreviated forms in fr, or, e.g. Gudskizo, Albizo, &c., which are distinctly Lombardic; but similarly we find the Lombardic in the Old High German in the Iberian peninsula. But these we have said, the Gothic contribution to the vocabulary is very slight. But in the 11th century the great majority of proper names is Gothic; e.g. Fr. baïtir, "to build," from *batajan, "to bind together with haste;" Fr. plait; houder, "to cover with boards," from kurd, "hurdle;" maçon, the mason, in Isidore makjg (Frankish rather than Gothic) refer to house-building; guderer from waskyan, broder from *brun, point, and matian, to cover (also in Fr. matelas, Ital. matrasso, Ger. Matratze, lat. Matraza). Dinsan and O. Fr. treschter, "to dance," from *trestan, "to thresh," to their amusements. Women's work is probably denoted further in vouer, roijan, and E. Frank. noiser, noifar, to net, the net, the mesh, its net. Fr. haler, the woman, or the chips, or the chips. Even after political and literary independence had enabled the individual Romance languages to grow as separate units on their own basis, they retained their interconnection and were open to new words. But, as has already been shown, this affects nothing but the vocabulary, and has a certain relation to various tendencies in the developments of civilization. And under this head the most important point is the really enormous influence which France (both south and north) has exercised on the Romance languages, just as she exercised the Germanic influence which has hitherto now been duly recognized. The first traces go back to the invasions of Charlemagne already mentioned. To instance only one, we have schauersc, "justice, alderman," which cannot be derived directly from the Germanic, as is shown by the v. The second important period is the age of chivalry and the literary tendencies centring round it. A word like budrere, "butcher," is derived from Fr. baderer, not directly from Germanic Balderes, but from English baider, and it must be observed that English bauder is itself derived from an Old English *bæðora, *bæðer, "towel," from hwæltha, and ribbons (bande from binda) with gued, "gudge", and other colouring matters, whence we have, e.g. brun, bleu, blond, blanc.

But while the vocabulary has had its accessions drawn from the various national names the languages show the same rules as in Italian, i.e. Frankish gains the sole supremacy. We find, it must be admitted, some Gothic names in -mir in the south early in the middle ages, but they were not maintained as late as the Romance period, such as *hadufonsus, which has become prefixed to the Spanish of the present day. Although the political independence of the southern states has caused the languages of the south to be more heterogeneous than those of the north, we find that the Romance languages of the south have continued to affect each other, and have developed together. Thus in Mexican Spanish the loss of d, g, between vowels, of a before consonants and as a final, has been carried further than in the father-country. There are no proved traces of any noticeable influence from the languages of the natives.

LITERATURE. For a comprehensive and detailed account of Romance philology see W. Meyer-Lübke, Einleitung in die romanische Philologie (2nd ed., Strassburg, 1906); and in W. Meyer-Lübke's Grammatik der romanischen Sprachen (4 vols., Leipzig, 1890-1900); Einführung in die romanische Sprachwissenschaft (2nd ed., Heidelberg, 1890); Romanische Forschungen (ed. Vollmöller, since 1885); Romance literature, as shown in G. Perfumo, Poesia Romana (ed. G. Paris and P. Meyer; since 1812); Archivio giografico italiano (ed. G. I. Ascoli; since 1873). The great development of Romance philology after Diez is due principally to A. Tobler, G. Perfumo, and A. Nusch in Germany; A. Mussafia (1905), H. Schuchardt in Austria; G. Paris (d. 1905), P. Meyer in France; G. I. Ascoli (d. 1907), and F. D'ovidio in Italy. (W. M.-L.)

ROMAN DE LA ROSE. A French poem dating from the 13th century. The first part was written about 1250 by Guillaume de Lorris (q.v.), whose work formed the starting-point, about forty years later, for the more extensive section written by Jean de Meun (q.v.). Guillaume de Lorris wrote an allegory, possibly of an adventure of his own, which is an artistic and beautiful presentment of the love philosophy of the troubadours. In a dream the Lover visits a park to which he is admitted by Idleness. In the park he finds Pleasure, Delight, Cupid and other personages, and at length the Rose. Welcomespring concession to kiss the Rose, but he is driven away by Darkness, She-Sadness, and the Satyr Entrenches the Rose and imposes Welcome, leaving the Lover disconsolate. The story, thus left incomplete by its inventor, was finished in 15,000 lines by Jean de Meun, who allows the Lover to win the Rose, but only after a long siege and much discourse from Reason, the Friend, Nature and Genius. In the second part, however, the story is entirely subsidiary to the display of the author's encyclopaedic knowledge, to picturesque and poetic digressions, and to violent satire in the manner of the fabliaux against the abuse of power, against women, against popular superstition, and against the celibacy of the clergy. The length of the work and its heterogeneous character proved no bar to its enormous popularity in the middle ages, attested by the 200 MSS. of it which have survived.

The Roman de la Rose was translated into English by Chaucer (see the prologue to the Legende of Good Women), but the version of that, extending to about one-third of the whole work, which has come down to us (see an edition by Dr Max Kalman, Chaucer Society, 1891), is generally admitted to be by another hand. For a list of books on the vexed question of the authorship of the English translation see G. Körting, Grundzüge der engl. Lgs. (Minister, 1906, 4th ed. 1814). A Flemish version by Hein van Aken appeared during Jean de Meun's lifetime, and at the beginning of the 14th century a free imitation, in the form of a series of sonnets, Ili Fiore, was written in Italian by the Tuscan poet Durante. Three French translations of the Roman de la Rose by two Venetian authors, between 1473 and 1490; two by Antoine Verard (Paris, 1490, 1496, 1497), by Jean de Prè (Paris, 1493), by Nicholas Desprez for Jean Petit (Paris), by Michel le Noir (Paris, 1503 and 1518). In 1503 Jean de la Bruyère published a Latin translation and commentary, and followed the text (1526), and his corrections were followed in subsequent editions. Modern editions are by M. (4 vols., 1813), by Franciscus Michel (2 vols., 1864), by Coussin (1878-80), and a critical edition by E. Langlois, author of Origin et sources du Roman de la Rose (Paris, 1890). There is a modern English version by F. S. Ellis (Temple Classics, 3 vols., 1900).

ROMAN EMPIRE, LATER. The reign of Constantine the Great forms the most deep-reaching division in the history of Europe. The external continuity is not broken, but the principles which guided society in the Greek and Roman world are replaced by a new order of ideas. The emperor-worship, which expressed a belief in the ideal of the earthly empire of Rome, gives way to Christianity; this is the outward sign that
a mental transformation, which we can trace for 300 years before in visible processes of decay and growth, had reached a crisis.

Besides the adoption of Christianity, Constantine's reign is marked by an event only second in importance, the shifting of the centre of gravity of the Empire from the west to the east by making Byzantium a second capital, a second Rome. The foundation of Constantinople (q.v.) determined the subsequent history of the state; it established permanently the division between the eastern and western parts of the Empire—a principle already introduced—and soon exhibited, though not immediately, the preponderance of the eastern half. The eastern provinces were the richest and most resourceful, and only needed a Rome in their midst to proclaim this fact; and further, it was eastward that the Empire fronted, for here was the one great civilized state with which it was in constant antagonism. Byzantium was refounded on the model of Rome, had its own senate, and presently a praefectus urbi. But its character was different in two ways: it was Christian and it was Greek. From its foundation New Rome had a Christian stamp; it had no history as the capital of a pagan empire. There was, however, no intention of depressing Rome to a secondary rank in political importance; this was brought about by the force of circumstances.

The Christian Roman Empire, from the first to the last Constantine, endured for 1130 years, and during that long period, which witnessed the births of all the great modern nations of Europe, experienced many vicissitudes of decline and revival. In the 5th century it lost all its western provinces through the expansion of the Teutons; but in the 6th asserted something of its ancient power and won back some of its losses. In the 7th it was brought very low through the expansion of the Saracens and of the Slavs, but in consequence of internal reforms and prudent government in the 8th century it was able before the end of the 9th to initiate a new brilliant period of power and conquest. From the middle of the 11th century a decline began; besides the perpetual dangers on the eastern and northern frontiers, the Empire was menaced by the political aggression of the Normans and the commercial aggression of Venice; then its capital was taken and its dominions dismembered by Franks and Venetians in 1204. It survived the blow for 230 years, as a shadow of its former self.

During this long life its chief political rôle was that of acting as a defender of Europe against the great powers of western Asia. While it had to resist a continuous succession of dangerous enemies on its northern frontier in Europe—German, Slavonic, Finnic and Tatar peoples—it always considered that its front was toward the east, and that its gravest task was to face the Persians which successively inherited the dominion of Cyrus and Darius. From this point of view we might divide the external history of the Empire into four great periods, each marked by a struggle with a different Asiatic power: (1) with Persia, ending c. 630 with the triumph of Rome; (2) with the Saracens, who ceased to be formidable in the 11th century; (3) with the Seljuk Turks, in the 11th and 12th centuries; (4) with the Ottoman Turks, in which the Roman power went down.

Medieval historians, concentrating their interest on the rising states of western Europe, often fail to recognize the position held by the later Empire and its European prestige. Up to the middle of the 11th century it was in actual strength the first power in Europe, except in the lifetime of Charles the Great, and under the Comneni it was still a power of the first rank. But its political strength does not express the fullness of its importance. As the heir of antiquity it was universally superior in civilization, and it was supreme in commerce. Throughout the whole period (to 1204) Constantinople was the first city in the world. The influence which the Empire exerted upon its neighbours, especially the Slavonic peoples, is the second great rôle which it fulfilled for Europe—a rôle on which perhaps the most speaking commentary is the doctrine that the Russian Tsar is the heir of the Roman Caesar.

The Empire has been called by many names—Greek, Byzantine, Lower (bas-empire), Eastern (or East-Roman). All these have a certain justification as descriptions, but the only strictly correct name is Roman (as recognized in the title of Gibbon's work). The continuity from Augustus to Constantine II, the unbroken line of emperors was always the Roman emperor; his subjects were always Romans (Pelasgos: hence Roman—modern Greek). "Greek Empire expresses the fact that the state became predominantly Greek in character, especially after the loss of the Latin provinces, afterwards of Syria and Egypt; and from the middle of the 6th century Greek became the official language. "Lower Empire" (Later is preferable) marks the great actual distinction in character between the development before Constantine I (haut-empire) and after his adoption of Christianity. "Byzantine" sums up in a word the unique Graeco-Roman civilization which was centred in New Rome. Eastern is a term of convenience, but it has been used confusingly; it is not to designate the eastern half of the Empire during the 80 years or so (from 395) when there were two lines of emperors, ruling formally as colleagues but practically independent, at Rome and Constantinople. But there was only one Empire. It has also been used, justifiably, to distinguish the true Roman Empire from the new state founded by Charles the Great (800), which also claimed to be the Roman Empire; Eastern and Western Empire are from this date forward legitimate terms of distinction. But between the periods to which the legitimate and illegitimate uses of the term "Eastern Empire" apply lies a period of more than 300 years, in which there was only one Empire in any sense of the word.

A chronological table of the dynasties will assist the reader of the historical sketch which follows.

Succession of Emperors arranged in Dynasties.

1. CONSTANTINIAN DYNASTY.—A.D. 324-363.

2. VALENTINIANIC DYNASTY.—A.D. 364-392.

3. THEODOSIAN DYNASTY.—A.D. 392-403.
   Emperors: Theodosius I, 392-395; Theodosius II, 408-450; Marcian, 450-457. Inter-Dynasty.—Honourius, 453-454; Valentinian III, 454-455; Valentinian III, 455-456; Avitus, 455-456.

   Emperors: Leo I, 457-458; Leo II, 457-458; Leo III, 474-478; Anastasius I, 491-518. Inter-Dynasty.—Jovianus, 518-519.

5. JUSTINIANIC DYNASTY.—A.D. 518-602.
   Emperors: Justin I, 518-527; Justinian I, 527-565; Justin II, 565-578; Tiberius II, 578-582; Maurice, 582-602. Inter-Dynasty.—Phocas, 602-610.

6. HERACLIAN DYNASTY.—A.D. 610-711.
   Emperors: Heraclius, 610-641; Constantine III, 641-642; Heraclius, 642-647; Constantine IV, 647-654; Constantine V, 654-668; Leo IV, 668-678.

7. ISURIAN (SYRIAN) DYNASTY.—A.D. 717-802.
   Emperors: Leo III, 717-740; Leo IV, 740-775; Michael I, 775-802. Inter-Dynasty.—Michael II, 780-797.

8. PYSAGRIP or ARAMIAN DYNASTY.—A.D. 820-867.
   Emperors: Michael II, 820-829; Michael III, 829-842; Michael III, 842-867.

   Emperors: Basil I, 867-886; Basil II, 886-912; Constantine VII, 912-959.
Historical Sketch.—Dioecletian's artificial experiment of two Augusti and two Caesars had been proved a failure, leading to twenty years of disastrous civil wars; and when Constantine the Great (q.v.) destroyed his last rival and restored domestic peace, he ruled for the rest of his life with undivided sway. But he had the misfortune to be the first of a new portion of the Empire after his death, and to make them strong and capable, Constantius first annexing the share of Constantine II. (340) and becoming sole ruler of the west, to be in turn destroyed by Constantius II., who in 350 remained sole sovereign of the Empire. Having no children, he was succeeded by his cousin, Julian the Apostate (q.v.). This period was marked by wars against the Germans, who were pressing on the Rhine and Danish frontiers, and against Persia. Julian lost his life in the eastern struggle which was then terminated by a disadvantageous peace. But the German danger grew graver, and the battle of Adrianople, in which the Visigoths, who had crossed the Danube in consequence of the coming of the Huns (see GÖRNS and HUNS), won a great victory, and the emperor Valens perished (378), announced that the question between Roman and Teuton had entered on a new stage. Theodosius the Great saved the situation for the time by his Gothic pacification. The efforts of a series of exceptionally able and hard-working rulers preserved the Empire intact throughout the 4th century, but the dangers which they weathered were fatal to their weaker successors. On the death of Theodosius the decisive moment came for the expansion of the Germans, and they took the tide at the flood. There were three elements in the situation. Besides the Teutonic peoples beyond the frontier there were dependent people who had settled within the Empire (as Visigoths in Moesia, Vandals in Pannonia), and further there were the semi-Romanized Germans in the service of the Empire, some of whom had risen to leading positions (like Merobaudes and Stilicho). A Germanization of the Empire, or part of it, in some shape was inevitable, but, if the rulers of the 5th century had been men of the same stamp as the rulers of the 4th, the process might have assumed a different form. The sons of Theodosius were both incapable; and in their reign the future of the state which was divided between them was decided. The Dualism between the east (under Arcadius) and the west (under Honorius) developed under the rule of these brothers into antagonism verging on hostility. The German danger was averted in the east, but it led in a few years to the loss of many of the western provinces, and at the end of ninety years the immediate authority of the Roman Emperor did not extend west of the Adriatic. The reign of Honorius saw the abandonment of Britain, the establishment of the Visigothic kingdom in Aquitaine, the occupation of a great part of Spain by Vandals and Sueves (Suebi). Under Valentinian III. the Vandals founded their kingdom in North Africa, the Visigoths shared Spain with the Sueves, the Burgundian kingdom was founded in S.E. Gaul. The last Roman possession in Gaul passed to the Franks in 486 (see GÖTHS; VANDALS; FRANKS). It is significant that the chief defender of the Empire against the Germans who were dismembering it were men of German race. Stilicho, who defended Italy against Alaric, Aetius, whose great work was to protect the imperial possessions in Gaul, and Ricimer. It was also a German, Fravitta, who played a decisive part in suppressing a formidable Gothic movement which menaced the throne of Arcadius in 399-400. It was characteristic of this transformation of Europe that the Germans, who were imbued with a profound reverence for the Empire and its prestige, founded their kingdoms on Roman soil in the first instance as "federates" of the Emperor, on the basis of formal contracts, defining their relations to the native provincials; they seized their dominions not as conquerors, but as subjects. The double position of Alaric himself, as both king of the Visigoths and a magister militum of the Empire is significant of the situation.

The development of events was complicated by the sudden growth of the transient empire of the Huns (q.v.) in central Europe, forming a third great power, which, reaching from the Rhine to the Caucasus, from the Danube to the Baltic, might be compared in the extent of its nominal supremacy, but in nothing else, to the empires of Rome and Persia. The Huns, whose first appearance had precipitated the Germans on the Empire, now retarded for some years the process of German expansion, while they failed in their own attacks upon the Empire. On Attila's death (453) his realm collapsed, and his German vassals (Ostrogoths, &c.) founded important kingdoms on its ruins.

After the death of Valentinian III., the worst of his house, the Theodosian dynasty expired in the west, and the authority of the western emperors who succeeded him in rapid succession reached little beyond Italy. For most of this period of twenty years the general Ricimer, of German birth, held the scales of power in that peninsula, setting up and pulling down emperors. After his death the western throne was no longer tenable. First there was a usurpation; the general Orestes set up his child-son Romulus Augustulus against the legitimate Augustus, Julius Nepos, who was acknowledged by the eastern emperor, but this temporary government was overthrown (476) by a Germanic military revolution headed by Odoacer, who appropriated part of the soil to his German soldiers and founded an Italian kingdom under the nominal supremacy of the emperor at Constantinople, who, however unwilling, recognized his position (after the death of Julius Nepos).

The escape of the eastern provinces from the fate of the western illustrates the fact that the strength of the Empire lay in the east. These provinces were more populous and presented greater obstacles to the invaders, who followed the line of least resistance. But it was of immense importance that throughout this period the Empire was able to preserve a practically unbroken peace with its great eastern rival. The struggle with Persia, terminated in 363 by the peace of Jovian, was not renewed till the beginning of the 6th century. It was of greater importance that the rulers pursued a discreet and moderate policy, both in financial administration and in foreign affairs; and the result was that at the end of a hundred years the diminished Empire was successfully conducted. Theodosius II. was a weak prince, but his government was firmly conducted by Anthemius, by his brother Pulcheria and by the eunuch Chrysaphius. His reign was important for the Armenian question. Theodosius I. had committed the error of consenting to a division of this buffer state in the Roman and Persian spheres of influence, Persia having much the larger. The
Sassanian government tried to suppress the use of the Greek language. But the government of Theodosius II. officially supported the enterprise of translating the Bible into Armenian (Mesrob had just invented the Armenian alphabet), and this initiated the production of an abundant literature of translations from the Greek, which secured the perpetual connexion of Armenia with European culture, and not with Oriental. This reign is also distinguished by the building of the great landswalls of Constantinople, by the foundation of a university there and by the collection of the imperial laws in the Codex Theodosianus, which is a mine of material for the social condition of the Empire. It reveals to us the decline of municipal liberty, the decay of the middle classes in the West, the evils of the oppressive fiscal system and an appalling paralysis of Roman administration which had once been so efficient; it shows how the best-intentioned emperors were unable to control the governors and check their corruption; and discloses a disorganization which facilitated the dismemberment of the Empire by the barbarians.

In the reign of Zeno it seemed probable that an Ostrogothic kingdom would be established in the Balkan peninsula, but the danger was diverted to Italy (see Gorius). The kingdom which Theodoric founded there was, in its constitutional aspect, a continuation of Odoacer's régime. He, like Odoacer and Alaric, held the double position of a German king and a Roman official. He was magister militum as well as rex. His powers were defined by capitulations which were arranged with the emperor Anastasius and loyally observed. The right of legislation was reserved to the emperor, and Theodoric never claimed it; but for all practical purposes he was independent.

In the 6th century the emperor Justinian, whose talents were equal to his ambitions, found himself, through the financial prudence of his predecessors, in a position to undertake the reconquest of some of the lost western provinces. The Vandal power had declined, and Africa was won back in one campaign by Belisarius in 533. The conquest of Italy was far more difficult. Begun by Belisarius in 535, it was not completed till 554, by Narses. A portion of southern Spain was also won from the Visigoths, so that the Romans again commanded the western straits. Justinian, possessed by large ideas and intoxicated with the majesty of Rome, aspired to be a great conqueror, a great lawgiver, a great pontiff, a great diplomatist, a great builder, and in each of these spheres his reign holds a conspicuous place in the annals of the Empire. His legal work alone, or the building of Santa Sophia was enough to ensure him immortal fame. But deep shadows balance the splendour. The reconquest of Africa was thoroughly justified and advantageous, but Italy was bought at a ruinous cost.

In the first place, the Persian empire was at this time ruled by one of its greatest kings, Chosroes I. (q.v.), who was far from peacefully inclined. Justinian was engaged in a long Persian and a long Gothic war at the same time, and the state was unequal to the strain. In the second place, it was all-important for his western policy to secure the goodwill of the Italian provincials and the Roman bishops; this he secured by involving himself in an ecclesiastical policy (see below) which caused the final alienation of the Syrian and Egyptian provinces. The reconquest of the West was purchased by the disunion of the East. Thirdly, the enormous expenses of the Italian and Persian wars, augmented by architectural undertakings, caused a policy of financial oppression which hung as a cloud over all the brilliance of his reign, and led to the decline which ensued upon his death. Nor is it to be forgotten that he had at the same time to fulfil the task of protecting the Danube against the Germans, Slavs and Bulgarians who constantly threatened the Illyrian provinces. He spared no expense in building forts and walls. Justinian's name will always be associated with that of the gifted Theodora, an actress of doubtful fame in her early life, who shared his throne. Their mosaic portraits are preserved in the contemporary church of San Vitale at Ravenna. She possessed great political influence, and the fact that she was a heretic (monophysite), while Justinian was devoted to orthodox,
did not mar their harmony, but only facilitated the policy of extending secret favour to the heretics who were publicly condemned, and enabled the left hand to act without the knowledge of the right. The events of the half-century after Justinian's death exhibited the weakness to which his grandiose policy had reduced the Empire. It was attacked on the west, on the north and on the east, and at all points was unequal to coping with its enemies. (1) Italy fell a victim to the Lombards (g.v.), and in a few years more than half of the peninsula had passed under their sway. (2) The Avars, a Hunnic people who had Advanced from the Caspian, took possession of Pannonia and Dacia, and formed an empire, consisting of Slavonic and Bulgarian subjects, which endured for about sixty years. Their chief occupation was to invade the Illyrian peninsula and extort tribute and ransoms from the emperors. So far as the Avars themselves were concerned, these incursions had no permanent significance, but the Slavs who overran the provinces did more than devastate. These years saw the beginning of the Slavonic settlements which changed the ethnical character of the peninsula, and thus mark the commencement of a new period. Slavs occupied Moesia and a large part of Persia, even close to Thessalonica, which they besieged; they penetrated southward into Greece and made large settlements in the Peloponnesus (see Greece, History, "Roman period," ad fin.). They occupied the north-western provinces, which became Croatia and Servia, as well as Dalmatia (except some of the coast towns). In the northern part of the peninsula the Slavonic element remained dominant, but in Greece it was assimilated to the Greek (after the 9th century) and has left little record of itself except in place names. (3) The Empire was simultaneously engaged in the perennial strife with Persia. A short interval of peace was secured when the emperor Maurice assisted Chosroes II. to dethrone a usurper, but after Maurice's death (602) the final and mortal struggle began (see Persia, History, section viii. "The Sassanian Empire"). Throughout the incompetent reign of Phocas the eastern provinces were overrun by the Persians, as the Illyrian were overrun by the Slavs. The unpopular rule of this cruel usurper was terminated in 610 by the intervention of the governor of Africa, whose son Heraclius sailed to Constantinople and, welcomed by an influential party, met with little resistance. Phocas, murderer of Maurice, was murdered by the people, and the victor was crowned emperor to find himself in possession of a desperate situation. Antioch, Damascus and many other great cities were captured by the Persians; and in 614 Jerusalem was destroyed and the Holy Cross, along with the patriarch, carried off to Ctesiphon. This event produced a profound sensation in Christendom. In 616 Egypt was conquered. The army had fallen into utter disorder under Phocas, and Heraclius so deeply despairs of saving Constantinople that he thought of transferring the imperial capital to Carthage. But the extreme gravity of the situation seems to have wrought a moral change among his subjects; the patriarch Sergius was the mouthpiece of a widespread movement, and the clergy and people "decided that that" Heraclius performed the task of creating a capable army. His efforts were rewarded in a series of brilliant campaigns (622—28), which, in the emphasis laid on the contrast between Christianity and fire-worship and on the object of recovering the Cross, had the character of crusades. Heraclius recovered his provinces and held Persia at his mercy (decisive battle at Nineveh, end of 627).

This war is remarkable for the attempt of the Persians to take Constantinople (626) in conjunction with the Avars and Slavs. Soon afterwards the Avar power began to decay, and the Slavs and Bulgarians shook off their yoke. It seemed as if the Roman government would now be able to regain the control in the Illyrian lands which it had almost entirely lost. It seems probable that Heraclius came to terms with the Slavs—Croations and Servians—in the north-west; their position was regularized, as vassals of the Empire. But fate allowed no breathing-time to do more; the darkest hour had hardly passed when a new storm-cloud, from an unexpected quarter, overthrew the heavens.

XXIII. 17
At this point we have to note that the Hellenic element in the state had definitely gained the upper hand before the end of the 6th century, and that henceforward the Empire might be described as Greek. Justinian's mother-tongue was Latin, and he was devoted to the Latin traditions of Rome, but even he found it necessary to publish his later laws in Greek, and from his reign Greek was the official language.

Many of the Latin official terms were already represented by Greek equivalents (στασις = consilium, ἑπιτροπή = praefectus, &c.), but they were preserved in great numbers, transliterated and often corrupted (e.g. κύμη, μέγαρον, αθηνά = αὐτέρκεια, κακοτάξιον, παράσυρος = παρασύρος, ἥπαξ πελοτικόν, διάφιλον, διάφωνον = διαφωνίαν). Πρέζ, was always used of barbarian potentates, βασιλέως being reserved as = the emperor (but also applied to the Persian king). In military drill many Latin words of command continued to be used.

It must be noted that the year 600 marks the beginning of a period of literary (and artistic) sterility in the Greek world (see Greek Literature, section Byzantine).

With the rise of Islam (see CALIPHATE; Mahomet) two universal religions, for the first time, stood face to face, each aspiring to win the universe. The struggle therefore which then began was not only a new phase of the "Eternal Question," the strife between Europe and Asia, but was one in which the religious element was fundamental. Fire-worship was a national religion and did not present the danger of Islam. The creation of the political power of the Mahomedans was so sudden that it took the world by surprise. Bosra, the fortress of Roman Arabia, fell into their hands in 634, and before the death of Heraclius in 641 they had conquered Syria and all Egypt except Alexandria, which opened its gates to them. The religious alienation of the Syrian and Egyptian peoples from Constantinople, expressing as it did a national sentiment antagonistic to the Greeks, was an important political factor in the Mahomedan (as in the previous Persian) conquest. Thus the Mahomedans definitely cut the Empire short in the East, as the Germans had cut it short in the West; Egypt was never recovered, Syria only for short periods and partially, while the integrity of Asia Minor was constantly menaced and Cilicia occupied for many generations. By their conquest of Persia the Caliphs succeeded to the position of the Sassanids; this led to the conquest of Armenia (c. 654); while, in the West, Africa was occupied in 647 (though the conquest was not completed till the capture of Carthage and other strong places in 698). Thus within twenty years from the first attack the Empire was girt about by the new aggressive power from the precincts of the Caucasus to the western Mediterranean.

Fortunately Constans II, grandson of Heraclius, was a man of eminent ability and firmness. The state owed to him the preservation of Asia Minor, and the creation of a powerful fleet (see below) which protected the Aegean coasts and islands against the naval power which the Mahomedans created. He was responsible for completing a new, efficient military organization, which determined the lines of the administrative reforms of Leo III. (see below). In his last years he turned his eyes to Italy and Africa. He dreamed of restoring Old Rome as the centre of the Empire. But he did not succeed in recovering south Italy from the Lombards (Duchy of Beneventum), and having visited Rome he took up his residence in Syracuse, where he was assassinated, having lost two fleets which he sent against the Arabs of Africa. The strain lasted for another fifty years. Constantinople sustained two great sieges, which stand out as crises, for, if in either case the enemy had been successful, the Empire was doomed.

The first siege was in 673-77, under the caliph Moawiya; his fleet blockaded the capital for five years, but all its efforts were frustrated by the able precautions of Constantine IV.; "Greek fire" (see below) played an important part in the defence; and the army, after a voyage back to Syria by storms and the Roman fleet. The second siege was at the accession of Leo III., when the city was besieged by land and sea by Suleiman for a year (717-18), and Leo's brilliant defence, again aided by Greek fire, saved Europe. This crisis marks the highest point of Mahomedan aggression, which never again caused the Empire to tremble for its existence.

The Heraclian dynasty, which had fallen on evil times and rendered inestimable services to the Empire, came to an end in anarchy, which was terminated by the elevation of the Syrian (commonly called Isaurian) Leo III., whose reign opens a new period. His reforming hand was active in every sphere of government, but the ill-fame which he won by his iconoclastic policy obscured in the memory of posterity the capital importance of his work. His provincial organization was revolutionary, and his legislation departed from the Roman tradition (see below). From his reign to the middle of the roth century the continuous warfare by land with the Caliphis consisted of marauding expeditions of each power into the other's territory, captures of fortresses, guerilla fighting, but no great conquests or decisive battles. The efficiency of the army was carefully maintained, but the neglect of the navy led to the losses of Crete (conquered by Moslem adventurers from Spain in 826) and Sicily (conquered by the Saracens of Africa), Panormus taken 872, Syracuse 878 (see Sicily). The Africans also made temporary conquests, including Bari, in south Italy. This period saw the loss of the exarchate of Ravenna to the Lombards (750), the expansion of the Frankish power under Pippin and Charlemagne in Italy, and in close connexion therewith the loss of Old Rome.

The iconoclast emperors pursued a moderate foreign policy, consolidating the Empire within its contracted limits; but under the "Macedonian" dynasty, which was of Armenian descent, it again expanded and became the strongest power in Europe. The 9th century also witnessed a revival of learning and culture which had been in eclipse for two centuries. The reign of Basil I. was marked by an energetic policy in south Italy, where his forces co-operated with the western emperor Louis II. The Saracens were expelled from their strongholds. Bari recovered, Calabria saved, and the new province (Theme) of Longibardia formed. This secured the entrance to the Adriatic, and the increase of dominion here at the expense of the Lombards was a compensation for the loss of Sicily. Leo VI. did much for reorganizing the navy, but his reign was not fortunate; Saracen pirates plundered freely in the Aegean and, under the able regenero Leo of Tripolis, captured Thessalonica and carried off countless captives (924). But a great tide of success began fifty years later. Nicephorus Phocas won back Crete (961) as general of Romanus II., and then as emperor recovered Cilicia and North Syria (with Antioch) 968. Cyprus was also recovered. The tide flowed on under his equally able successor, John Zimisces (of Armenian race) and under Basil II.; these reigns mark the decisive victory of the Empire in the long struggle with the Saracens, whose empire had been broken up into separate states. The eastern frontier was strengthened by the active policy of Basil II. in Armenia, which was more fully incorporated in the Empire under Constantine IX.

The reign of Basil II. marks the culmination of the power of the Eastern Empire, for it also witnessed the triumphant conclusion of another conflict which had lasted almost as long. In the reign of Constantine IV. the Bulgarians (see BULGARIA) had founded a kingdom in Lower Moesia, reducing the Slavonic tribes who had occupied the country, but less than two centuries sufficed to assimilate the conquerors to the conquered, and to give Bulgaria the character of a Slavonic state. The reign of Constantine V. was marked by continuous war with this enemy, and Nicephorus I. lost his life in a Bulgarian campaign. This disaster was followed up by Prince Krum, who besieged Constantinople in 814. His death was followed by a long peace. Prince Boris was converted to Christianity (reign of Michael III.); a metropolitan see of Bulgaria was founded, dependent on the patriarchate of Constantinople; and the "civilization of the Bulgarians, and beginnings of their literature, were entirely under Byzantine influence. The conversion was contemporary with the work of the two missionaries Cyril and Methodius, who (while the field of their personal activity was in Great Moravia and
Pannonia) laid the south-eastern Slavs under a deep debt by inventing the Glagolitic (q.v.), not the so-called " Cyrillic " alphabet (based on Greek cursive) and translating parts of the Scriptures into Slavonic (the dialect of the Slavs of Macedonia).

The most brilliant period of the old Bulgarian kingdom was the reign of Simeon (893-927), who extended the realm westward to the shores of the Adriatic and took the title " Tsar [i.e. Caesar] of Bulgaria and autocrat of the Romans. " The aggression against the Empire which marked his ambitious reign ceased under his successor Peter, who married a daughter of Romanus I., and the Bulgarian Patriarchate founded by Simeon was recognized at Byzantium. But the Byzantine rulers only waited for a favourable time to reduce this formidable Slavonic state. At length Zimisces subjugated eastern Bulgaria and recovered the Danube frontier. But while Basil II. was engaged in contending with rivals, the heroic Samuel (of the Shishmanid family) restored the Bulgarian power and reduced the Servians. After a long and arduous war of fourteen years Basil (called the " Bulgar-slayer") subdued all Bulgaria western and eastern (1018). He treated the conquered people with moderation, leaving them their political institutions and their autocephalous church, and to the nobility their privileged condition. But members of the royal house were incorporated in the Greek nobility; there was Shishmanid blood in the families of Comnenus and Ducas. Greek domination was now established in the peninsula for more than 150 years. The Slavs of Greece had in the middle of the 4th century been brought under the control of the government.

In the reign of Basil II. the Russian question also was settled. The Russian state (see Russia) had been founded before the middle of the 4th century by Norsemen from Sweden, who were known in eastern Europe as Russians ('Pãs), with its centres at Novgorod and Kiev. They did for the eastern Slavs what the Bulgarians had done for the Slavs of Moesia. The Dnieper and Dniester gave them access to the Euxine, and the Empire was exposed to their maritime attacks (Constantinople was in extreme danger in 860 and 947), which recall the Gothic expedi-
tions of the 3rd century. In 945 a commercial treaty was concluded, and the visit of the princess Olga to Byzantium (towards the end of the reign of the learned emperor Constant-

The conquest of Bulgaria made the Petchenegs immediate neighbours of the Empire, and during the 11th century the depredations of these irreclaimable savages, who filtered into the Balkan peninsula, constantly preoccupied the government. In 1064 they were driven from the Dniester regions into Little Walachia by the Kuman (or Polovtsi), a people of the same ethnical group as themselves. They were

...
the Empire was threatened by their projects of conquest beyond the
Adriatic, projects which aimed at Constantinople itself.

Four great attempts against the Empire were made by the
Normans; they were unsuccessful, but they heralded the Western
conquest of 1204. (1) Expedition of Robert Guiscard, 1081–85,
repelled by Alexius with help of Venice (2) Bohemond’s ex-
pedition, 1105–7, foiled by the able strategy of Alexius; (3) the
invasion of Greece by Roger of Sicily, 1147; Venice, under
Manuel Comnenus, and the Normans were driven from Corfu, 1149;
(4) the expedition of William II. of Sicily, 1185, who succeeded
in capturing Thessalonica; the invaders were defeated at Demetrias,
but they gained the islands of Cephalenia and Zancus.

The two most important events in the reign of Alexius were
the prices which he paid for help against his enemies. (1) He
was obliged (1084) to grant to Venice (which had become
independent of the Empire in the 9th century; see VENICE),
in return for her naval aid against the Normans, commercial
privileges which practically made the Empire commercially
dependent on the Republic. (2) He sought auxiliary forces in
western Europe to help him against the Seljukis; the answer
of the pope and Latin Christendom was the First Crusade—
a succour very different from that which he desired. Through
his intervention the sultan of the Empire bargained through
the dangers with which the disorderly hosts of barbarous allies
menaced it, and the immediate results were salutary; large
parts of Asia Minor, including Nicea, were restored to the
Empire, which was thus greatly strengthened in the East while
the Turks were weakened (see CRUSADES). But for this help
Byzantium might not have recovered the transient strength
and brilliance which it displayed under Manuel. In Asia Minor
the crusaders kept the terms of their agreement to restore to
the emperor what had belonged to him; but on capturing
Antioch (1098) they permitted the Norman Bohemond to retain
it, in flagrant violation of their oaths; for to Antioch if to any
place the emperor had a right, as it had been his a few years
before. This was in itself sufficient to cause a breach between
Byzantium and the Latin kingdom of Jerusalem (founded 1099).
But otherwise the new political situation created by the Crusade
was dangerous, ultimately fatal, to the Empire. For its lands
and seas became a highway from western Europe to the Latin
colonies in Syria; the Byzantine government was forced to
make precautions to protect itself against the crusading expedi-
tions which travelled to the Holy Land; and these precautions
were regarded by the western powers as a hindrance to the
sacred objects of the crusades. The bitter religious antagonism
between the Greek and Latin Christians increased the mutual
distrust and the danger.

The history of the new relations between East and West
dating from the First Crusade is closely connected with the
history of the futile attempts at bringing about a reunion
between the Greek and Latin Churches, which had severed
communion in 1054 (see below). To heal the schism and bring
the Greek Church under the domination of Rome was a principal
object of papal policy from Gregory VII. forward. The popes
alternated between two methods for attaining this, as circum-
stances dictated: namely, a peaceful agreement—the policy of
union; and, in the case of armed occupation of the Empire by some
western power (the Normans)—the policy of conquest. Their views
varied according to the vicissitudes of their political situation
and their struggles with the western emperors. The eastern
emperors were also constantly preoccupied with the idea of
reconciliation, constantly negotiating with a view to union;
but they did not care about it for its own sake, but only for
political advantages which it might bring, and their subjects
were bitterly opposed to it. Manuel Comnenus during the first
part of his reign was the close friend and ally of the western
emperor Conrad III., but after Conrad’s death, he formed
the ambitious plan of realizing in Europe a sovereignty like that
of Justinian, and hoped to compass it in conjunction with Rome,
the enemy of the Hohenstaufen. His forward policy carried
war into Italy; he seized Ancona. But his strength was
unequal to such designs. His Latin sympathies, no less than
his financial extravagance, made him highly unpopular at
home; and the national lack of sympathy with his Western
policy was exhibited—after the revolution which overthrew
his son Alexius and raised his cousin Andronicus I. to the throne
—by the awful massacre of the Latin residents at Constanti-
nople in 1182, for which the expedition of William of Sicily (see
above) and the massacre of the people of Thessalonica was the
revenge. The short reign of the wicked and brilliant Andronicus
was in all respects a reaction, prudent, economical and popular.
His fall was due to the aristocracy against whom his policy
was directed, and the reign of Isaac Angelus undid his efforts
and completed the ruin of the state. Oppressive taxation
caused a revolt of the Bulgarian and Walachian population
in the European provinces; the work of Zizim and Basil was
undone, and a new Bulgarian kingdom was founded by John
Asen—a decisive blow to the Greek predominance which the
Macedonian emperors seemed to have established.

In the fatal year 1204 the perils with which the eastward
expansion of western Christendom (the Crusades, and the
commercial predominance and ambitions of Venice) had long
menaced the Empire, culminated in its conquest and partition.
It was due to a series of accidents that the cloud burst at this
moment, but the conditions of such a catastrophe had long
been present. Isaac Angelus was dethroned by his brother
Alexius III., and his son escaped (1201) to the west, where
arrangements were being made for a new crusade, which Venice
undertook to transport to the Holy Land. The prince persuaded
Philip of Swabia (who had married his sister) and Boniface
of Montferrat to divert the expedition to Byzantium, in order
to restore his father and himself to the throne, promising to furnish
help to the Crusade and to reconcile the Greek Church with
Rome; Venice agreed to the plan; but Pope Innocent III., the
enemy of Philip, forbade it. Isaac and his son, Alexius IV.,
were restored without difficulty in 1203, and the crusading
forces were prepared to proceed to Palestine, if Alexius had
performed his promises. But the manner of this restoration,
under Latin auspices, was intensely unpopular; he was not
willing, but he was unable, to fulfil his pledges; and a few
months later he was overthrown in favour of one who, if an
upstart, was a patriot, Alexius V. Then the Crusaders, who
were waiting encamped outside the city, resolved to carry out
the design which the Normans had repeatedly attempted, and
put an end to the Greek Empire. The leaders of the Fourth
Crusade must be acquitted of having formed this plan
deliberately before they started; it was not conceived before
1204. They first arranged how they would divide the Empire
amongst themselves (March); then they captured the city,
which had to endure the worst barbarities of war. In par-
titioning the Empire, which was now to become the spoil of
the conquerors, the guiding mind was the Venetian leader,
the blind doge, Henry Dandolo. He looked to the interests
of Venice from the narrowest point of view, and in founding
the new Latin Empire, which was to replace the Greek, it was his
aim that it should be feasible, so as to present no obstacles to
Venetian policy. The Latin Empire of Romania was a feudal
state under the rule of the Hohenstaufen, whose kings
themselves of all the princes who established themselves on Greek
territory; under his own immediate rule were Constantinople,
Thrace, the Bithynian coast, and some islands in the Aegean.
But he was hampered from the beginning by dependence on
Venice, want of financial resources, and want of a fleet; the
feudal princes, occupied with their separate interests, gave him
little support in his conflict with Greeks and Bulgarians; at
the end of ten years the worthless fabric began rapidly to
decline, and the efforts of the popes, for whom it was the means
of realizing Roman supremacy in the East, were unavailing
to save it from the extinction to which it was doomed in its cradle.

The original Act of Partition (which gave ⅓ of the Byzantine
territory to the future emperor, ⅔ to Venice, the remaining ⅓
to the Crusaders) could hardly be carried out strictly, as the territory
was still to be won. The most important vassal state was the
kingdom of Thessalonica, including Thessaly, which was assigned
to Boniface of Montferrat. But it was conquered by the Greeks
of Epirus in 1222. The chief of the territories taken by Venice
was Crete. For the Latin states in Greece and the Aegean see Greece. The first Latin emperor, Baldwin of Flanders, was captured and put to death by the Bulgarians in 1205. He was succeeded by his brother Henry, an able statesman, after whose death (1216) the decline was rapid.

Three Greek states emerged from the ruin of the Roman Empire. A member of the Comnenian house had founded an independent state at Trebizond, and this empire survived till 1461, when it was conquered by the Ottomans. A relation of the Angeli maintained in Europe an independent Greek state known as the Despotate of Epirus. But the true representative of the imperial line was Theodore Lascaris, who collected the Byzantine aristocracy at Nicaea and was elected emperor in 1206. He and his successors advanced surely and rapidly against the Latin Empire, both in Europe and Asia. It was a question whether Constantine would fall to the Walacho-Bulgarians or to the Greeks. But an astute diplomat and general, the emperor Michael Palaeologus, captured it in 1261. His object was to recover all the lost territory from the Latins, and he was menaced by a great danger through Charles of Anjou, who had overthrown the rule of the Hohenstaufens in the two Sicilies, and determined to restore the Latin kingdom of Sicily. To avert this peril, Michael negotiated with Pope Gregory X.; he was ready to make every concession, and a formal union of the Churches was actually brought about at the council of Lyons in 1274. The emperor had the utmost difficulty in carrying through this policy in face of clerical opposition; it is said that he himself was divorced by his first wife, and that he was undone by his successor. Meanwhile the pope had with difficulty bridled Charles of Anjou; but in Martin IV. he found a more pliable instrument, and in 1282 he made vast preparations for an expedition against the Greek Empire. It was saved by the Sicilian Vespers (see Sicily), to be the prey of other powers.

The end of the 13th century saw the rise of the Ottoman power in Asia and the Servian in Europe. The Empire was assailed by a band of Spanish mercenaries (the Catalan Grand Company; see Greece, History, “Byzantine Period”) against the advance of the Ottoman Turks in Asia Minor; they distinguished themselves by saving Philadelphia (1304). In 1326 Brusa (Frusa) became the Ottoman capital, while on the other side the Servians (crushing the Bulgarians in 1330) were gradually closing in on Byzantium. Under Stephen Dušan (1331–1355) Servia attained the height of her power. The enemies were strengthened by the domestic struggles within the Empire, first between Andronicus II. and his son, then between John VI. and the usurper Cantacuzenus. But before the fate of Byzantium was settled the two enemies on its flanks came face to face. In 1387 the Servian power was crushed on the field of Kosovo by the Ottomans (who had crossed the Hellespont in 1356 and taken Philippolis in 1363). Sultan Bayezid I. won Philadelphia, the last Asiatic possession of the Empire, and conquered Trnovo, the Bulgarian capital, in 1393. Constantinople was now surrounded. The Ottoman power was momentarily eclipsed, and the career of conquest checked, by the Mongol invasion of Timur and the great defeat which it sustained in the battle of Angora (1402). Mahommed I. found it necessary to ally himself with the emperor Manuel. But the pause was brief. Murad II. took Adrianople, and tried (1422) to take Constantinople.

It was small compensation that during this time the Palaeologoi had been successful against the Franks in Greece. The situation was desperate. The Turks were in possession of the Balkan peninsula, threatening Hungary; there was no chance of rescue, except from western Europe. John VI. and Manuel had both visited the West in search of help. The jealousy of the Empire was the opportunity of Rome, and the union of the Churches became the pressing question. It was taken up earnestly by Pope Eugenius IV., and the result was the Decree of Union at the council of Florence in 1439. The emperor and the higher clergy were really in earnest, but the people and the monks did not accept it, and the last agony of Byzantium was marked by ecclesiastical quarrels. Eugenius IV. preached a crusade for the rescue of the Empire, and in 1443 an army of Hungarians and Poles, led by the Hungarian king, won a victory over Murad, which was more than avenged in the next year in the memorable field of Varna. The end came nine years later under Murad's successor, Mahommed II. An army of about 150,000 blockaded the city by land and sea, and Mahommed began the siege on the 7th of April. The emperor Constantine XI. Palaeologus, on whom the task of the forlorn defence devolved (and whose position was all the more difficult because he was alienated from his subjects, having embraced the Latin rite), can have had little more than 8000 men at his disposal; he received no help from the Western powers; but an experienced Genoese soldier of fortune, John Justiniani, arrived with two vessels and 400 cuirassiers and aided the emperor with his courage and advice. The resident foreigners, both Venetians and Genoese, loyally shared in the labours of the defence. The final storm of the land walls took place on the night of the 29th of May. All looked to Justiniani for salvation, and when he, severely wounded, retired from the wall to have his wound looked to, a panic ensued. The enemy seized the moment, and the Janissaries in a final charge rushed the stockade which had been constructed to replace a portion of the wall destroyed by the Turkish cannon. This decided the fate of the city. Constantine fell fighting heroically. Soon after sunrise (May 30) the Mahommedan army entered Constantinople (Stambul = ștîmbul ebu, “the city”), which was in their eyes the capital of Christendom.

The ultimate responsibility for this disaster is generally imputed to the political adventurers who dismembered the Empire and induced the Turks to attack it at that time. But the Byzantine state seemed already stricken with paralysis and verging to dissolution, and it was menaced by the re-arisen power of Bulgaria. But more than once before (in the 7th century and in the 11th) it had recovered its strength when it was weak and in dire peril; and, considering what the emperors of Nicea and Michael VIII. accomplished, it seems probable that, if there had been no Fourth Crusade, it might have so revived and consolidated its forces in the course of the 13th century, as to be able to cope successfully with the first advances of the Ottomans. The true statement is that the Fourth Crusade was only an incident (not in itself decisive) in a world-movement which doomed the Eastern Empire to extinction—namely, the eastward movement of western Europe which began in the 11th century with the rise of the Normans and the First Crusade. Henceforward the Empire was a middle state, pressed between expanding forces on the east and on the west, and its ultimate disappearance was inevitable.

Church and State. In making the state Christian, Constantine made the Church a state institution, and therefore under imperial control. Caesaro-papism was the logical consequence. The sacerdotium was united with the imperium in the person of the monarch as in the pagan state. The Church acquired, and yet did not acquiesce, in this theory. When a heretical emperor sought to impose his views, champions of ecclesiastical freedom never failed to come forward. At the very beginning Athanasius fought for the independence of the Church against the emperor Constantius. But the political principle which Constantine had taken for granted, and which was an indispensable condition of his adoption of Christianity, was fully recognized under Theodosius I., and, notwithstanding protests from time to time, was permanent. It is significant that Constantine, which had become a second Rome politically, with its senate and capital, became then a second Rome ecclesiastically, and that the elevation of the see of Constantinople to patriarchal rank next to the Roman see was due to Theodosius (381), who gave a permanent form to the dualism of the Empire. The patriarch became a state minister for religion. The character of the Church as a state institution is expressed above all in the synods. The general council are not only summoned by the emperor, but are presided over by him or by his lay deputies. The order of the proceedings is modelled on that of the senate. The emperor or his representative not only keeps order but conducts the deliberations and intervenes in the theological debates. It has been erroneously thought that at the council of Chalcedon (451) the legate of Pope Leo presided; but the
acts of that assembly teach us otherwise; the privilege which the Roman legates possessed was that of voting first (the right of the præcipes senatus). The first general council at which a churchman presided was the seventh (at Nicea, 325), at which the emperor (or empress) deputed, not a layman, but the patriarch Tarasius to preside. The resolutions of these ecclesiastical state-councils did not become the law of the Empire till they were confirmed by imperial edicts.

The emperors, in their capacity as heads of the Church, did not confine themselves to controlling it by controlling the councils. They soon began to issue edicts dealing with theology, by virtue of their own authority. It has been said that the council of Chalcedon closed an epoch of "parliamentary constitutionalism"; a general council was not summoned again for more than one hundred years, though the Empire during that period was seething with religious disunion and unrest. The usurper Basiliscus in his short reign set an example which his successors were not slow to follow. He issued an edict quashing the decision of Chalcedon. Zeno's Henoticikon (see below) a few years later was the second and more famous example of a method which Justinian largely used, and of which the Ecthesis of Heraclius, the Type of Constans II. and the iconoclastic edicts of Leo III. are well-known instances. It was a question of political expediency (determined by the circumstances, the intensity and nature of the opposition, &c.) whether an emperor supported his policy or not by an ecclesiastical council.

The emperor was always able to control the election of the patriarch, and through him he directed the Church. Sometimes emperor and patriarch collided; but in general the patriarchs were docile instruments, and when they were refractory they could be deposed. There were several means of resistance open to a patriarch, though he rarely availed himself of them. His participation in the ceremony of coronation was indispensable, and he could refuse to crown a new emperor except under certain conditions, and thus dictate a policy (immediately in 812, Michael L.; 969, John Zimisces). There was the power of excommunication (Leo VI. was excommunicated on account of his fourth marriage). Another means of resistance for the Church was to invoke the support of the bishop of Rome, who embodied the principle of ecclesiastical independence and whose see admitted an excellent precedence and primacy over all the sees in Christendom. Up to the end of the 8th century he was a subject of the emperor, and some emperors exerted their ecclesiastical control over Rome by drastic measures (Justinian and Constans II.). But after the conquest of Italy by Charles the Great, the pope was outside the Byzantine domination; after the coronation of Charles in 800 he was associated with a rival empire; and when ecclesiastical controversies arose in the East, the party in opposition was always ready to appeal to him as the highest authority in Christendom. Under the iconoclastic emperors the image-worshippers looked to him as the guardian of orthodoxy.

As to the ecclesiastical controversies which form a leading feature of Byzantine history, their political significance alone concerns us. After the determination of the Arian controversy in 381 new questions (as to the union of the divine and human elements in the person of Christ: one or two natures?) arose, and it may seem surprising that such points of abstruse theology should have awakened universal interest and led to serious consequences. The secret was that they masked national feelings; hence their political importance and the attention which the government was forced to bestow on them. The reviving sense of nationality (anti-Greek) in Syria and in Egypt found expression in the 5th century in passionate monophysitism (the doctrine of one nature): theology was the only sphere in which such feelings could be uttered. The alienation and disunion which thus began had fatal consequences, smoothing the way for the Saracen conquests of those lands; the inhabitants were not unwilling to be severed politically from the Empire. This ultimate danger was at first hardly visible. What immediately troubled the emperors in the first half of the 6th century was the preponderant position which the see of Alexandria occupied, threatening the higher authority of Constantinople. The council of Chalcedon, called by Marcian, an able statesman, was as much for the purpose of ending the domination of Alexandria as of settling the theological question. The former object was effected, but the theological decision of the council was fatal, it only sealed and promoted the disunion. The recalcitrant spirit of Syria and Egypt forced Zeno, thirty years later, to issue his Henoticikon, affirming the decisions of previous councils but pointedly ignoring Chalcedon. This statesman-like document secured peace in the East for a generation. Rome refused to accept the Henoticikon, and when Justinian resolved to restore imperial supremacy in the Western kingdoms, conciliation with Rome became a matter of political importance. For the sake of this project, the unity of the East was sacrificed. The doctrine of Chalcedon was reasserted, the Henoticikon set aside; New Rome and Old Rome were again hand in hand. This meant the final alienation of Egypt and Syria. The national instinct which had been alive in the 5th century grew into strong national sentiment in the 6th. One of the chief anxieties of Justinian's long and busy reign was to repair the mischief. Deeply interested himself in matters of dogma, and prepared to assert to its fullest extent his authority as head of the Church, he has been called "the passionate theologian on the throne"; but in his chief ecclesiastical and political considerations were predominant. His wife Theodora was a monophysite, and he permitted her to extend her protection to the heretics. He sought new formulae for the purpose of reconciliation, but nothing short of repudiation of the Chalcedon acts would have been enough.
